7202. The land revenue would increase slowly and not automatically?—Practically automatically. With the reduced purchasing power of the rupee the producer would get more rupees for his produce, the Government in valuing his land would get a higher rate in rupees and would draw a higher revenue from it.

7203. It would not be automatic; the Government would have to take the important step of raising the revenue?—That is true. It would be automatic, but not all at once.

7204. It would come gradually?—It would come gradually.

7205. In the case of the opium revenue, that is the opium which is sold in Calcutta—the increase of revenue would be automatic, because you would sell opium for a greater number of rupees?—Yes.

7206. In the case of the land revenue the Government would have to go through the process of raising the revenue, but, as you say, the Government would have good ground for doing so?—Yes.

7207. Anything else?—The railways belong to the Government; the canals belong to the Government. The revenue of those would automatically be increased with the decline in the purchasing power of the metal.

7208. Do you mean that there would be more irrigation and more railway freight?—Undoubtedly, and the Government, if the rupee had a lower purchasing power, would be perfectly justified in increasing the rates.

7209. Those are three sources of increase; is there anything else? I want to know how you would find the whole of the revenue necessary to meet the additional expenditure?—I say you would be perfectly justified in increasing the salt duty. That is a matter that is quite misunderstood in England. The salt duty is 4*d.* per head of the population. It is in the nature of a poll tax, and it is the only taxation that the poor native pays, and he does not feel it. After many years experience in India, I have never known a native who objected to the salt tax; they will object to everything else but the salt tax.

7210. But all that, at any rate in the first instance, would not give you anything like the amount of the total additional expenditure?—Even assuming that you were to meet with some temporary loss, I contend that your land revenue ultimately would be sufficient to pay off the whole of your indebtedness, and that would increase automatically according to the depreciation in the purchasing power of the rupee. While that adjustment was going on you might have some loss, but that would be nothing compared with the loss you have got to face the other way.

7211. Would you increase the import duties?—I do not like duties, but if it were absolutely necessary, that is one way of doing it.

7212. That is not an unpopular form of taxation in India?—No.

7213. (*Sir J. Muir.*) And export duties?—I have a great objection to export duties. I would rather see revenue raised in almost any other form. Export duties on raw produce I think at this time of day are not a thing that any enlightened Government would propose.

7214. (*Sir D. Barbour.*) As to the raising of the railway rates, and the irrigation rates, if you had to do it under the circumstances that you explained, it might be justifiable, but it is better that they should not be raised?—Undoubtedly.

7215. It would be better to avoid it if possible?—I quite agree.

7216. And it would be better not to raise the salt duty if you could avoid it?—If you show such excessive deference to the opinion of people in England who really do not understand the matter.

7217. Is it deference to their opinion, or considerations for the welfare of the people?—There is a great deal of misapprehension about the salt duty. The poor Indian buys his food and his little stores at the village shop twice a week. That is to say he makes a hundred purchases in a year. The dealer generally gives him a pinch of salt for nothing along with the

little stores that he buys. At any rate if he pays for his salt, he pays 4*d.*, and that is divided by 100. It cannot be represented by the smallest coin in the world. A few cowries might pay for the proportion of salt that he buys. It is 4*d.* a head per annum, and no more. It comes to nothing.

7218. Do you think the whole population of India buy their food in that way twice a week?—The poor—the only people for whom you can have any consideration in talking of a duty of 4*d.* a head

7219. Do you think the agriculturists do that, or do they consume the food that they grow themselves?—The agriculturist is in a different position. He is profiting all the time and he can well afford it.

7220. But you said that the population of India bought their food twice a week?—I was referring there to the poor population of India, the only people for whom you can have any consideration in discussing the salt duty.

7221. But many agriculturists are poor?—There may be such, and if they are poor they will buy salt just the same as the other people.

7222. And therefore they pay the higher price?—That is probably so.

7223. Now do you think wages have doubled in Bengal, because it is quite contrary to the evidence we have had?—I say that the wages of agricultural labour in Lower and Eastern Bengal have doubled.

7224. I do not know Eastern Bengal, but do you think that wages generally in India have doubled?—I do not, I think in the prosperous provinces they have, but not in some of the congested districts.

7225. A friend of mine tells me that he paid the men who looks after his horses 3 rupees 8 annas per month at a place where he was magistrate, and there had been a railway there for ten years at least. Do you think that shows any sign of a rise?—I have never got anybody to serve me at 3 rupees 8 annas a month.

7226. Neither have I, but, if that statement be correct, that does not show any signs of a rise in that district?—It must have been in a congested district.

7227. Certainly there is a large population in that district and wages are low?—There are exceptional districts in India as in Ireland, where people want to live on the land where it can hardly support them, and they will not go away. Undoubtedly there are those exceptional places.

7228. Have you examined the Government statistics of wages?—Not recently.

7229. They do not show a 50 per cent. rise all round?—Probably not, but I do not think the Government statistics are always right.

7230. You said if the mints had been open for the last five years, you think India would have coined 30 crores of rupees. Do you mean 30 crores in all?—I corrected myself by saying that probably, instead of coining six crores annually she would have coined eight crores, but two crores might be melted up.

7231. Do you know that just before the mints were closed, India was taking an average of about 12 crores a year?—Yes.

7232. Most of which was coined?—Yes.

7233. But if silver had fallen, would she not have taken very considerably more?—If silver had fallen to the present point probably, but I do not think silver would have gone so low. I was trying to put a moderate figure, but I said that I thought she would add to her currency at six crores a year.

7234. India was coining much more than six crores a year before the mints were closed?—Part of it was melted up.

7235. Now if the Americans had ceased purchasing, do you not think that India would have had to coin much more than 12 crores a year?—It depends on the price of silver.

7236. When the Americans stopped purchasing, the price of silver must have fallen?—But not so low.

7237. I do not say that, but it would have fallen lower than at the time the mints were closed. Do you not think she must have taken more than 12 crores a year if the mints had not been closed in 1893?—She would have taken a great deal. I am not prepared to place any limit.

7238. She must have taken all that was offered to her at the price of the day as long as the mints were open?—Yes.

7239. You said that the rupee fell in sympathy with silver when the mints were closed. How does that sympathy act that makes the one thing fall with the other?—Well, there was a very strong conviction amongst the natives that the mints would have to be opened again. That, I think, accounts in a great measure for the large importation of bar silver; the natives thought, "The Government cannot "keep the mints closed, they will have to open "then again and we will have the silver ready."

7240. That large importation only went on for some months; that could not have been the cause that kept the rupee down after the excessive importation of silver was over?—There is no doubt that for a time there was sufficient to go on with, and there was no scarcity for some time after the mints were closed. It has only begun during the last two years.

7241. But why should the rupee have fallen in sympathy with silver? How does the question of sympathy come in?—I think people know the intrinsic value of the rupee is not more than 1*s.* ½*d.*, and why should they give more money for it?

7242. It has been said that there is a connexion between the exchange value of the rupee and the rate of discount and the rate of exchange. Do you think the two things go together? I daresay you know that many economists say that the rate of discount or interest has nothing to do with the appreciation or depreciation of the standard?—I do not think it has. It depends on the amount of loanable capital available.

7243. What do you think are the causes of the high rate of discount and the high rate of interest in India at the present time?—The fact that capitalists have all sent their money away. They thought they were getting good terms for remitting it home.

7244. That is to say they were afraid that this rate of exchange could not be maintained?—They were convinced that it could not be maintained. The point is this: they had nothing to lose by sending their money home at 1*s.* 4*d.*, because it cannot go higher.

7245. They had the high rate of interest to lose which they could get in India?—But you have the rate fixed. You say the rupee cannot go beyond 1*s.* 4*d.* on account of the action of the Government. Then a man naturally says it is "heads I win, tails you lose." I get my 1*s.* 4*d.* I cannot get more, and if things go the wrong way I may lose 30 per cent. of my capital.

7246. Do you think there is any other cause of the remittance of capital from India than the desire to take advantage of the high rate of exchange?—I think that is the chief cause.

7247. And, if there was confidence, that cause would not operate?—Certainly not, if there was absolute confidence.

7248. On the other hand, if this high rate of discount went on every year some persons might be found who would run the risk of keeping their money there for the sake of the high rate of interest?—Not unless the rate was so high as practically to extinguish all industries in India.

7249. It would depend on the fear of the fall of exchange. If they had not much fear of the fall of exchange they might be content to risk it for the sake of the high rate of interest?—It would depend on how high the rate was, and what fear they had of a fall of exchange.

7250. (*Sir C. Crosthwaite.*) Have you considered what amount of extra taxation would be necessary if the rupee were allowed to fall, say, to 1*s.*?—I have not considered it exactly, but I think, as I have

Mr. R. Steel, C.S.I.
19 July 1898.

explained to Sir D. Barbour, a good deal of it would be automatically recovered.

7251. But you cannot tell me about what amount you think would be necessary?—I think it is impossible for any one to say exactly. I think the amount has been terribly exaggerated by some people.

(*Chairman.*) You may take it at from 12 to 14 crores.

7252. (*Sir D. Barbour.*) From 1*s.* 4*d.* to 1*s.* would mean that?—I would not be prepared to admit even that, because what the Government calls the loss by exchange is not all loss by exchange.

7253. This is the additional number of rupees that would be required, putting aside the question of loss altogether. If at 1*s.* 4*d.* so many rupees are required to meet the Government liabilities, then at 1*s.* it will require, say, 12 crores more?—I have no doubt you have made the calculation correctly.

7254. (*Chairman.*) The rise in exchange during the last year has enabled the Government of India and the Secretary of State to avoid imposing additional taxation in order to meet the greater portion of the heavy expenditure on the war and the famine?—But it has in effect been itself additional taxation.

7255. That is another matter. I am only clearing up Sir Charles Crosthwaite's point. If the rupee goes down to 1*s.*, as Sir D. Barbour says, there will have to be a certain additional number of rupees to the extent of 12 crores found by taxation?—I have no doubt that is correctly calculated.

7256. (*Sir C. Crosthwaite.*) Apart from that, you think that a large portion of it at any rate could be got by increasing the land revenue?—I think so.

7257. Can you calculate the amount of the land revenue?—I think it is about 26 crores of rupees in round numbers.

7258. Of that part is permanently settled?—A small part of the revenue—a considerable part of the ground.

7259. The revenue permanently settled is about six crores, I think?—Less than that, I think.

7260. In the North-West Province and Madras, too?—Yes, I was thinking only of Bengal.

7261. That revenue could not be raised, could it?—It could not be raised in that form.

7262. You do not recommend that there should be a breach of the permanent settlement?—Not at all. The position of a Zemindar under a permanent settlement is the position practically of owner of the soil subject to a rent charge. We cannot increase his rent charge, but there is no reason why that Zemindar should not be liable to pay taxation like everybody else for the cost of the Government. As a matter of fact he is—for what reason nobody knows—exempted from paying income tax. It is an extraordinary anomaly that the richest class in India, the Zemindars, have to pay no income tax; it seems to me indefensible. You cannot break his permanent settlement, but the fact that he is under permanent settlement does not change his status as a member of the community who should pay proper taxation to meet the charges of the State.

7263. Is it not the case that a good many local rates have been put on of late?—They have been subjected to what they call the public works cess, I think, but that public works cess is for money which is to be spent for improving the conditions of the soil, the roads, and so forth.

7264. You said that the land revenue was the share of the produce that the Government took?—Yes.

7265. Can you tell me what share of the produce is taken?—I believe it varies in different parts of the country, and I am sure you are able to say much more accurately than I can. I think it is something like 40 per cent. in the North-West Provinces.

7266. It is a share of the produce?—It is a share of the produce.

7267. In the North-West Provinces it is not a share of the produce, it is a share of the rent. The settlement is not made with the actual cultivator or producer, it is made with the landlord or owner of the soil as a rule?—But the rent depends upon the produce of the soil. Therefore, if it is a settlement on the land, it is practically indirectly a settlement on the produce of the soil.

7268. Indirectly, no doubt, but you are aware that there are rent laws, and that there are a large proportion of tenants who are hereditary?—Yes, there are occupancy rights, and so on.

7269. Now, with regard to agricultural wages, are they paid, as a rule, in kind or in cash?—They are generally paid partly in one and partly in the other, I think, in Bengal, at any rate.

7270. So that part of the rise which you allude to would be in consequence of the increased price of the food grains in which they are paid?—Yes.

7271. (*Sir A. Dent.*) As to wages in Darjeeling, you said that the price of rice had been permanently fixed at three rupees per maund?—It is a part of the contract between the tea planter and the coolie that he gets his rice at a fixed low price.

7272. But that price is not three rupees per maund for ever, is it?—During the continuance of the contract, I believe it is.

7273. In answering the questions put to you by Lord Balfour about your third scheme, I did not understand how long it would take before we got back to the reopening of the mints; would you name any term?—The mints would be open from the moment the scheme started, but the exchange would only fall gradually, because people could not get their silver thrown in and get paid for it without a long interval of time.

7274. And that might go over several years?—I think it might probably go over 18 months or two years.

7275. When you say a very large amount of silver would be poured into the mints at once, and that that would raise the price of silver for the moment, there would be a very unpleasant reaction later on, would there not?—I do not think so.

7276. You think a principal increase of revenue would be on opium?—Yes.

7277. Is not that a very uncertain revenue now?—No doubt.

7278. The Chinese are going in largely for cultivating it?—Very true.

7279. And is not the revenue from opium getting less and less every year, so that it will eventually become extinct?—If exchange goes up it may disappear gradually. If exchange goes down it will continue longer probably.

7280. (*Mr. Holland.*) You told us that in your opinion if the mints were reopened exchange would fall, but that India at large would gain by the fall of exchange?—Yes.

7281. We have had it in evidence from another witness that most of the advantage of a fall of exchange goes into the pockets of the middleman. Do you agree with that opinion?—No.

7282. You think the Government would not be strong enough to carry through their own proposals; do you agree that the task that they have set themselves is difficult in proportion as the rate of exchange is high?—Certainly.

7283. And that although it might be impossible at 1*s.* 4*d.* it might not be impossible at 1*s.* 3*d.*; and if it were impossible at 1*s.* 3*d.*, it might not be impossible at 1*s.* 2*d.*?—The difficulty increases in proportion to the height that you keep it up to. I think it would be impossible at 1*s.* 3*d.* for that matter, although not so impossible, you may say, as at 1*s.* 4*d.*

7284. Do you think it would be impossible at 1*s.* 2*d.*?—I do not care to commit myself to an exact figure.

7285. You are an ex-president of the Bengal Chamber of Commerce?—Yes.

7286. We have had it in evidence from another ex-president of the Bengal Chamber of Commerce that the closing of the mints has not had a serious effect on trade. Do you agree with that?—No.

7287. You think the effect has been serious?—Very serious.

7288. And it has been stated by another witness that, notwithstanding the stringency in the money market, trade has been carried on without any hindrance. I suppose that also you would disagree with?—I should differ from that, certainly.

7289. Do you agree with the Bombay Chamber of Commerce, that the present tightness of money is mainly attributable to the contraction of the currency consequent on the closing of the mints?—Yes.

7290. And do you think that the proposals of the Government of India would have the effect of perpetuating that state of things?—Intensifying and perpetuating it.

7291. (*Mr. Campbell.*) With regard to the fall in silver since the closing of the mints, do you attribute the whole of that fall to the closing of the mints?—A great part of it. I would not say the whole of it.

7292. Are there not at least two other very important factors since the closing of the mints which would affect the fall of the price of silver; first, there was the repeal of the Sherman Act?—Yes.

7293. And secondly the abandonment of a silver standard by Japan?—Yes.

7294. I suppose you would admit that both these factors have a very important effect on the price of silver?—Certainly, but the repeal of the Sherman Act had cast its shadow before. It was already anticipated at the time.

7295. But if the mints had not been closed is it possible that there might not have been some modification instead of a total repeal?—It is possible, yes.

7296. So that the situation is not exactly the same to-day as it was at the time the mints were closed?—No.

7297. There are those two other elements in the question now. Do you think it possible that there might not be other disturbing causes of the same kind in the future?—All the influences that would make silver go up seem to have disappeared with the single exception of the possibility of the re-opening of the Indian Mints.

7298. But if some other silver standard country were to abandon the silver standard and try to get on to gold, that would give another blow to silver would it not?—I do not know what silver standard country is left now.

7299. There is the Straits Settlements, there is China, there is Mexico, there is Spain?—Take Japan for instance. It seems most probable that their scheme will fail and that they will have to return to a silver standard. Austria has got a lot of gold with the idea of establishing a gold standard, but she has not yet ventured to do so. Italy borrowed a large sum of money in order to return to a gold standard, and that has been obliged to be abandoned. It seems that no poor country can maintain its gold standard. It must be a rich country like France or England or America, or a country that keeps heavy tariffs, that is enabled to retain its gold. If you were to make India a protectionist country I believe she would be able to retain her gold, but not otherwise.

7300. Not if she could command the gold over and above the ordinary indebtedness?—I believe it would slip away from her.

7301. Why?—Because I think it would be hoarded, as I explained before.

7302. Do you not think that the mere announcement of the reopening of the mints, even with the qualification that you alluded to, would have the effect of giving a very great shock to trade?—I think it must give a certain amount of shock to trade, but I am afraid if you make a false step, and fall over a precipice, you cannot expect to find yourselves on your legs again without some difficulty and trouble. There is no doubt the closing of the mints is a step that is very difficult to retrace, but there are means of doing it, and I think the only thing that will restore prosperity is the reopening of the mints.

7303. Now, with regard to the suggestion that you make as to giving deferred warrants for the silver sent into the mints. You say you would begin to coin at the rate of 2 lakhs a day?—Yes.

7304. If silver was sent from England it would begin to get in in about four weeks?—Yes.

7305. And would be cashed in a little more than a month?—No, because it would be preceded by a great deal of silver in India.

7306. You estimate that there is as much silver in India as would postpone the payment for these shipments from England for at least 12 months?—I think so.

7307. That would represent about seven crores of rupees?—Take 300 working days in the year at the mint, at two lakhs a day, it would be six crores.

7308. Six crores of silver, the present price of which is 70 rupees per hundred tolas, would mint into more than nine crores of standard coin, would it not?—Yes, but I would take it that six crores of rupees should be minted.

7309. Two lakhs coined every day?—Two lakhs of coin would be produced at the mint each day. Of course that is merely a suggestion, subject to modification.

7310. That would give an enormous profit to the holder of bar silver in India at the present moment?—Yes.

7311. Silver would cost, say, 70 rupees, and would realise about 106?—A portion of that has, of course, cost more.

7312. And a portion has cost less. The present price is about 70. But do you not think that the pouring out of that six crores in the course of the year, in addition to council bills and other moneys that are let loose in India in the course of the year, would have a very important effect on the money market?—Undoubtedly; and I think an advantageous effect on the money market.

7313. And would it not tend to have an important effect on exchange?—Undoubtedly exchange would go lower, and I think silver would go higher, and the object I would have in view would be to bring silver and exchange together, and then things would go smoothly.

7314. As regards silver going higher, Japan has been mentioned. Are you aware that, so long as there are any yens procurable in Japan, the value of the rupee could not rise much above 11*d.*, because it would pay to export the yen to India, and bring gold out from London to pay for it?—That is to say, so long as the yen are going, but I think the question of the yen is a matter of very small importance, and I believe myself that Japan will have to go back to a silver standard; she will not be able to keep her gold.

7315. You said just now that for coinage purposes India is practically the only taker of silver?—She is the principal taker of silver. Of course there are one or two others.

7316. Then there is the British dollar, which is now coined for use in the Straits?—Yes, and there is the subsidiary coinage of various countries.

7317. And China, although she does not coin it, takes silver very largely?—Yes.

7318. Now, going to the Government's proposals, you say you see no sign at present of redundant currency in India?—Certainly not.

7319. On the contrary, the currency, you believe, is contracted?—Yes.

7320. You know the Government say that they only consider currency redundant at the rate of 1*s.* 4*d.*?—Yes.

7321. And then propose to remove that redundancy by melting down a certain number of crores of rupees?—Yes.

7322. Do you consider it a right thing in the interests of Indian trade for the Government to adopt an arbitrary rate of exchange, and proceed to force that rate upon the market by melting down currency?

Mr. R. Steel, C.S.I.

19 July 1898.

—I entirely disapprove of it. I disapprove of all interference by Government with the currency.

7323. I think you said that any attempt to enforce too high a rate of exchange would have a prejudicial effect on trade?—Yes.

7324. And would curtail the trade balances in India's favour required to adjust her foreign indebtedness?—Yes. As far as I know the balance of trade has already diminished, and would tend to diminish.

7325. If that trade balance is diminished to any large extent, would that necessitate sterling borrowing again?—Undoubtedly, if the trade balance disappeared, the Secretary of State would be unable to sell his council bills, and would have to borrow in London.

7326. And of course that would add to the difficulty in the future?—Yes.

7327. It would increase the annual amount of sterling indebtedness still further?—Yes.

7328. (*Mr. Le Marchant.*) If you were to approach open mints by some such system as you were mentioning—a coinage of so many lakhs a day—what effect do you think that would have on trade? Would not the exporter naturally hold back as long as he could for the lower exchange, and the importer rather press forward?—No, I think not. I think it would give a stimulus to business.

7329. You think a gradual fall of exchange would stimulate it?—A gradual fall in the purchasing power of the standard has always the effect of being an advantage to industry as against capital. When the standard of value falls, industry gains—the money-lender loses. In India, for instance, nearly all the agriculturists are indebted to the money-lenders. By artificially raising the value of the rupee, you unquestionably increase the debt of the agriculturist to the money-lenders. I think it is admitted on all hands that a decreased purchasing power of the standard, such as was caused in England in the forties by gold from California and Australia, gives a stimulus, and that is what we want in India. We want to stimulate it in order to provide for the three millions of population which come every year.

7330. Do you think that would stimulate it in the way of introduction of capital?—I am sure it would.

7331. In spite of the probable lower rate of exchange at which that capital might be eventually brought back?—Yes, I should like to say this on that point. Where a capitalist in India can get, say, 5 per cent. more for his money than he can in England, there is a strong inducement for him to send his money out to India. At present he is afraid of losing a large portion of his capital in getting his money home again. If, on the contrary, the mints were opened and silver was allowed to find its natural value, the capitalist would be able to form an idea for himself of the possible fall of exchange, and he would probably come to the conclusion that the fall of exchange, naturally taking place year by year, would be something like 1 per cent. Now, if he is going to get 5 per cent. more for his money he will not mind losing 1 per cent.; that is assuming that silver is allowed to find its natural level. He would calculate it in this way. He would say there is 800 millions of silver coin in the world (I put that figure as an illustration, merely), we produce eight millions of silver every year more than we require for the present condition of things. The proportion between eight millions, the surplus production, and the 800 millions which is in circulation, is 1 per cent. The capitalist would naturally say we may expect that silver will go down about 1 per cent. per annum while this condition lasts, but that fall of 1 per cent. is not sufficient to prevent money going to India.

7332. You think the subscription of railway capital was easily obtained when the mints were open?—I think so. You see the owner of actual property in India does not either gain or lose by a change in the standard of value. If you have got a jute mill or a tea garden, and the rupee goes down, it means that your jute mill or tea garden is worth so many more rupees than it was before.

7333. And you think that that applies to railways and other productive works?—Undoubtedly it does.

7334. And that as a matter of fact sterling is attracted to silver-using countries?—I think so.

7335. Supposing that wages and taxes were adjusted in the way you were describing (you mentioned that you contemplated that taxes might be gradually raised), do you think in the long run there would be any advantage? Would it not be the case that the taxpayer would be paying in increased taxes the larger amount of rupees that he was getting from higher prices?—When the adjustment takes place I do not think it would affect the position of anybody. The only thing is that in the course of adjustment there is no doubt that capital would be attracted to India.

7336. You think there would be no friction owing to this interference by Government?—I think the interference of Government with the currency is resented far more than any necessary readjustment of taxation. The interference of the Government with the currency is deeply resented as being an absolutely improper exercise of the functions of Government.

7337. Were you not mentioning that the price of wages had shown a tendency to rise?—Yes.

7338. So far as that goes, would there be any indication to the native or to the wage receiver that currency had been interfered with? If he is already getting more, both in wages and prices, would he draw any inference about currency?—I think there is a general feeling on the part of agriculturists in India that they would be doing a great deal better but for the closing of the mints—that profits would be much greater; that is the view of not only the European indigo and tea planter, but the natives all round.

7339. How has high exchange recently borne upon exports; have exports decreased? Take jute and jute manufactures, for instance?—The leading factor, of course, is the season—whether there is rain or something of that kind. I think the internal trade of the country is seriously interfered with, and the internal trade of the country is quite as important a thing to consider as imports and exports. The internal trade has been interfered with very much by the stringency of money.

7340. Have you any figures to prove the interference with the internal trade of the country?—No, I have not provided myself with the figures, because I believed that you had at your disposal figures prepared by others much better able to prepare them than I am.

7341. With regard to the jute exports within the last year, they have not shown any ill effects, have they?—The jute crop last year was by far the largest on record, and no doubt the shipments have been larger than before, but that depends upon a most favourable season. The consumption of jute has also been extending in a marvellous manner. The consumption of jute is about 20 times what it was when I first went out to India. It is an article the use of which is growing marvellously fast.

7342. So far as that goes, would not that show that the recently ruling rates of exchange did not check trade?—But jute is a monopoly; there is practically no other country that produces jute.

7343. So you consider, with regard to other crops as well as jute, there were some circumstances apart from exchange which were of importance?—Undoubtedly there are many factors in the question, and the most important of them is the season.

7344. And capital?—Capital does not so much affect the produce of the soil as it affects industries like tea-planting, indigo-planting, cotton mills, jute mills, and those things.

7345. On the other hand, does not capital bear on the question of the stringency in the money market—discounting bills, and so on?—Very much so.

7346. That bears on exports, does it not, through its relation with the movement of crops?—Yes.

7347. (*Chairman.*) You said that in your judgment the closing of the mint had had an injurious effect on the trade of India?—Yes.

7348. The evidence that we have received, both statistically and otherwise, is directly to the contrary; that neither the internal nor the external trade of India has been injuriously affected by the closing of the mints. Therefore I wish to give you the opportunity, if you wish either now or hereafter to strengthen your opinion?—I have said that it has caused stringency of money; I have said, and I do not think that anyone can dispute it, that stringency of money interferes with all industries, and I am perfectly satisfied that all industries would have been more prosperous, but for the stringency of money. Another reason I have given is with regard to the money-lenders. I say the money-lenders are gaining by this artificial raising of the value of the rupee, and gaining at the expense of the poor who have borrowed from them.

7349. I am content to leave it as you have put it. Then have you any evidence as to the general discontent which you say prevails among the agricultural and other classes in India, with reference to the closing of the mints?—No, except that when I am in my office in Calcutta I hear constant grumblings from all sides about prices falling in consequence of the high exchange.

The witness withdrew.

Mr. Granville Lowther Acworth called and examined.

7350. (*Chairman*). You were formerly chairman of the United Planters' Association of South India?—Yes.

7351. Do you now reside in India or London?—For the moment I am residing in England.

7352. But you will be going back?—I had not intended to go back but I shall now be compelled to go.

7353. How many years' experience have you of India?—21 years next October.

7354. The Planters' Association, I suppose, would represent the planters of tea and coffee?—Yes.

7355. Indigo?—No.

7356. Anything else?—Tea, coffee, and cinchona.

7357. You feel that you are not only competent but authorised to represent that trade?—I am authorised to represent my association.

7358. What in your opinion was the effect of the closure of the mints in 1893 upon the trades that you are specially representing?—Well it stopped extension.

7359. It arrested progress?—Certainly it arrested progress. I know that from my own estates. I am one of the largest raisers of tea-seed in South India. I used to be able to fill my order book a year in advance. At this time last year my order book was completed for 1898. This year I have been trying ever since the beginning of the year to get orders for 1899, and I have not been able to book a single order, not one.

7360. Do you think that that at all arises from any excess of production?—No, I do not.

7361. Then the production of 1897 would be about the same as 1896 and 1895?—No, I am sure it was not.

7362. You mean there has been no extraordinary increase of production?—No, the increase in the production of tea of late years has been gradual, but steady.

7363. Does that apply also to coffee and cinchona?—Coffee and cinchona are on rather a different footing to tea in South India. Cinchona was so largely produced some years ago that it hardly pays now, and long before the closing of the mints there was a great decrease in the exportation of cinchona. Coffee, on the other hand, will only grow in very favourable situations, and I do not suppose that in Southern India you could find a further 2,000 acres suitable for coffee.

7364. That has been a state of things that has existed for some years?—Many years.

7365. You would not connect that with the closing of the mints?—No, though I consider that the coffee planter is hit just as much as the tea planter.

7366. We have heard it stated for many years past that the consumption of coffee in this country is decreasing?—I believe that is so.

7367. That will also have an effect in arresting the progress of the coffee trade?—Hardly, because it increases in other countries.

7368. Have you any other injurious effect excepting the arrest of progress that you can point to?—Yes, your income is considerably curtailed.

7369. But arresting progress is one thing, retrogression is another. Has it diminished production?—When you have a large capital invested in a thing like an estate in India you cannot shift your capital away. It takes you many years to bring an estate into bearing. You have to build large buildings and fill them with expensive machinery. You are compelled to go on. So that for the present there would certainly not be a diminution in production, but I know that expenses are being cut down, and only two mails ago I heard from my agent in Ceylon that in May 150 superintendents were dismissed owing to lack of means to pay their salaries. I will read you the letter if you wish it. It is dated 4th June 1898. Mr. R. W. Cole, my agent, says: "You know, no "doubt, what a terrible panic exists in Ceylon at the "present time owing to bad prices and that cruel "exchange. The coffee smash was nothing to "what the smash impending in the tea trade is "now. The owners of tea properties are panic-"stricken, nearly every place being worked at a loss, "or only just paying its way without any profit. To "men whose capital is locked up in tea, and who are "dependent on their profits therefrom, it means "absolute ruin, as it does also to superintendents and "assistants whom proprietors cannot afford to keep "on. One hundred and fifty were dismissed from "estates in Ceylon in April for no other reason than "that the companies could not afford to retain their "services, and I know of a case of a visiting agent "who after a fortnight's visit to up-country proper-"ties he represented, returned to Colombo at the "expiry of that time after having given a month's "notice to 27 superintendents for the same cause."

7370. Do you think that is attributable in the main to the rise in exchange?—I think, entirely.

7371. Have you any experience of Northern India?—No, none whatever.

7372. Where is the largest quantity of tea grown in India, in the north or in the south?—Do you include Ceylon with South India?

7373. No, I do not?—Then in the north.

7374. You represent the Planters' Association for India; we are to have separate witnesses from Ceylon?—But our interests are so intimately bound up with Ceylon, Ceylon drawing all its labour nearly from us, that it is impossible to separate the two.

7375. So far as India is concerned the larger proportion of tea is grown in the north?—In the north.

7376. I understand that so far as South India is concerned it is a question of tea mainly?—Tea mainly, so far as my evidence is concerned.

7377. Coffee is not really applicable, and you do not represent indigo?—No, it is tea mainly; but at the same time it must not be forgotten that coffee and cinchona are equally affected, and I am supposed to represent those industries.

Mr. G. L. Acworth.

19 July 1898.

7378. Anything that you would like to say about them we shall be pleased to hear, but your evidence would be directed to the tea question mainly?—Yes.

7379. Now, first of all, have the prices of tea fallen?—Do you mean momentarily?

7380. I mean gold prices in London?—Do you mean momentarily or for a series of years?

7381. I mean since the mints were closed?—Yes, I think they have.

7382. I want to know whether prices have been falling or rising?—The mints were closed in 1892–93. The market has fallen about 2¼*d.* per pound since then.

7383. That is the gold price in London?—The gold price in London.

7384. What was your price in London in 1891?—10*d.*

7385. And now what is it?—7*d.*

7386. How would the gold price in London be affected by the closing of the mints?—We have to accept a cheaper price on account of our competition with China.

7387. It is a question of competition?—A question of competition.

7388. If there was no competion it would have no effect whatever?—Yes, it would.

7389. What?—It would have an effect on our purchases of silver. We work on a silver basis in India. We receive gold for our prices, and we have to buy silver, and send it out to India.

7390. I will come to that presently, but I want to proceed step by step. So far as the price of tea in the market in London is concerned, it is, of course, totally irrespective of whether the article comes from India, or from China, or elsewhere. The gold price of tea in London would not be affected by the closing of the mints in India?—No, it would not.

7391. I am not saying that your profits or losses would not be affected, nor am I intending for a moment to imply that your expenses might not increase or decrease, but so far as regards the gold price in London, it is not affected by the closing of the mints?—It is entirely, I should say, a question of supply and demand.

7392. I suppose the price in London represents practically the price in the world generally?—Yes, I should imagine so.

7393. I was going to ask you whether there is any difference in America?—That I could not tell you. If you are going to allow us to bring in the argument of competition with China, then that does come in.

7394. Yes?—There is a difference, because we have to compete with China in America, and we have to accept much lower prices.

7395. You did have to compete with China in England?—We did.

7396. And as tea could be produced more cheaply in India than in China you have beaten them?—We have beaten them. We have produced a better article, and it has hit the taste of the public. The reason is that, in spite of the price, Indian tea is a cheaper article per pound than China tea. You get very nearly double out of a pound of Indian tea, so that it is cheaper to pay 7*d.* for Indian tea than 5*d.* for China tea.

7397. Then the gold price being outside the question altogether, is it to your advantage or disadvantage that the current price which you receive in London should produce more or less rupees in India?—That it should produce more.

7398. Why?—Because we pay our labour in silver.

7399. Do you pay anything else but labour in silver. I suppose whatever machinery you use is exported from England?—Yes. There is nothing more but labour, but that is, I suppose, 90 per cent. of our whole expenditure.

7400. Of your expenditure on production, nine tenths of it would be labour?—Yes.

7401. And, therefore, while you might gain on one-tenth by a fall in exchange you lose on nine-tenths by a rise in exchange?—Yes.

7402. Have your wages been stationary, or have they increased or decreased?—You might almost say that they have been stationary. They have increased very slightly.

7403. Now will you explain to the Committee what you alluded to just now as the bullion competition with China, and the effect upon the tea trade of that—first in our market, and then in the American market?—I can put it to you here in figures. We will say that "A" ships from India 100,000 lbs. of tea, and receives in London 7*d.* per lb.; he remits the proceeds to India at 1*s.* 4*d.* the rupee. He receives for that 43,750 rupees.

7404. In India at 1*s.* 4*d.*?—In India at 1*s.* 4*d.* "B" ships from China 100,000 lbs. of tea at 7*d.* per lb. He remits the proceeds to China at 1*s.* 11⅛*d.* per dollar, which is the present price of exchange on China, for which he receives 30,270 dollars. 30,270 dollars are equivalent to 60,540 rupees. Therefore China has the advantage over India in every 100,000 lbs. of tea of 16,790 rupees; or, to put it in other words, in every pound of tea she receives a bonus of one anna eight pies per lb.

7405. Now, are wages the same in China as they are in India?—That I cannot tell you.

7406. Do you think the cost of production is more or less in China than in India?—I should imagine much less in China; of course I have no real knowledge.

7407. But your opinion would be that it would bo less, and I suppose that would be the opinion ef most people?—Yes, but I would draw your attention to this. China has an advantage of one anna eight pies per lb. He is a very very fortunate planter in India, who makes a profit of 1 anna 8 pies per lb. on his tea.

7408. That being the effect of what we call the bullion competition, will you tell us how it has affected the imports from China and India into America?—I have not the figures for that, but I can get them.

7409. Then will you put them into your evidence when you correct your proof?—If they are to be had in the City I will get them. I may say that, if our exports to America are increasing, they are probably increasing through our own action there. I mean to say, we tea planters, have for many years past taxed ourselves voluntarily, and kept a representative in America to push our produce. We had no field in America before we took that action. I do not suppose there was 100,000 lbs. of Indian tea drunk throughout America, and last year we had increased our exports to 10 million lbs. But it was entirely by our own exertions, because at the first many of the large dealers in America absolutely refused to store our tea in their warehouses.

7410 I suppose your increased sales in America sprang from the same causes as did your successes in competition with China in this country—that you gave a better article?—But we had to give it away at first. When you take our increased exports into America it must be remembered that that is done by our own efforts, and that it is not likely that we shall be able to go on doing it.

7411. Why not? You have an enormous market there in America?—Yes, but we shall soon be making no profit, and cannot afford to tax ourselves.

7412. (*Sir F. Mowatt.*) That does not mean that you are making no profit now?—We are making a bare profit.

7413. You are not continuing to give it away?—No.

7414. (*Chairman.*) Do you pay your wages in money or in kind?—In money.

7415. Altogether?—Altogether.

7416. The mints now being closed, what do you think is the best course to take? Are you in favour of reopening the mints?—Of course I am not a

currency expert, and I do not pretend to know what the effect of reopening the mints would be, but I certainly think it would be for the benefit of the empire to reopen the mints. It should never be forgotton that the Indian Empire is a producing empire, and that it is not merely the Government remittances that have to be considered, but the 250,000,000 labourers behind them.

7417. I think you have already said that "India is "essentially a producing and exporting country, and "it is by her exports that she must live and thrive. "Tea, coffee, cotton, jute, cinchona, wheat, pepper, "hides, and seeds are some of her most important "products, and all these come into competition with "such countries as China, Japan, Brazil, and the "Central States of America, where the standard is "either a silver one, or practically a silver one, as in "the case of Japan and Brazil?"—Yes.

7418. Japan is on a gold system?—Yes, but it is fixed at a very low ratio, and it is a question whether Japan will be able to keep her gold—in fact it was told me in the City the other day that the Japanese have petitioned their Government for a bounty on the exports, owing to the introduction of gold.

7419. Do you think that the decline in the value of the rupee has fallen heavily on the consumers of imported goods?—No, I do not.

7420. Why?—Because almost all imported goods are now produced a great deal more cheaply than they were 20 years ago. They have really been produced in a cheaper ratio than the fall of the rupee has been.

7421. Is that so to-day, in 1897-98?—I think so. I think, if you will turn to the Review of the Trade of India for 1896-97, and look at the range of prices in 1875 and 1892, when the rupee was at its lowest point, you will see that to be so. Take grey shirtings, for instance. Taking the numeral 100 as representing the value of grey shirtings, in March 1875 it was 86; in March 1892 it was 74. Then mule twist, in March 1875, was 92, and in 1892 it was 64. Turkey red twist, in March 1875, was 102, and in March 1892 it was 57. Iron, in March 1875, was 93, and in March 1892 it was 64.

7422. Now assuming that imports are cheaper, would they not be still cheaper if exchange did not apply?—I do not think so. If you will turn to the same table you will find that, for instance, iron in March 1892 was 64, and in July 1897 it was 114.

7423. Per ton?—I conclude it is per ton.

7424. What description of iron?—"Iron—flat, bolt," &c.

7425. There has been a fall in the price of steel rails?—Yes. Copper sheeting was 72 in 1892, and in 1897 it was 93. Then turkey red, in March 1892, was 57, and in July 1897, with a higher exchange, it was 62.

7426. You do not think that the actual amount of wages has varied much?—No, they have a little, but not much.

7427. Has the purchasing power of the rupee varied?—No; not for such goods as our coolies use. It depends entirely on seasons. If there has been a good season, such articles as they consume are cheap. If it is a bad season they are dear.

7428. Assuming there has been no rise in wages, which represent $\frac{9}{10}$ths of the cost of your production, the larger number of rupees that you receive in exchange for your gold price is so much additional profit?—So much additional profit, or perhaps to put it in another way, it saves us from any loss.

7429. Have you at all considered what would be the effect on the finances of India of open mints and a fall in exchange?—I have considered it of course from the point of view of what I may call an outsider. As I say, I do not profess to be an expert in the currency question.

7430. This is not a currency question: it is an administrative question?—I suppose the rupee would fall, and that perhaps, temporarily, it might create a certain amount of difficulty, but it would only be temporary, and I believe the Government of India is very well able to meet its obligations. It always has done so, and the other day, Lord George Hamilton stated in the House that no country except the United Kingdom could show such a record in its finances for the past 20 years.

7431. That is not with the rupee at 10*d.*?—But it had gone to 1*s.* 1*d.* in that time.

7432. May I take it that in your judgment the tea producers in South India, where you have personal knowledge, and certainly in Ceylon, where you say the considerations are the same, would be handicapped in competing with silver countries by keeping the exchange at 1*s.* 4*d.*?—Undoubtedly.

7433. And the other effect also upon your trade would be that it would practically amount to such an additional burden in the cost of your production that it would deprive you of any gain?—I think so certainly.

7434. Is there anything else that you wish to say in addition to that?—I do not think I have anything more to say on that subject, but I should like if I may, as I have been asked to represent that industry, to turn to the subject of the gold production in Mysore.

7435. That is increasing rapidly, is it not?—It is rapidly increasing, but it is also very heavily taxed.

7436. The gold is?—Yes, by the artificial rate of the rupee. Gold is almost as good an instance as one can take. The price of gold may be reckoned as 3*l.* 17*s.* 6*d.* the ounce, and that price is steady: it has not varied, I think, ever since England introduced a gold standard.

7437. In Mysore?—Mysore has followed the price all over the world. Sir John Taylor and Sons, who are the head practically of the gold mine industry in Mysore, write to Mr. Hodgson, who passed the letter on to me, "The expenditure at the Kolar Mines affected "by exchange amounts to about Rs. 633,000 per "month, or Rs. 7,596,000 per annum, therefore, every "penny that is added to the price of the rupee "increases the expenditure by 2,637*l.* 10*s.* per month, "or 31,650*l.* per annum."

7438. During the greater portion of the period that the Mysore mines have been open has not the exchange been much higher than 1*s.* 4*d.*?—Before the closing of the mints it did not affect them, because they were working on an equal level with other countries. They were all on a par.

7439. Are they not paying higher dividends this year?—That may be due to more production.

7440. But that tempers the east wind to the shorn lamb?—It may temper the east wind to the shorn lamb, but still they have this loss of 250,000*l.* If they had their mines anywhere else they would be 250,000*l.* a year richer than they are now.

7441. Is there any other remark that you would like to make?—I think not.

7442. (*Mr. Campbell.*) You think the rupee was fixed too high at 1*s.* 4*d.*?—I think it was a mistake to fix it at all.

7443. You think it is too high at 1*s.* 4*d.*, would you think it too high at 1*s.* 3*d.* or 1*s.* 2*d.*?—I think it a mistake to fix it in any way.

7444. That is to say you would not have a gold standard at all?—I would not have a gold standard. I think it is unsuitable for India.

7445. If you have a gold standard you must fix it?—Yes.

7446. The tea industry was very prosperous some years ago when exchange was in the neighbourhood of 1*s.* 2*d.*?—Yes, before the closing of the mints.

7447. Before the closing of the mints exchange never fell to 1*s.* 2*d.* I am speaking of 1894-95?—Yes that is so.

7448. The tea industry was a very prosperous one then, was it not?—Yes, it was.

7449. And if exchange instead of being fixed at 1*s.* 4*d.* had kept at about that neighbourhood, is there reason to suppose that it would not have been as prosperous now?—I think it would not be prosperous.

Mr. G. L. Acworth.

19 July 1898.

7450. For what reason?—I think if you are going to fix it at 1*s.* 2*d.* when its true value is 10*d.* you still handicap the Indian producer in his competition with other countries. Of course it takes time to feel the effects of a measure like the closing of the mints. In 1894–95 we had not begun to feel it, it is only recently that we have done so.

7451. You would object to anything but the silver value of the rupee?—I should object to anything but that.

7452. The production of tea has been increasing a good deal during late years has it not?—It depends on what you call during late years. If you take the last three years the output has not been increasing much.

7453. And consumption, I think, has increased?—No, consumption I think is pretty nearly steady now—there is not much more room in the United Kingdom.

7454. So that you do not hope for any increase in prices owing to the increased consumption?—I do not think there is any chance of that. Of course in a bad season there may be a temporary falling off in crops which may conduce to a slightly higher rate, but I do not think there is any chance of a permanent rise.

7455. Not even if the curtailed production which you spoke of is continued?—I do not think so.

7456. You say you have driven Chinese tea partly out of the English market?—Yes.

7457. But you have not done that in America?—We have hardly displaced it at all.

7458. And in Australia?—In Australia we have practically driven China out of the market, but we did that long ago.

7459. Do you know if China is making any effort to regain her hold of the English market?—Well, that she is making efforts to regain her hold on the English market I cannot say, but I know that China is making every possible effort to improve her tea, and I presume that that means she will push it into the English market when she has improved it.

7460. You mean by improved cultivation ——?—Improved cultivation and improved manufacture.

7461. Have you seen any indication of European enterprise being associated with it?—Only from what I have heard. There is the Foochow Tea Improvement Company, whose prospectus you could no doubt get in the city, which has been started for the purpose of improving the cultivation and manufacture of China tea, and that is a body of British merchants.

7462. If that were introduced on any large scale, and tea production on the lines followed in India and Ceylon were introduced into China, China would become a formidable competitor?—Yes, I think she could rush us out of our market.

7463. Especially with the handicap of exchange?—I mean with the handicap of exchange.

7464. Labour is very cheap in China?—Yes. I said just now to Sir Henry Fowler that I had had no experience, but I do know as a fact that labour is cheaper in China than in India.

7465. (*Chairman.*) Just to get this figure right, the export of tea both from China and Ceylon and from India is rapidly increasing; it increased last year?—The figures for India last year were 148,258,000 lbs. against 148,217,000 lbs. That is a difference of 35,000 lbs.

7466. In the returns that we have it is put at 153,000,000 last year from India?—I got this from a large broker in the city. Every circular that is issued by one of the largest firms of tea-brokers in the city, Messrs. Gow, Wilson, and Staunton, points to the fact that there is not room for more tea in England. I got that from Messrs. Gow, Wilson, and Staunton.

7467. The better test after all is the revenue, there is no doubt about that. Now in 1895 the revenue from tea was 3,587,000*l.* In 1896 it was 3,746,000*l.*, in 1897, 3,799,372*l.* Last year there was an increase again?—Yes.

7468. You say there is no room for expansion of the trade?—I do not think there is any room for the expansion of the trade compared to the expansion, say, from 1888 to 1892.

7469. I just wanted to call your attention to the fact that there is an enormously rapid increase of the duty received at the rate of 4*d.* in the lb.?—No doubt you are right, but this has been done at a great sacrifice to the producer, who cannot afford a further fall.

7470. (*Mr. Le Marchant.*) You were speaking of expansion in the years 1888 to 1892. That would have some effect on the market, that is to say, your supplies have been materially increased?—They have been, but up to quite recently they were being increased with the object of driving China tea out.

7471. And succeeded?—And succeeded, but at a great sacrifice of price.

7472. That takes place in other industries?—Undoubtedly.

7473. It is a form of competition?—Undoubtedly

7474. There has been an increase of cultivation in Ceylon?—Yes, and in India.

7445. But not to the same extent in India?—Hardly to the same extent in India, I imagine, the reason being that Ceylon had to make up her leeway. She was interested in coffee and cinchona, and owing to the disease in the coffee they had to get rid of it and to find something to take its place. They had their capital in the soil. They could not remove it from the island, and they had to replace coffee, which they did by planting tea.

7476. And with a good deal of profit in some years?—Undoubtedly, nobody works without.

7477. Now, with regard to wages in South India, have they been increasing in recent years?—Very, very slightly so. There has been a slight increase of wages since I first went to India—a very slight increase.

7478. You were alluding to the prices of the articles the ryot had to buy. I will exclude the famine year, because that was exceptional, but, taking the period before and after that time, would you say that prices have remained the same?—I should say so on the average.

7479. You would not say that there was a general drift upwards?—No, I think not.

7480. You were speaking just now of the gold mines of Mysore as being placed at a disadvantage by the rise of Exchange. Does that apply to anything besides wages? Does that apply to machinery?—No, it would not apply to machinery.

7481. Merely to wages and cost of labour?—Merely to wages and cost of labour.

7482. Is mining labour a special class by itself, or does its rate of wages vary with that ruling in other employments?—They pay rather higher, I think, in the gold mines than elsewhere. The work is underground and is not popular.

7483. So that there is an element either of disagreeable work or greater skill in it which involves an extra price?—Yes, and I think you will find it is the case with all underground labour all over the world, that it is rather higher paid than is the labour of the soil.

7484. And that rate of payment may probably have tended to rise more in Mysore than in the tea provinces?—I cannot tell you that, but I should imagine that they are paying much the same prices now as at first, perhaps a little less. At first they would have to pay higher prices to get the men to go underground at all, but as the people got accustomed to going underground they would have been able to decrease their scale.

7485. Would the wages be higher now than when they were first developing that field?—I do not suppose it is higher, but some few years ago they were working on a level with other silver-using countries. Since the closing of the mints they have been working at a disadvantage.

7486. Would you say that the majority of the gold mines are in silver-using countries?—I do not know that there is much in Peru. Mexico is a silver-using country.

7487. But would you not say that the Cape and Australia and America were three of the chief gold-producing countries?—It may be so, but I do not think that will alter the fact that the Indian gold mines are paying more than they ought to pay, using the artificial rupee. Why should they be taxed at that amount? It is a direct tax on their produce.

7488. But are Indian gold mines at a special disadvantage as compared with other gold mines?—Competition of course really does not much matter, because it is a commodity, the price of which never really varies. You may say that that can always be produced at a profit so far as we have seen at present, but that does not alter the fact that the Indian gold mines are being fined 250,000*l.* a year.

7489. As compared with what the cost of labour would be if India were on a silver basis?—Yes.

7490. Assuming that nothing else varied?—I am speaking of silver at 26*d.* an ounce.

7491. And that wages did not rise?—Yes, and there is no reason to suppose they would.

7492. (*Chairman.*) Your argument does not apply to countries which are not silver-using countries?—No. I bring forward gold as a case, because what happens in gold happens in every other product in India, and when you show that on a small field like the Mysore field there is a tax of 250,000*l.*, what must be the tax on the whole productions of India, because the argument as applied to gold applies to every other product in the country, that you are paying a higher value for your labour than you need by paying it in gold?

7493. (*Mr. Le Marchant.*) And that rate of wages, you think, would be the same, whatever the system of currency might be?—I am sure of it. I am quite sure that a low exchange would not alter the rate of labour.

7494. Nor prices?—I imagine not. I have seen the rupee fall from 1*s.* 10*d.* to 1*s.* 1*d.*, and I never found any material alterations in prices.

7495. But they are subject to variations?—They are subject to good or bad seasons.

7496. So that you feel confident that prices would not adjust themselves to a different level of exchange?—I am speaking of the prices that the coolie pays. I do not think that they would alter.

7497. (*Chairman.*) I can just give the exact figures of tea in the United Kingdom retained for home consumption. In 1891, 202,000,000 lbs. In 1892, 207,000,000 lbs. In 1893, 208,000,000 lbs. In 1894, 214,000,000 lbs. In 1895, 221,000,000 lbs. In 1896, 227¾ million lbs.

7498. (*Mr. Holland.*) The tea planter and the grower of produce claim to have themselves the advantage of this 10*d.* rupee. Is not that so?—They want to have the advantage of it.

7499. And you have spoken of it several times as being the true value of the rupee?—No, I will not say that, because the value of the rupee varies. I believe silver is 27*d.* an ounce now. I imagine that would make the rupee worth about 10½*d.*

7500. But within those limits, do you not admit that so far from being the true value it is an artificially low value?—No, I do not admit that.

7501. If the mints had not been closed, for instance, do you think the value would have been so low?—You have to take other factors into consideration. For instance, there has been lately a demand by Spain for silver which has sent silver up a penny or three-halfpence; but if the mints had not been closed, I do not think we should ever have seen the rupee so low as it did go to.

7502. The ground of your discontent is not so much that you cannot yourselves have the advantage of a low rate, but that your competitors in silver-using countries have that advantage?—Yes.

7503. And therefore your competition with them is unfair?—Exactly.

7504. (*Sir A. Dent.*) Is there much tea grown in South India as compared with North India?—As compared with North India, the tea industry in South India is very small.

7505. Is it 25 per cent. of the tea industry of India?—I should imagine it is not.

7506. Is it 10 per cent.?—I could not tell you without reference to the figures, but I should imagine that of the cultivation of South India, taking tea and coffee together, probably tea is about a quarter of coffee, and, as estimated by the South India Planters Inquiry Committee, the value of the estates in South India is 13,000,000*l.*; that is coffee and tea. So that, probably, the tea might be about a quarter of that. In Travancore, which is a very considerable province in South India, you may say that the whole cultivation is tea, and all through the Nilgiris.

7507. From what ports is that shipped?—Cochin, Quilon, and Calicut.

7508. You say there are probably under 2,000 acres left in South India for the cultivation of coffee. That would apply to tea, would it not?—No, there is more available for tea than coffee. Perhaps I am not quite right in saying that there are not more than 2,000 acres available for coffee. I ought to have qualified that by saying that there are other places that are not now available, but could be made available; I mean there are no roads or railways.

7509. As tea in South India is a comparatively small industry, I suppose you are speaking as much for Ceylon as for South India?—I should really speak, too, for North India as regards that, because our interests are identical. I speak for the whole body of tea producers.

7510. But the planters of South India have rather amalgamated with the planters of Ceylon in presenting themselves before this Committee?—Yes.

7511. You told us that 127 superintendents had been dismissed recently, and that there was practically a panic in Ceylon?—Yes.

7512. Personally, I was rather surprised to hear that, because I hear a good deal about Ceylon. May I ask if that is mere general public opinion, or is it more a private note?—It was a letter to me from my agent. I employ an agent, who is an old Ceylon planter, to get me orders for my tea seed, and it was he who gave me the information. He has been in Ceylon, I suppose, some 15 years, and I have no reason to suppose that his statement is not an accurate one.

7513. When you say 127 superintendents were dismissed, it might be thought from that that 127 estates had been abandoned?—Not in the least.

7514. Possibly it is only 127 assistants?—No, I do know that it is even that. I remember in the old coffee days, when coffee was dying out right and left in South India, the first means of reducing the expenditure was to dismiss the superintendents, and the result was that five or six estates would be put under one management. I, myself, at one time had seven estates. All seven were under my management, without any other European supervision whatever.

7515. The prospects of Ceylon, of course, have not improved in the last few years, but they have not come to abandoning their estates yet?—Yes, I believe they have.

7516. You do not know that yourself?—No.

7517. I suppose the planters of South India and Ceylon, with reference to China, are more afraid of what China is going to do than of what China has actually done, is not that so?—Partially. China has done a good deal already. She has already compelled us to accept a price that we never anticipated that we should have to accept.

7518. I think that is an arguable point. Then you also refer to the Foochow Tea Improvement Company. Do you know anything of its working?—I know nothing of their working, but it would be easy to get hold of their prospectus in the city.

7519. Have they got much beyond the prospectus stage?—I understand that machinery has been ordered and sent out to China. I know that.

Mr. G. L. Acworth.

19 July 1898.

7520. Then, you alluded to the handicap of the 1*s.* 4*d.* exchange, as against the intrinsic value of silver. May I ask if you have ever studied the question of the copper cash in China?—No, I know nothing of that.

7521. There is a great handicap there. I have heard it said that a few years ago you could get 1,200 copper cash for the dollar, but owing to the depreciation in silver you now get only 800?—I know nothing of China.

7522. (*Sir C. Crosthwaite.*) I understand you to say that in your experience wages have been practically stationary in South India?—Not absolutely, but practically stationary. We pay slightly higher rates than we did.

7523. And you say, also, that the purchasing power of the rupee, as regards the articles consumed generally by the labourers, had remained about the same?—About the same.

7524. That would mean, would it not, that the prices of food grains had remained about the same?—Not necessarily, because you remember that the estates in South India are rather inaccessible, and it does not pay to send the food grains out of the country. In my own district for instance, the foot of the hills, from which I come, is 90 miles from a railway, and the railway is some 150 miles from the seaport, so that the cost of transmission of the grain to the seaport is enormous, and they prefer to sell it in the country to shipping it. That is the reason, I imagine, that the food grains have remained stationary; that applies generally to the whole planting district of South India.

7525. That evidence merely applies to a certain tract?—It applies to the whole of the southern Indian planting districts.

7526. What do your coolies mostly live on?—They live on ragi, cholum, rice, curry stuffs, cocoa-nuts, and so on.

7527. Is rice exported from that part of South India to Ceylon?—I do not think so. I could not say so with certainty; they may export a certain amount of rice from Tuticorin; I rather doubt it.

7528. Has not the price of rice risen?—Only according to the season. Rice was very high last year.

7529. Over 20 years, has there not been a great rise?—Not a great rise. Understand, I am speaking of South India, our planting district.

7530. I understood you also to say that there has been no alteration of Indian prices owing to the variations of exchange?—The prices of our produce, do you mean?

7531. Yes, the prices in India of produce?—Our produce in South India is not sold in India. We send it all to England. I do not think I could have made that statement.

7532. You did not make it with regard to produce in India generally?—With regard to tea, certainly not. There has been a great fall.

7533. (*Sir D. Barbour.*) I think you said that the value of the tea and cinchona and coffee estates in South India was about 13 millions sterling?—Yes.

7534. Do you know how they were valued?—By the South India Planters' Inquiry Committee—a Committee appointed by the Viceroy to inquire into the grievances of the planters of South India.

7535. What year was that?—It was in 1896, I think. They took infinite pains with that inquiry.

7536. Was that the market value at the time, or the cost of creating these estates?—I conclude it was the market value at the time.

7537. You are not certain of that?—Well, the method in which they arrived at their valuation was to send round a series of questions to every planter in South India, requesting him to state the value of his property, and the wages he paid. and the per-centage he made on his capital, and so on, and return the questions with the answers to the Committee, and then they formed their own opinion on the subject.

7538. Every man values his own property?—I think so—yes.

7539. So that we may assume that he did not put it too low; that would not be his interest?—Well, I should imagine his interest was to tell the truth, as every gentleman's is.

7540. I do not accuse anyone of intentionally overvaluing his estate, but there is no reason to think that the value was put too low?—I should think in many instances it was put too low. I should imagine decidedly so, but I should imagine what was really done—I certainly did it in my own case—was to put the true value, and I know I could have put it at a higher price.

7541. You put it at its market value?—I put it at what I considered its market value.

7542. Is your own personal industry the production of tea, or tea seed, or both?—Both.

7543. You said you thought the fall in exchange had not kept the rupee price higher for the person who used imported goods. Do you think that that can possibly be the case?—I think so, and I think you will find the figures I have given in my statement are correct.

7544. I am not challenging those figures, but would not the rupee prices have been higher if the exchange had been lower? Must it not necessarily be so?—It depends what you mean. If you mean that rupee prices would be higher now than they would be 15 or 20 years ago, I should be inclined to dispute it.

7545. I do not mean that?—If you mean that the prices would be, say, lower in 1897–98 than they were in 1890–91, I should be prepared to accept it.

7546. I do not mean that either. I mean that if the rupee price of an imported article is 100, with the exchange at 1*s.* 4*d.*, it must have been something more if the exchange was 1*s.*?—Quite so, but I think it requires some qualification, because the argument so far, by the Government of India, has been that the importer now has to pay a far higher price than he had when exchange was high. That is not the case.

7547. I do not think the Government of India have said that?—Yes, I have it here in black and white. "A country as a whole makes no gain in its "international trade by a depreciation of its standard, "the higher prices received for exports being "balanced by those of imports." That is what the Government of India stated, but higher prices, owing to the fall of exchange, have not been balanced in that way, because in 1875 exchange was high, and yet the price of goods in 1892 was considerably lower than in 1875, so that the argument does not hold good.

7548. But the Government of India were dealing simply with the question of exchange. If the exchange is low the exporter gets a higher price, but the importer has equally to pay a higher price?—That is a *sine quâ non*, of course, but you must remember that the import trade in India is insignificant comparatively with the export trade.

7549. I do not know that it is comparatively insignificant, but the question is this, that if exchange is low the importer must pay a higher price than he would have done if the exchange were high?—Of course he would.

7550. You said you thought silver was a better standard than gold?—Undoubtedly.

7551. Why is it better?—Because the goods of India compete with those of other silver-using countries, and if you are going to have a fixed standard in gold you immediately handicap the Indian producer.

7552. If the other country issued inconvertible paper, like Argentina, and caused a fall in the exchange, how would you meet that competition?—I am not a currency expert, and I cannot answer questions of that class. I only know that provided there is a fixed currency in India, and we have to compete with China and the Straits and other countries with the ordinary standard, we are handicapped tremendously.

7553. Do you think it is a permanent handicap?—Undoubtedly.

7554. Why would it be so?—I think if India has a gold standard she will import very much less silver, and so much more will go on the market that prices will run down, which will give a bonus to other silver-using countries.

7555. Do you not think that wages as well as prices will rise in those silver-using countries?—No, I do not think there is any reason to suppose so.

7556. (*Sir J. Muir.*) I think you mentioned that you considered that you had retired from India for good?—I had not intended going back.

7557. But now you feel that you will be compelled to return to India?—I know I shall.

7558. Why?—Because I cannot live in England.

7559. Why?—Because my income has been so reduced that I cannot afford to live here.

7560. Reduced by what?—By the depreciation of the rupee, by this tampering with the exchange.

7561. Then you feel, as it were, that you have a grievance against the Government of India?—I think I have a most decided grievance, which is shared by all producers.

7562. It is shared by the planters of Southern India?—I know it is shared by all planters, and I am quite certain that if it were understood by the natives, it would be shared by the natives. Unfortunately in India this sort of information very slowly percolates to the small producer, and he does not understand the mischief that is being done him. As soon as he gets to understand it, I imagine it will be a serious matter.

7563. Can you tell us about how much capital has been invested in tea in South India?—I should think about 3,000,000*l.* sterling.

7564. You have referred in strong terms to the effect that this policy of the Government in closing the mints, and fixing the rupee at 1s. 4*d.*, will have on you personally. Now, are you anxious lest your estates in South India should become unremunerative?—That is what I fear.

7565. Not merely that they may not give you any income on which to live—— ?—What I fear is that I shall have to put into my estates, in order to keep them going at all, the income that I have outside my estates altogether. I fear that my income will be less than my expenditure on the estate.

7566. Then, with regard to the other planters who have solely their estates to depend upon, who perhaps may be financed by houses in Madras, or it may be in London, what will be the effect upon them?—The estates will be taken over eventually, I imagine, by the firms who financed them. That happened before in the case of the coffee disaster in Ceylon; the estates which got involved to the coast firms were taken over by the coast firms, and there was widespread ruin among the planters.

7567. We had a very leading banker before us recently who spoke of this action of the Government of India as being, in his opinion, arbitrary and despotic—do you share his views?—I not only share his views, but it seems to me as absurd for the Government to try to artificially fix the value of the rupee, as it was for James II. to melt down brass cannon and coin them, and call them shillings. You will not get the outside world to accept your artificial standard. You appreciate the coin beyond its full value, but the world will not accept it, it can only circulate in the country; it would probably cause a revolution in any other country but India that understood it.

7568. You mentioned, in addition to tea proper, that you were a producer to a considerable extent of tea seed?—Yes, I am.

7569. And that you had found it impossible to sell any of your seed for next season?—Yes.

7570. You talk of that as an indication that the planters of South India have got frightened at the prospects of their business being seriously imperilled?—I think that is the reason entirely. I know of no reason for it otherwise. I have been able to sell before, I cannot sell now.

7571. Do you sell it entirely in Southern India or in Ceylon partly?—Entirely in South India.

7572. Your estates are in Travancore?—Yes.

7573. The planters of South India seem to feel that they have a strong grievance against the Government of India in consequence of this arbitrary proceeding. Have they suggested any means whereby they might get relief from this injury that they are sustaining?—The planters of South India are perfectly willing, should the Government of India find it necessary to make good the deficit, to submit to an export duty on their produce in order to make good any deficit there may be. But in saying that, of course they assume that it would be put on the produce of India in general; I mean on all produce, wheat, jute, hides, and everything.

7574. Have you considered the question as to an increased tax on imports?—I do not think that you could do it by increasing the tax on the imports. There is already a 5 per cent. import duty, and it seems to me only fair that if revenue is required, it should now be raised from the exports.

7575. (*Chairman.*) Who pays the duty that is put on the exports?—We do not pay any now.

7576. But suppose a duty were put on exports, who would pay it?—I suppose the producer.

7577. Do you think so? Suppose Government put a duty of 2*d.* in the pound on tea exported, who would pay that extra 2*d.*?—I suppose as it was sent from the port of shipment——

7578. I do not mean to say who would find the coin, but who would be the ultimate payer? Would not that increase the price of the tea in the London market?—I do not think it would, because you have got China as a factor.

7579. But you must pay it on all exports?—I mean Indian exports.

7580. You propose that the London consumer shall be liable to have the price of his tea imported from the British Empire raised so that he will have to pay a higher price for it than if tea were imported from China?—I do not think he would have to pay a higher price for it myself. Because I think if we had a very small tax, say 3 per cent. on tea, our price in London now would be sufficient to cover it.

7581. Do you mean that you have such a large margin that you could afford a duty of 2*d.*?—I did not say 2*d.*, I said 3 per cent.

7582. But the principle is the same?—Hardly, because at present we are paying a duty of 40 per cent.

7583. (*Sir J. Muir.*) In reply to the Chairman you are making a comparison; that is to say, you and the planters of southern India consider that you are practically loaded just now by a heavy duty in respect of this 1*s.* 4*d.* exchange, and that suppose a 3 per cent. duty were put upon you to meet the Government budget—— ?—It would be infinitely preferable to paying the disguised duty that we now pay.

7584. (*Sir F. Mowatt.*) You said that the effect of the change from a silver standard to a gold standard in India was so severe, that if it had been applied to any other country it might have caused a revolution?—I did not say that, I think. I said that the artificial raising of the rupee, I believe, in any country that had the intelligence to understand what effect it would have would have caused a revolution. I believe that such a measure of legislation would have been absolutely impossible in this country, granting that this country had a silver currency. I do not believe it would have been possible to have done such a thing.

7585. But there has been a change from a silver standard to a gold standard in Germany, has there not?—Yes; but I was speaking of the artificial appreciation of the currency, not of the introduction of a new standard. I said the artificial appreciation of the currency, supposing you have a rupee at 2*s.* and you arbitrarily call it 2*s.* 6*d.*, I say that would cause a revolution. I say that the introduction of a gold piece to represent 2*s.* would cause a revolution.

Mr. G. L. Acworth.

19 July 1898.

7586. (*Chairman.*) You object to a gold standard for India, because it would put India into such a disadvantageous position in competition with silver-using countries?—Yes.

7587. Are you aware that 80 per cent. of the trade in India is done with gold-using countries?—Yes, I am.

7588. How would that affect your opinion?—Whether you introduce gold or not, our wages must be paid in silver. As I understand it, this gold is not to circulate, it is to be hoarded.

7589. That is not the point; that is a detail of one scheme. I understood you to say that you objected to a gold standard for India altogether, no matter how worked out, because it would put India at a disadvantage with silver-using countries?—Yes, because we compete with silver-using countries.

7590. And you compete with gold-using countries?—No, we do not compete with gold-using countries, we compete with silver-using countries. Our goods are almost all sent to Europe.

7591. To gold-using countries?—To gold-using countries, and are sold in gold using countries; but we compete with China and the Argentine.

7592. But you compete with China so far as tea is concerned in London?—No, we compete with China so far as tea is concerned in China.

7593. But you send your tea to London and they send their tea to London, and you beat them because you have a better article which you sell at a lower price?—But the China producer can buy more silver than I can; therefore he has an advantage. I compete with him in his own currency.

7594. You say you are not a currency expert, and you need not answer this unless you like; do you not think that the standard of value and the medium of circulation should be liable to as few fluctuations as possible?—Yes.

7595. Then putting the Government out of the question, let us take the enormous fluctuations in the price of silver?—I quite admit all that, but there have been many factors to make silver fluctuate. If the Government of India would adopt the policy suggested, if they would reopen the mints, undoubtedly silver would fluctuate at first, but I believe the rupee would gradually steady down, and keep its relative value with silver.

7596. Is not the price of silver affected by the cost of its production, and the increase or decrease of its supply?—Yes, but there is no reason to suppose that its fluctuations would be any more violent than those of any other product. The mistake that has been made is looking on silver as silver. If you would only look upon it as a marketable product just as tea or jute, or any other product, there is no reason why it it should fluctuate more violently than any other product.

7597. You say that an artificial coinage would be of no value outside India?—No.

7598. I agree, but how do you apply that to the artificial coinage that we have in this country?—How do you mean, artificial coinage in this country?

7599. What is the intrinsic value of our shilling?—It is not the coinage of the country—it is not the standard.

7600. I know. We have a gold standard, but we have a token currency?—You have a token currency, and by law you cannot pass more than a certain quantity of it—forty shillings. A shilling is not worth the twentieth part of a sovereign.

7601. Does it not circulate as the twentieth part of a sovereign?—Only by law.

7602. No, there is no law which enables you to get gold for silver?—There is a law which prevents your tendering more silver than the receiver likes to have, which practically amounts to the same thing.

7603. Practically the shilling does circulate here, although it is a token coin?—It circulates as a cowrie does in India. You find in India the cowrie used as a medium of circulation, but it has no value.

7604. My point is that all token currencies partake of that element?—Yes.

7605. Now you said that there was a loss to the native by a high exchange?—By an artificially high exchange.

7606. Where does that come in?—He receives less for his produce.

7607. Would not that mean lower prices?—Where?

7608. If he has to sell?—He gets less if he has to sell.

7609. But you said prices had not changed?—No, I beg your pardon; I qualified that statement by saying that the prices that our labourers pay have not changed. The produce they use for subsistence cannot be sent out of the county owing to the enormous cost of transport; they have no means of sending it. It is a curious fact that in our hills the prices of grain have kept steady; but if you take rice that is sent down to the coast the price has risen enormously.

The witness withdrew.

Adjourned.

(*For Mr. J. E. O'Conor's evidence on this day, see supra p.* 51.)

SEVENTEENTH DAY.

Monday July 25th, 1898.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., (in the Chair).

THE LORD BALFOUR OF BURLEIGH.
SIR JOHN MUIR, Bart.
SIR FRANCIS MOWATT, K.C.B.
SIR DAVID BARBOUR, K.C.M.G.
SIR CHARLES CROSTHWAITE, K.C.S.I.
SIR ALFRED DENT, K.C.M.G.
MR. ROBERT CAMPBELL.
MR. EVERARD HAMBRO.
MR. W. H. HOLLAND.
MR. F. C. LE MARCHANT.

MR. ROBERT CHALMERS, *Secretary*.

The LORD ROTHSCHILD called and examined.

Right Hon. Lord Rothschild.

25 July 1898.

7610. (*Chairman.*) I understand you have a statement you wish to read to us?—I may say at the outset that I know nothing of India itself, never having been there; therefore, in reading this paper, and in giving my opinions, I only give them as an Englishman, and knowing the circumstances in other countries. In this paper I have replied to the questions that were sent to me. I had better say at once that I did approve of the closing of the mints to the free coinage of silver in 1893. Owing to the cessation of purchases of silver by the United States Government, and the failure of the Brussels Conference to come to any conclusion, the Indian Government were face to face with a grave financial crisis, and in view of the impossibility, or supposed impossibility, of increased or new taxation on any large scale, there was no other course at the time open to the Indian Government except the closing of the mints, notwithstanding the fact that the great fall in silver might be of benefit to other silver-consuming countries. I certainly think that there were faults of detail in the operation; the first fault was coupling the closing of the mints with the subsequent introduction of a gold standard and a gold currency; from this remark it follows that no limit should have been placed on the expected rise in the value of the rupee; by fixing the maximum value of the rupee at 1*s.* 4*d.*, the Indian Government notified to the financial world and to exchange banks and dealers the highest price they would have to pay for remittances to India; in fact anyone depositing a sovereign knew he could always receive 15 rupees; so that a very strong inducement, in fact more than an inducement, was held out to the financial world to withdraw floating capital from India, when the exchange was 1*s.* 4*d.*, on the presumption which has often been realised that money could at certain times be sent back at a lower rate of exchange.

7611. Do you know that there was a difference of opinion amongst the members of the Herschell Committee about that 1*s.* 4*d.*?—Yes.

7612. You may remember that Mr. Bertram Currie was strongly opposed to that?—Yes. I think it right to mention here—although perhaps it has nothing to do with this part of the question—that there is an idea among a great many, that if you could only assimilate the currency of India, or the standard, to that of England, money would flow to India in time of stringency as it does to London when the Bank rate is raised. Now the Committee must bear in mind that the circumstances of the London market are not only very peculiar, but quite exceptional, namely, almost the whole trade of the world is effected by means of bills on London, and during every day of the year large amounts of bills fall due for foreign account which have to be met at maturity. As a rule these drafts are met by other long drafts which are discounted in the open market here. Now, when from exceptional circumstances the rate of discount rises here, it naturally pays those who are indebted to this country to remit gold rather than long bills. As far as I know, India is not in a similar position, and the only way in which capital goes to India for a short period is through the intermediary of the exchange banks; they can tell you better than I can how far it is possible with safety and prudence to lend money in India; no doubt occasions do arise when rupee stock finds its way over here, but I think, so far as this discussion is concerned, nothing that can be done would place an Eastern State on the same basis as an European one.

7613. You mean in the automatic flow and reflow of gold?—Not of gold, but money for short periods. When the Indian Government closed the mints to the automatic coinage of silver, the Indian Finance Minister and the Indian Exchequer were put in exactly the same position as the Russian Finance Minister and the Russian Exchequer have been in the last 10 years. Russia has during the last 10 years been creating a large reserve of gold; I believe it now approximates to 130,000,000*l.* This reserve has been created, first, by keeping in Russia the produce of the Russian gold mines; secondly, by receiving the coupons of her external debt as customs duties, as well as receiving those duties in gold or in the bank notes of England or France, which is exactly the same as gold; thirdly, by large borrowings outside of Russia, and redemption of internal loans; and fourthly, by exchange operations, when considered necessary by the Minister. I will explain this: at times Russia has had a superabundant harvest, and there has been a plethora of bills offering for sale; the Russian Government have never hesitated one instant; they depressed the exchange, which was a premium on exports, by becoming large buyers of bills, and, whilst they were borrowing abroad for their general purposes, ordered gold to be sent to them from the proceeds of these bills. I am perfectly well aware that it is difficult to compare the action of the Russian Government with that of the Indian Treasury, insomuch as one Government is quite autocratic while the other has to a certain extent to depend on the sanction of the English Parliament. At the present moment the Indian Government have just floated a loan for 6,000,000*l.* in England, and if report is to be believed, they are about to issue a rupee loan for 2,000,000*l.* in India; the action of the Russian Government would probably have been a different one; they would have issued a loan for 8,000,000*l.* in

Right Hon. Lord Rothschild.

25 July 1898.

England, and would, in all probability, have sent 2,000,000*l.* of gold to Calcutta to be held against their issue of notes there, and would have coined a portion of the silver in their Treasury which would have been put in circulation, and it would not have been a disadvantageous operation. The Indian sterling loan costs the Government about 2¾ per cent., whilst rupee stock is now sold in England and India to pay 3½ per cent. Notwithstanding the facts which I have mentioned above, that the present condition favours other silver-consuming countries, I should never have advocated the re-opening of the mints unless by arrangement with other nations, and I consider it a mistake on the part of the Indian Government discarding in the way in which it has done the proposals made by America and France last year; naturally India should have reserved her right to coin gold as well as silver, but the other conditions raised by France and America were conditions which regarded not India but England, and although I consider the majority of the conditions not only impracticable but absolutely impossible, the question for Her Majesty's Government in London to consider was, and is, which sacrifice is preferable—to help to reopen the mints to the free coinage of silver, or to assist the introduction of a gold standard and currency? Before answering the question of a gold standard and currency for India, I must be allowed to remark that at present there can be no analogy between a country like Egypt and India as it is to-day. To begin with, there is no importation of silver into Egypt, and if you wish to establish a gold standard and a gold currency in India you must either absolutely prohibit the importation of silver into India from private sources which always will leave the Government of India the right to buy silver if they want it, or put such a heavy duty on the importation as to make it prohibitive. I think I ought to remark here that, since writing this, I have seen various gentlemen who are connected with the trade of India, and they assert that silver is now a commodity, and that you would have no more right to prohibit the importation of a commodity like silver than you would to prohibit the importation of any other commodity, but that you would have a right to put a very heavy duty on it. I personally do not think that silver is introduced so much as a commodity as a form of currency, which the native prefers; but, as I say, I have not been in India myself, and therefore I can only speak from hearsay. You must also bear in mind that since the British occupation of Egypt, not only has the drainage of gold to Constantinople completely ceased, but also that the interest on the debt has been considerably reduced. Large irrigation works and light railways have been constructed, and are still being constructed, with the aid of foreign capital, the area of land under cultivation has considerably increased, and with the area the exports have considerably increased, besides which, the increased number of travellers to Egypt alone accounts for the automatic flow of gold to that country. In considering the question of a gold standard and a gold currency for India, one can only compare the circumstances to those of, say, Austria and Russia. Both those countries had, no doubt, in former times, made a somewhat free use of the printing press. I think I ought to mention here that although both Austria and Russia had State banks, in time of difficulty the State issued notes of their own, which passed as legal tender.

7614. Were they inconvertible?—They were inconvertible. When they determined on a gold standard no more notes were issued and the influx of silver stopped; the silver in the possession of their Treasuries being used for fractional currency; similarly, it would be necessary for the Indian Government to stop the influx of silver, and the next step would be to raise a loan in England for the purchase of 18,000,000*l.* or 20,000,000*l.*, in order to buy gold to be held as a reserve against the notes now issued against silver (at present held by the Indian Government), the silver being in future reserved for fractional currency. I am afraid my evidence may startle some nervous people, but I have no intention of advising that the 18,000,000*l.* or 20,000,000*l.* of gold should be purchased at once; the operation would naturally extend over some years, as the Austrian and Russian operations did, and would require very careful manipulation and knowledge of the markets of the world. On the advisability of a gold standard and a gold currency for India—and I cannot separate them, though for a time the gold may not be put into circulation—I must emphatically remark here that a change of that kind, desirable as it may be in the interests of India, will be of no avail and will effect no permanent good unless steps are taken to increase the exports of India, because it is on the magnitude of the export trade that the future of a gold standard and gold currency depends. It is quite true that the staple trades of India—cotton, jute, indigo, wheat, and tea—are the results of private enterprise, but the opium trade, which is not only of great benefit to the Indian Revenue, but also affords an article of export to China, shows how in a country like India trade may be fostered. If the Indian Government had pursued the same policy with tobacco as they have with opium and with other articles, such as silk, &c., there would probably be at the present moment a much larger balance of trade in favour of India, which of itself would, if there had been no limit to the value of the rupee, have solved some of the existing difficulties. He would be a rash man who affirmed that the American currency, as it now stands, is on a sound and satisfactory basis; twice within the last 10 years have the United States Government been obliged to raise large loans for the purpose of obtaining gold; but what is the present state of America? During the last 12 months her exports have been just double her imports;—240,000,000*l.* against 120,000,000*l.*, and these exports have not consisted entirely of agricultural produce or of minerals, but to a large extent of marvellously finished goods, electrical apparatus, and machinery to all parts of the world, railway engines, and even rails to India and Australia. Naturally, America has been greatly benefited by her splendid system of railways, and when on the subject of railways, I must say here that in my opinion any amount of capital could be found in England for Indian enterprises, such as railways and irrigation works (naturally some guaranteed and some unguaranteed), if the Indian Government had given more facilities and had been more liberal to private enterprise. Whenever a railway concession has been granted to a private individual or a company, the Indian Government reserved to itself the right of repurchasing the enterprise after the lapse of a certain time, making the investment of capital unattractive. The same policy applies to the development of minerals in India and Burma. I personally have no doubt that under generous treatment the capital required for the development of India could be found in the London market, but as this is only one of the side-issues raised I must again refer to the main question, viz., Which is the best currency to be adopted for India? The authorities at Calcutta, having discarded all idea of an international arrangement for the renewal of bimetallism—I suppose there is nothing now to be said on that question: and your Committee have now to decide between a gold standard and gold currency pure and simple, and between the continuance of the present arrangements with such improvements as past experience has proved to be necessary. With my small knowledge of India I should not venture to express an opinion upon the desirability of a gold standard for that country; if it were introduced it probably would be judicious to fix a higher rate as the value of a rupee than 1*s.* 4*d.*; the savings in exchange would partially recoup the Government for the loss of interest on the loan to be raised, and for the possible, I will not say permanent, but temporary, falling off in the revenue owing to the new circumstances which a change in the currency would bring about. It would naturally take some years to establish the gold currency. One of the

points on which there has been much discussion is the fact that during a long period of years, namely, from 1835 to 1895, the net imports of gold into India amount to nearly 150,000,000*l.*; none of this gold is visible to the naked eye, and it is presumed it is hoarded by the natives; how far this is a fact I do not pretend to say; silver coinage is naturally used for daily purposes, and the supposed hoarding, particularly of small bars, of which I have brought a sample, may be no more or no less than the sovereigns which some people carry about with them. To outside observers the closing of the mints has probably increased the desire for hoarding, and silver and gold bars which are freely sold in the native bazaars pass for money instead of a coin with the Sovereign's head. If it were clearly proved that in an European State with a paper currency there were hoardings of gold amounting to more than 100 millions sterling, it would lead one to believe that the adoption of a gold standard and gold currency could be more easily effected, and that ultimately those who hoarded the gold would exchange it for bank or State notes. I mention that because it is a fact that in 1870, at the time of the Franco-German war, the Bank of France had to suspend cash payments because there were great hoardings of gold, and confidence was restored. The same thing happened in America during the Civil War, and also on other occasions. I think you may take it for granted that in a civilised State, where there is hoarding, it is a very easy matter for the restoration to a gold currency. How far this may be the case in India I do not pretend to know, but considering that India is administered by Englishmen, that her credit stands higher than that of almost every European nation, England excepted, and that she has at present a surplus of exports over imports (certainly a large surplus if you deduct the silver), it would appear to outside observers as if the elements for the introduction of a gold standard were not wanting in India. I have treated this question simply from the point of view of the possibility of introducing a gold standard and not from the point of view of the effect which a further fall in silver might have on the exports from other silver-using countries. If the Committee should discard a comprehensive scheme for altering the currency, there remains nothing but to consider what can be done to alleviate the ills which the present system is said to have created. The prevalent idea seems to be that if you could ensure a certain fixity of exchange money would flow to India; my belief is that the Indian Government will attract money to India for public works and for great undertakings if they set to work in the right way. I also believe, although I may be quite wrong on the subject, that quite apart from the fluctuations in exchange, the great banks which now carry on the Eastern trade have discovered that the right and only policy for them to pursue is to keep their capital intact in London and to be continually sending it backwards and forwards. The policy of borrowing money in London and allowing one's agents in distant branches, not only in India, but elsewhere, to lend it out on security, the value of which is unknown at the head office, has been curtailed for a great number of years. Two proposals have been made for remedying the present evil, the one is Sir James Westland's and the other is Mr. Lindsay's. There are, in my opinion, two fundamental errors in Sir James Westland's proposals, the first is that in order to remedy the present evils he would increase them tenfold by creating an alarming stringency in the money market, the second is the proposal for melting down rupees and selling silver bullion. The sale of the silver bullion in India would not prevent the importation of that metal; it would considerably knock down the price, and in that way, according to Sir James Westland's own showing, in his despatch about bimetallism, would benefit the trade of other silver-using countries. Mr. Lindsay's scheme has, on the other hand one great and distinct merit, he recognises that the closing of the mints was a blow to what I may call free trade in currency, and has put the Indian Government in the same or a similar position as the Russian Government was in some years ago; his remedy, however, is a very doubtful one; he proposes to be a seller of drafts on London at 1*s.* $3\frac{3}{4}$*d.*, so that whenever the exchange is below this fixed price the exchange banks and others who are continual buyers of Council drafts would avail themselves of his offer. At the same time he proposes to draw on India at 1*s.* $4\frac{1}{16}$*d.* Now during the last five years the average for Council drafts has certainly not been higher than 1*s.* $2\frac{1}{2}$*d.*, and this although repeatedly during this period the Indian Council has stopped drawing altogether. I fail, therefore, to see how he will be able to draw on India at 1*s.* $4\frac{1}{16}$*d.* The idea that a man would buy a Council draft at 1*s.* $4\frac{1}{16}$*d.* in order to secure a comparatively high rate of interest for a few months, and when he knows that he will probably lose 2 per cent. on his remittance home is one of those problems which I cannot solve. I should like to explain that rather more fully. As far as I understand Mr. Lindsay's scheme, he says money has been worth 15 per cent. per annum or more in India; 15 per cent. per annum is $3\frac{3}{4}$ for three months, and he and his friends in various documents have stated that, when money is dear outside London, people send it to Germany or Paris or New York for three months. Now, suppose Mr. Lindsay's scheme were in operation, what would be the effect of that? A man would have gone to the Gold Standard Office, as he calls it, and have bought a draft on London at 1*s.* $4\frac{1}{16}$*d.* in order that he might lend the money for three months at the rate of 15 per cent. per annum, or $3\frac{3}{4}$ per cent. for the three months, although he knows that it will cost him 2 per cent. presently to remit his money home. Mr. Lindsay thinks that that is likely to happen. I think it is ridiculous. If it is intended to regulate the fluctuations in the exchange by means of a large bank, then I may be allowed to mention that during the last few years of the reign of Don Pedro Segundo in Brazil, a large bank was started with the object of improving and regulating the exchange; the capital for this bank was easily subscribed both at home and in Europe, and when their drafts on their correspondents first appeared the effect on the exchange was no doubt considerable, but as is usually the case with operations of that kind, the bank lost very large sums of money by their operations, and certainly produced no permanent improvement in the exchange. I would mention another case famous in financial history, but it was long before my time, namely, the United States Bank, which was founded between 1830 and 1836, the primary object of which bank was to regulate the exchange between America and England—and as you, sir, and the Committee are no doubt aware, the failure of the bank was disastrous, and brought down a good many houses at the time. If a bank were established to carry on the exchange business suggested by Mr. Lindsay it would probably have to be affiliated to the present exchange banks so as to avoid competition, and then in the interests of its shareholders it would always be more or less in open competition with the Government. It is perfectly true that various Governments during the present generation have reverted to a gold standard and currency; the American Government after the Civil War, for a time, collected their Customs duties in gold, and then made a loan for a certain amount which enabled them to say that their green-backs and national bank notes were redeemable in specie; they have had twice to come to the assistance of their note issue, but during the last 18 months the tremendous prosperity of the United States has done more for their currency than any legislation. After the war of 1870 the indemnity which the German Government received from France enabled them to change their various existing currencies into a gold and monometallic basis, although I have been told that at the present moment the Bank of Germany still holds a certain amount of silver which is calculated as gold. Russia has taken

Right Hon. Lord Rothschild.

Right Hon. Lord Rothschild.

25 July 1898.

nearly 10 years to establish a gold currency; she was probably helped by the produce of her own mines, but the efforts and the sacrifices have been heavy, and, curiously enough, now that the gold currency is established, the great difficulty for the Russian Government is to get the gold into circulation; the Russian peasants still cling to the idea that the double Imperial only represents 15 roubles of paper money, and cannot make out why they are called upon to give up 20 roubles of paper, the Russian Government having fixed a par of exchange at about 25*d.* per rouble, instead of 37½*d.*, as it was formerly. The Austro-Hungarian Government, who, like the Russian Government, had issued a large quantity of paper money in time of war, borrowed 30,000,000*l.* to redeem that paper money—they were helped at first by abundant harvests, and although the bank does not part with their gold freely, still they are obliged on occasions to let some of the gold out which has lately shown a disposition to come over the border. What the cost to the Italian Government was to try and secure a gold currency, Mr. Hambro, a member of your Committee, will be able to explain better than I can, but gold coins are certainly very scarce in Italy just now. Owing to the great depreciation in silver, Chili made an attempt a few years ago to introduce a gold standard, but it has not so far proved a success, and the same may be said of Japan, the latest convert to a gold standard. If India is to adopt a gold standard and currency, she will have to make long and steady preparations as the Russian Government did, and although the amount of gold she would require might at first sight seem large, it must be remembered that the annual production of gold is now 45,000,000*l.*, and is rapidly increasing every year.

7615. That is the annual production throughout the world?—Yes. I think, myself, it would be nearer 55,000,000*l.* than 45,000,000*l.* sterling; but I do not say that with any authority. To sum up, I do not venture to advise the adoption of a gold standard and currency for India as I am practically unacquainted with the country. I have merely attempted to show that Sir James Westland's scheme is impossible and that the Lindsay scheme as it now stands would not effect any of the reforms expected from it, and I would only repeat in conclusion that, to my mind, the principal object to bear in mind is to increase the prosperity of India by developing and opening up that vast empire, thereby increasing her capacity for exporting. It should not be forgotten either that the policy of closing the mints has, perhaps, hardly had a fair trial, as during the last three years India has passed through a series of calamities, such as famine, plague, and frontier wars, from the effects of which misfortunes she is only just recovering; and that it is to be hoped she will now enter upon a period of calm and prosperity which will enable her to derive the full benefit from her great natural resources.

7616. I am sure we are exceedingly obliged to you for your paper. I only want to trouble you with two or three questions. First, with reference to those gold bars that you produced to us. Can you give us any idea of the number of those bars that are sent out to India?—I had the accounts made out from the Wood Street Smelting Works of the number of bars made in 1893, which was the year that we purchased it. From 1893 down to the first five months of 1898 we made 5 millions sterling worth of these bars. The first fortnight of June of this year we made 376,000*l.* worth of these bars. The clerk told me the other day that he had not got the figures, but he said there had been a steady increase. I asked him why, and he said it was probably owing to the sudden rise in silver, which is, perhaps, due to a certain extent to the scarcity of silver, and also due to Spain coming in and being a large buyer of silver. I telegraphed out to the two chief smelters of the United States to ask them if they would furnish me with a return of the silver production of this year. This is the answer that I have had: "United States silver production "last year, 56½ million ounces; Mexico, 54 million "ounces;" that is altogether 110 million ounces, and I think you may take it that, with the exception of a very small quantity which was produced in Australia, America and Mexico are the chief silver-producers of the world now. "No statistics this "year; do not anticipate serious change in other "countries; anticipate 2*s.* 10*d.* would not materially "increase production in Mexico or States, because in "Mexico the principal items entering into cost are "paid for in silver, and silver produced from bye-"products and high-grade ores in a country will be "produced in any event, and it requires an enormous "quantity of low-grade ores to materially increase "production. I anticipate considerable increase in "production of silver if advanced to 3*s.* 3*d.*"

7617. (*Lord Balfour of Burleigh.*) What does 2*s.* 10*d.* mean?—That is the price per ounce of silver.

7618. (*Chairman.*) What becomes, in your opinion, of those bars when they go to India?—I have asked one of the highest authorities that I know in Indian matters what becomes of them, and he says the majority of them are taken by the Indian bankers as a reserve. I must tell you that some bars do come back from India. It is a very curious thing. It is not the bars that we make that come back, but the bars which are sent from China, which are not smooth, but rough. We have never had a bar back from India of our own manufacture.

7619. The effect of that would be to strengthen the argument of those who hold that gold is hoarded in India?—Yes.

7620. I gather that your opinion, on the whole, is to go on as we are?—Unless you make up your minds gradually to introduce a gold standard and a gold currency together.

7621. You think a gold standard without a gold currency impossible?—I do, and I would go still further. I think if you make up your mind to introduce a gold standard and a gold currency together, you must be prepared on occasions to send gold back to London. I asked on Friday what was the amount of gold that we sent to Russia in 1891–92 for account of the Russian Government. I find that in 1891–92 we sent 8,550,000*l.* of our own gold and 1,500,000*l.* for the Bank of England, but against that in 1890—that was the time of the Baring crisis—the Russian Government sent 1,500,000*l.* of gold to the Bank of England which they lent them, and they sent us 1,500,000*l.* Again, on various occasions, when money has been very tight in Germany, the Russian Government has never hesitated to send gold out of the country, although they were preparing for a gold reserve. If the Indian Government were to make up their minds to go in for a gold standard and a gold currency they must also make up their minds at times to send gold back. They cannot introduce a great change in the Indian currency and say "We do not "care about the money market, that must take care "of itself." They must be prepared to act with a bold hand and to send gold out.

7622. (*Sir F. Mowatt.*) That is to say, there would be a mutual desire for accommodation between London and India?—Yes.

7623. (*Chairman.*) What time do you consider would be sufficient to establish a gold currency in a normal state of affairs?—My idea was that the Indian Government, as a Government, would only have to provide about 20,000,000*l.* of gold, and that, either by preventing the importation of silver, or by putting a heavier duty on it, a certain amount of gold would flow automatically to India, and I would have supposed that it would not have taken India more than two years, if so long. I wrote to Vienna and asked them for particulars of what happened there, and they sent me this paper in German. They raised, I think we may say, 30,000,000*l.* sterling, but they only bought 20,000,000*l.* of gold; and they put a foot-note here showing that it did not take them three years to bring about the change. Now if Austria can do that in three years, India can certainly

do it much more quickly, backed up with the credit of the English Government.

7624. Do you attach supreme importance to there being a stable rate of exchange between India and this country?—It depends what you mean by a stable par of exchange. I do not think, even if you had a gold currency, you could keep the exchange within certain points. Within limits, I think it is always a great advantage to a country having a stable exchange rather than when it fluctuates very widely.

7625. (*Lord Balfour of Burleigh.*) I wish you would explain to my uninitiated mind on what ground you say a gold standard cannot be introduced without also a gold currency in India?—I have tried to find out what is meant by a gold standard, and I have not been able to solve it myself.

7626. One of the few things which I think everybody here has agreed in representing to us is that a gold currency would, in India, be quite useless, because the transactions are so small in amount that even silver is too expensive a medium, and that in fact most of the transactions are in copper. What I understand is meant by a gold standard is this, that people who have large transactions, chiefly export trade with gold-using countries, should be able to exchange gold for rupees and rupees for gold at a previously-announced rate. Now the question I want to put is, why, in your opinion, is that condition of affairs necessarily linked with what you describe as a gold currency?—My experience is that you will never be able to secure what you call a gold standard unless the Government has got the gold coins to give to those who want to export, and not bills.

7627. Undoubtedly, and I think it has been proposed to give gold coins to those who come and ask for them at certain rates. That is the intention?—The moment you establish a machinery for dealing in bills, the doubt arises in the minds of those who are dealing, and the doubt becomes a certainty, that they cannot get gold, and the whole thing always fails.

7628. I put a hypothetical question. I know you think that Mr. Lindsay and Sir James Westland are wrong in the particular methods of working that they suggest, but suppose for a moment that they were right, do you think that their schemes for a gold standard would be then a success or a failure?—I have tried all I can to separate the two things, and I cannot separate them.

7629. I understand you also to take exception to the special figures suggested by Mr, Lindsay—1*s.* $4\frac{1}{16}$*d.* for drawing on India and 1*s.* $3\frac{3}{4}$*d.* the other way—on account of what you put to us very lucidly, that that would mean a loss of 2 per cent. in moving the gold back again to this country, after it had been profitably employed for only three months?—Yes.

7630. But do you not think that it might lead to gold going out to India and remaining there longer than the three months, on the ground that although it would not be so profitably employed in the slack season as in the busy time, it would still get a remunerative rate of interest?—I have tried all I know to solve Mr. Lindsay's scheme and Sir James Westland's scheme, and I do not think it would solve the question at all. I think it is simply and purely an artificial thing, and all artificial things always break down. If you were to stop the importation of silver into India now, completely, gold must flow there owing to the balance of trade in favour of India, but any scheme like Mr. Lindsay's scheme is so artificial that it could not last.

7631. Do you apprehend that too much gold would go to India?—No gold would be taken to India under Mr. Lindsay's scheme. You would have exactly the same thing as happened in the case of Brazil and the United States of America. They would begin by raising a loan here. Mr. Lindsay says he does not mind if he raises a loan here of 5 millions, 10 millions, or 15 millions sterling. The Department in India would be a continual drawer on London, and the money they have here would be exhausted very quickly.

7632. I am sure you will not think I am in the least wishing to catch you by a phrase in the question I am going to put to you, but the difficulty you put before us now, viz., that no gold will go to India, is somewhat different from the statement that is given in the second last paragraph of this letter which is very influentially signed, and among the signatures to which I see the name of your firm?—At the time that letter was prepared it was supposed that a loan was going to be raised here. The Lindsay scheme was not gone into at all.

7633. No; but their apprehension is "lest a policy "should be adopted which would involve the raising "of sterling loans here of large and indefinite amount "for remittance in gold to India"?—They did not go into the details at all. The idea when that letter was signed was just as it was in India when the question of bimetallism arose.

7634. Of course we recognise that that is not intended either in the Lindsay scheme or the Government of India scheme?—That was the idea when that letter was signed. I think when that letter was signed they were thinking more of Sir James Westland's scheme than the Lindsay scheme, and Sir James Westland proposes, you will remember, to raise loans of 20 millions and send the gold out and sell the silver. I do not think the signatories to that letter ever thought of the Lindsay scheme.

7635. I want to take it for the moment as much against Mr. Lindsay's scheme as possible?—I think this is Mr. Lindsay's scheme. Five millions or 10 millions to be raised in London, and deposited in the Bank of England or a Gold Standard Office, and against that you would sell rupee drafts at 1*s.* $4\frac{1}{16}$*d.* from the Indian Gold Standard Office. I have read his statement over and over again. Mr. Lindsay's scheme is based on an idea which was proved to be a very fallacious one, that you could so manage the thing that you could continue to draw backwards and forwards without any great loss; it is what would be called in the City kite-flying.

7636. Some people have come here hostile to Mr. Lindsay's scheme, and have stated as an objection to it that the liability to send gold to India would not be limited to the five or ten millions first borrowed, but that it might go on to an indefinite amount, and in that way would do harm to the London market. It is not Mr. Lindsay's idea, but it is a criticism of Mr. Lindsay's scheme by some people who have come here to break it down, and I want to know what you think of that criticism?—I tried to study Mr. Lindsay's scheme, and I have read it over and over again, and I think the chief merit that he puts forward is this: He says capital would flow to India because people would know that they would always get their money home at 1*s.* $3\frac{3}{4}$*d.* Well, if Mr. Lindsay advertised that he was a seller of drafts at 1*s.* $3\frac{3}{4}$*d.*, and that there were no commercial bills offering at that price, people would take their remittances under Mr. Lindsay's scheme.

7637. What would be the result of that?—The result would be that after the 5,000,000*l.* were exhausted, people would have to rely on the ordinary trade bills.

7638. Then you do think that the 5,000,000*l.* would be exhausted, and it would go to India?—I do not say that the money would go to India. The Indian Government would borrow a large amount of money here, say, 5,000,000*l.*, and that would enable those who send out gold to India always to get remittances at 1*s.* $3\frac{3}{4}$*d.*, and they would take advantage of it.

7639. Do you care to say whether any modification of Mr. Lindsay's scheme would get rid of your objection to it?—I said that Mr. Lindsay was the first person who recognised and recognised publicly, that the moment you close the mints, and you stop what I call free trade in currency—the automatic flow of currency to that country—Government has to do something; but as to saying that anything artificial of that kind is a permanent cure for the evil, I contend that it is not.

Right Hon. Lord Rothschild.

25 July 1898.

7640. Do you think that if the operation was spread over a period of years, any detriment would ensue to the London money market and to London interests by the transference of 10, 12, or 15 millions of gold to India?—No, not in the slightest. Mr. Hambro will tell you that we sent 6,000,000*l.* of gold to the United States in six months, and no one knew anything about it.

7641. (*Sir F. Mowatt.*) Did I understand you to say, speaking of the importation of gold in these bars into India, that they in any way got into the currency?—I began by saying that I had not been to India myself, and so I do not know it, but I am told that these bars do represent currency to a certain extent. How far the silver bars represent currency, and how far they are turned into jewellery, I cannot tell you.

7642. The broad fact remains that since the closing of the mints, between 4,000,000*l.* and 5,000,000*l.* sterling worth of silver have gone every year to India?—The total consumption of silver by India and China and the Eastern States, since the closing of the mints, has been 75,000,000 ounces, if we take silver at 24*d.* the ounce.

7643. When you say that it is essential to the establishment of a gold standard that silver should be practically prohibited, that means that it would otherwise get into the currency?—Yes.

7644. And if, as we have been assured here by those who are best qualified to speak for India, silver does not get into the currency that would so far remove the objection, would it not?—Yes.

7645. I think you told us that the great element of failure in Mr. Lindsay's proposal was that it would practically cost the capitalist 2 per cent. to send out his money and get it back for a mere increase of interest for three or four months, but might not he think it worth his while to send his money out, not for three or four months, but for so many months that he might catch the two busy seasons at the rate of 10 or 12 per cent., and get 5 or 6 per cent. during the interval, and still only pay 2 per cent. for the entire period, which would apparently leave him a considerable profit?—Now you are entering into a very big question. I do not, myself, believe in the automatic flow of capital from one country to another in such a period as a year. I think you will find that capital leaves one country for another for a short period. When you talk of lending money for a year, I do not think it is the high rate of interest that tempts people. I think capital will flow to India for private enterprises if enterprises are presented to the investor and he thinks that he can make a permanent profit out of them. When you talk of coming to the relief of the money market, that will only be for a short period.

7646. But would not the instance I have put to you be very tempting to the investor. Take 12 months—during eight months of which he gets 12 per cent. interest, and during four months of which he gets 6 per cent.; that is as compared with 2¼ per cent. in this country, and it only costing him 2 per cent. on the entire operation. Would not that be tempting to him?—I do not think so, considering the risk he would run.

7647. But there would be no risk?—It is not the risk of exchange merely, it is the risk of the security.

7648. Now you say that 2 per cent. is prohibitive, but it is not of the essence of Mr. Lindsay's scheme that the margin should be so wide as that. He suggests that sum, but supposing the margin were reduced to, say, 1 per cent.?—I do not know what the essence of Mr. Lindsay's scheme is, but I had a large number of critieisms of Mr. Lindsay's scheme sent to me from India, and they seemed to think that the margin was not sufficient. When I read that I was rather astonished.

7649. (*Sir J. Muir.*) You are aware, I have no doubt, that the merchants of India, both importers and exporters, are exceedingly irritated at present on account of the high rates that they have had to pay for money, 10 and 12 and 13 per cent. in the Presidency towns, Calcutta, Madras, and Bombay, and in Bombay we had evidence that native merchants who hold Government paper went to the manager of the bank and pressed for money. They had been refused at 13 per cent., and they said, "Here is Government "paper; we must have so many lakhs of rupees, for "which we will pay you any rate of interest you "choose to ask us up to 18 per cent.," and the answer was, "I would most willingly help you, but it is not "in my power to do so." Now, suppose such a state of matters were brought about in the City of London, that is to say, that through what Mr. Raphael called the arbitrary and despotic action of the Government, London merchants had to pay anything like 12 per cent. for money, what would be the effect?—I do not know whether I understand your question correctly. You begin by stating that in Bombay and Calcutta and Madras it was impossible to get money on Government security under 15 or 18 per cent.

7650. Not even at 18 per cent.?—And that that, according to the native mind (and in natives I include Englishmen in India as well as native Indians proper), was owing to the despotic action of the Indian Government. I understand that you ask me my opinion upon that point.

7651. Yes?—The matter is rather complicated. If money were at 15 or 18 per cent. here the Bank of England would probably go to the Government and ask to be allowed to suspend its charter, and in that way they would make money easy. But the circumstance you have quoted is, I think, the strongest evidence that you could possibly have against the Lindsay scheme, because if Bombay had been in any other country, and money on rupee stock had been 15 or 18 per cent.—suppose it had been America as America was when they had a financial crisis, or suppose it had been Austria, the rupee stock would have been shipped to London, and they would have drawn against it, as the American shipped all kinds of securities here in one of their financial panics; they drew against it and gold was sent out. At the present moment there would have been no difficulty in doing that, because they could have got any money they liked on the rupee stock—40 or 50 per cent. of its value—and they would have relieved the market. The statement you make of the impossibility of finding money against rupee stock has always been in my mind the strongest argument against any scheme like that of Mr. Lindsay.

7652. Not only that, but we were informed that while this is the state of matters there are large amounts in rupees hoarded—laid up by the Government in the Treasury in Calcutta and elsewhere, and that the Government refused to let the rupees out?—I have always thought that the policy of promoting stringency of the money market in order to affect exchange was a wrong one. That is one of the great reasons why I think Sir James Westland's scheme perfectly impracticable, and why to a certain extent the Lindsay scheme would be so too, because you would have ultimately to melt down rupees.

7653. Then you disapprove of the policy of Sir James Westland and the Government of India in trying to force up the rate of exchange, and in so doing to force up the rate of interest upon all the merchants of India?—You ask me whether I disapprove of forcing up the rate of exchange by increasing the stringency of the money market. I certainly do disapprove of it.

7654. I may state that merchants all over India, both exporters and importers, are looking for even a worse state of matters in the coming busy export season. That being so you would more emphatically disapprove of any policy which would lead to such a result?—Certainly.

7655. I was very pleased indeed to have your emphatic opinion (because we have had different views stated by two or three witnesses) that you approve of the magnitude of exports from India being largely increased so as to make as big a balance as possible in favour of India?—Yes.

7656. We had one or two witnesses who were more or less representing the Government of India, who would not assent to that principle, although it seems to me to lie at the foundation of all economy and business. I have nothing further to ask you.

7657. (*Sir D. Barbour.*) May I ask one question about Indian railways. I will not go into the matter at any length. Are you aware of any company which has made a railway in India under agreement with the Government, the shares of which are not now at a premium?—Certainly; I am aware of one.

7658. Which is that?—The line we made in Bengal; the Bengal Central, I think.

7659. That is, quite opposed to my information. Do you mean to say that the shares of the Bengal Central are not now at a premium?—They are at a tremendous discount.

7660. My question is, do you know of any railway in India, made by an Indian company, the shares of which are not now at a premium?—I do not think that that is a fair way of putting it. The Bengal Central Railway shares are not at a premium because ——

7661. At this moment?—The line was re-organised, and there was a great loss written off the share capital.

7662. But you cannot say that there is any company which has made a railway in India under agreement with the Government, the shares of which are not now at a premium?—I know that the Bengal Central was re-organised, and the loss was written off, but I forget now how that was done.

7663. My recollection is that the reorganisation took the form of a guarantee from the Government, and that at the present moment the shares of that railway are at a premium?—Yes.

7664. But can you say positively that a portion of that capital was written off?—Yes, a portion of the capital was written off. I remember perfectly that a large portion of it was written off. I cannot tell you exactly whether a portion of the capital was written off, or whether the Indian Government at the time said that they would not call up the capital, which would come to the same thing.

7665. When you come to read over your proof, perhaps you will insert in your answer what you find to be the actual facts of the case?—Very good.*

7666. Did you say that you thought that the closing of the mints had increased the tendency to hoard gold?—I think so, and silver too.

7667. I would like to keep to gold for the moment. If you look through the figures for the last 15 years you will not find any great increase, I think, in the net imports of gold?—Taking gold and silver together, I do not say that there has been a net increase, but there has been decidedly more hoarded.

7668. Do the figures show a marked tendency to the import of gold since the mints were closed?—I did not say there had been a large increase of imports.

7669. Has there been a large increase in the imports of silver?—You had 32 millions in 1890–91, and you have 44 millions now.

7670. And the year before?—The year before you had 25 millions.

7671. Do you find there has been, on the whole, a great increase?—I did not say a great increase, I said an increase.

7672. Has there been an increase?—Yes, there has been an increase.

7673. Now have you considered the fact that gold in India may be largely in the form of ornaments?—That I do not know; I have not been in India.

7674. If it were in the form of ornaments it would be less likely to be sent to the mints to be coined if there was a gold standard in India?—I could not tell you if it is to any extent in the form of ornaments or not. I know that they wear silver bangles, and they could always take them to be coined when the mints were opened.

7675. When the gold is put into ornaments the workmanship is worth something, and that would be lost to them if they melted down the gold ornaments to make coins?—I do not know that it is put at all into the form of coins. I have been told that it is not.

7676. Now you said that these gold bars were kept as a reserve by the Indian bankers?—Yes, I have been told so.

7677. Do you mean that all the bars sent out have been kept as a reserve?—I cannot say.

7678. Would you expect them to go on taking bars year after year, simply to increase the reserve year after year?—Yes. Here in England nobody keeps any reserve of gold or silver. You carry on the largest business in the world with the smallest reserve of gold or silver. If you go to Brussels, or Frankfort, or Berlin at the present moment, you see in the streets some official in a cart drawn by a dog, taking gold and silver from one bank to another, or from one shop to another. You cannot compare any two countries.

7679. I have no doubt that gold bars are kept as a reserve to a certain extent, but is that within your own personal knowledge?—No, as I said, I have no knowledge of India myself.

7680. The bars that you send out are pure?—Perfectly pure.

7681. I do not know whether you are aware that the native of India prefers pure gold for ornaments?—I do not know that.

7682. (*Sir A. Dent.*) I want to ask you about the secrecy that you suggest is necessary to carry out successfully any gold operations in India. You tell us that an attempt to start a large bank in Brazil was a failure, and that an attempt to do something of the same sort in the United States in 1830 was also a failure?—Those two banks were failures—the United States bank failed afterwards—but I was speaking of regulating the exchange by drafts backwards and forwards.

7683. Then you would not advocate any large national bank being started in India?—There are two distinct questions. It may be necessary in the interests of India to have a bank like the Bank of England. That is for internal purposes. That I know nothing about. I am not an Indian authority. But what I say is that any bank which is started for regulating the exchange, drawing on London and being drawn against, would be a failure and would lead to disastrous results.

7684. Then you also, I think, suggested that it would be very difficult for the Government of India to attract gold to the country, unless they did it by some quiet process?—Naturally; anybody who has been in business knows that you can buy any quantity of gold or silver if you are a business man, and if the Government fails to do it they employ business people to do it for them.

7685. (*Mr. Holland.*) You tell us that under Mr. Lindsay's scheme no gold would go to India?—I do not think it would.

7686. Perhaps you would admit that a policy which would not take gold to India would be one which would have no terrors for Lombard Street?—Personally I do not dread the efflux of gold; I should not like to see the Indian Government, or any other Government, go to the Bank of England and taking out 5 or 6 millions; but you must remember that every week you have very nearly half a million of gold arriving from Africa and from other places besides, and that, if the Indian Government does not buy, somebody else does.

7687. You dislike the idea of melting down rupees in order to remove a supposed redundancy of currency?—Money is frightfully scarce there, and I do not know how you are to deal with the rupees when you have melted them down. You can sell them to China and other silver-using countries, but what is the good of that?

* [*Note by witness*:—I believe the Indian Government increased the amount of the guarantee. The fact that certain Indian securities have risen in value does not affect my argument that when Indian securities are offered to the public, there is little or no desire to meet the wishes of the public.]

Right Hon. Lord Rothschild.

25 July 1898.

7688. Do you think it likely that there can be anything like redundancy whilst the money market is in such a state of stringency?—In any European country of course that would be impossible.

7689. You tell us that Sir James Westland's scheme, in your opinion, is impossible, and that Mr. Lindsay's scheme would not effect its object. Have you considered at all Mr. Probyn's scheme?—No, not at all.

7690. That involves a gold standard—not with a gold currency, but with gold bars?—I have not studied that.

7691. You tell us that you dislike very much artificial proposals in connexion with currency matters?—Yes.

7692. Do not you think that when the mints were closed in 1893 that was taking a long step towards artificiality?—No doubt it was, but the Indian Government had no other resource open to them. They could not put on taxes, and this was the smallest of evils open to them.

7693. You thought it was wise at the time?—I did not see what else they could do.

7694. But do you still think, in the light of subsequent experience, that it was a wise course for the Government to take?—I think if they had not fixed the limit of exchange at 1*s.* 4*d.*, and had been prepared to come to the relief of the market when there was stringency, and had not tried to influence exchange by making money dear, it would have been wise.

7695. You admit, do you not, that in order to make a gold standard effective convertibility is essential?—Quite.

7696. Convertibility from gold into silver, and also from silver into gold?—Yes.

7697. You also know that the Government of India do not propose, at present, to have convertibility from silver into gold?—Yes.

7698. And that you consider a very radical defect in their proposals?—Yes.

7699. (*Mr. Campbell.*) You expressed the opinion that it might take 18 millions or 20 millions of gold to establish a gold currency?—Yes.

7700. Would you propose to acquire that by borrowing, or by the natural operations of trade?—The Indian Government would have to borrow 18 or 20 millions of gold in order to get their gold for their treasury, just the same as other Governments have had to borrow.

7701. But if they could get it by trade balances ——?—They could not get it in any other way except by borrowing. They would require that in addition to the trade balances, because they would have 18 millions or 20 millions of gold notes out. I do not know the exact amount, but I take it at 20 millions.

7702. That would be if convertibility were declared right away?—I started on the assumption that the Indian Government had 20 millions of notes out, and that they would have to borrow a sufficient amount of gold so that the notes that they had out should always be convertible into gold. They would then use their silver for fractional currency, and the balance of trade would then supply India with the other amount which she would want if they adopted a gold standard. That is what I started with.

7703. Then you would not approve of deferring convertibility until gold had accumulated gradually?—I did not say that you would get the whole 20 millions in one year. You might get it in 18 months or two years, or three years; but when they had the gold for the notes that they had issued, the whole scheme would become effective. I know Sir Edgar Vincent thinks that you have only to declare that sovereigns are legal tender at a certain rate, and do nothing more. He says that is what he did in Egypt; but I do not think the two cases are at all analogous.

7704. You think it is most important in the interests of India that everything should be done to increase the volume of her exports and the balance of trade?—Yes, you will have seen that in America. You cannot get over the fact that twice in ten years they had a financial crisis, and that the moment the exports became so great, gold went into the country, and not only gold, but they bought a great portion of their own securities back.

7705. You said you thought that it would be desirable to raise the ratio higher than 1*s.* 4*d.*?—I thought that if you could raise the ratio higher than 1*s.* 4*d.* the Indian Government would save money which would repay them, but I am not sufficiently acquainted with India to know if that is possible.

7706. Have you considered the effect that that might have on the export trade? A rise from 1*s.* 4*d.* to 1*s.* 6*d.*, supposing the sterling price of produce remained unchanged, would mean a fall in the rupee price?—I know that is an argument which has been continually put forward, and I think if you look at the figures which the Indian Government gave you, you will find that the largest export of wheat was in 1893 when the rupee was at 1*s.* 6*d.*

7707. (*Sir. D. Barbour.*) It was in 1891, I think that the exchange was 1*s.* 6*d.*?—At any rate the largest export of wheat you ever had from India was when exchange was 1*s.* 6*d.*

7708. (*Mr. Campbell.*) Exchange, of course, is not the only factor in the business?—Oh, no.

7709. There is the question of seasons, crops, prices, and so on?—I mean I do not think you could argue on trade only; it depends on a great many other circumstances.

7710. Then you contemplate also that when the gold standard was established, gold might have to come home as well as to go out at a certain time?—Certainly.

7711. That would be acted upon by trade, in the same way that gold might go there to a large extent in one season and come away in another season?—I do not think you could have a gold standard and a gold currency unless you make up your mind that gold must go out sometimes.

7712. (*Mr. Hambro.*) Is it not the fact that dealers in money, or the people who move capital about from one spot to another, very rarely employ their money for more than three months at a time?—That is quite so. I have already said so.

7713. Your great idea is that the export trade is the great thing to be cultivated?—Yes.

7714. That would be most likely to increase, would it not, if more capital went into the country?—I do not know India. I do not think you can ask me a question of that kind when I do not know India at all.

7715. There is a great deal of uncultivated land there, is there not?—That I do not know.

7716. But I am stating that to you; there is a good deal of uncultivated land in India, and you have suggested that tobacco could be grown?—Yes.

7717. That would require capital in order to be grown to any extent; I mean if capital could go there to increase production that would be a good thing?—No doubt it would.

7718. Do you not think it would be most likely to go out if the rate of exchange was more stable, as it would be with a gold standard, for instance?—My personal idea is that capital will flow to any country if you can show a great profit for the capital. If you cannot show a profit the capital does not go.

7719. You do not think that the exchange being fairly permanent would be far more likely to take capital there?—As a matter of course, if you are going to have a state of affairs where the exchange is likely to continue falling on account of the depreciation of silver that will affect the country very adversely, but minor fluctuations would not affect the influx of capital if you were to show a large profit.

7720. Do you not think that everybody who has the moving about of capital would be much more likely to bring capital to India if he saw that there was actual gold in India than if he was only told that

he could buy bills on London?—I think that no bill scheme, if I may use the expression, like Mr. Lindsay's, will have any effect on people's minds.

7721. And confidence is the thing that you really want?—I do not think that any bill scheme would bring about confidence.

7722. And confidence is the thing that would take capital there?—Yes.

7723. Suppose you went on to a real gold currency, do you think it would be more easy for the internal arrangements of that currency to be properly looked after by a bank like the bank of England, or the Bank of France, or the Bank of Germany, rather than by the Government?—The internal arrangement of the currency is always better looked after by a bank than by a Government. The best proof you have of that is in the case of America, where the tendency arose twice to mix up the measure of the currency with the wants of the Treasury. The accounts were not kept sufficiently distinct. A bank would know that they were under the necessity of redeeming their notes in gold or silver, and they would keep the money market easy. In fact, a bank would never have allowed the stringency in the money market to arise as it did the other day in India, because they thought they could not convert their notes.

7724. I think America is a very good example, because although the law of America prescribes that one dollar shall be equal to another dollar, yet confidence has not always entirely been reposed on that statement?—I do not understand that question.

7725. In America the law states that one dollar shall be kept equal to another dollar; that the silver dollar shall be as good as the gold dollar?—I do not think anybody knows exactly what the American law does say. I do not think that the law is that the gold dollar is equal to the silver dollar.

7726. What I wanted to put was this, that as soon as the gold did disappear from the American Treasury, people lost to a certain extent their confidence in the power of America to maintain the par of exchange, and therefore visible gold is necessary?—The Government considered that they had sufficient gold to redeem their bank notes, and I can only suppose that they had to use that gold for Government purposes; but circumstances arose when there was no gold there and no notes, and therefore they had to make a loan.

7727. The moment the visible supply of gold disappeared the people lost confidence. You will not get confidence unless you have the gold there?—Certainly not.

(*Sir F. Mowatt.*) I should just like to understand that last answer. When you say unless you have gold there, do you distinguish between gold lodged in India and gold lodged in London?

(*Mr. Hambro.*) I distinguish between currency and standard.

7728. I do not know whether you thought that Customs duties ought to be payable in gold or not?—I did not go into that at all. I simply pointed out that at one time the Russian Government and the American Government did get a stock of gold by making their Customs duties payable in gold, but I personally did not advocate anything of that kind for India, because I do not pretend to know anything about it.

7729. (*Mr. Le Marchant.*) If such measures as you were describing for the introduction of a gold currency were adopted and it seemed likely that say, three years would be taken to establish the system, do you think that public confidence would be so far gained as to prevent stringency and very high discount rates in the interval? Do you think that capital would be attracted during that time into India so as to counteract the pressure for money?—You are raising a very big question there. You have had very great stringency in the money market in this country, and yet you cannot say that there is no confidence in the currency here. It is very difficult when you do not know India, or when you have not all the facts before you, to distinguish exactly.

7730. There would be no necessary connexion between a rate of exchange of, say, 1*s.* 4*d.*, and a high rate of discount?—I do not think so.

7731. If the gold standard and currency were established, do you think that would assist the construction of railways and the opening up of the country?—No, I do not say that the gold standard and gold currency would assist the construction of railways; but I think a gold standard and a gold currency would bring about what I call free trade in currency. As far as I understand the question, the natives (and in the word "native" I include real natives and the Europeans there) complain that the present arrangement brings about a false stringency in the money market which is injurious to India. I think that is the great complaint they have made, and they say that the dearness of money is destroying their trade. One of the chief objects that this Committee has is to find a remedy for that state of affairs. I say you cannot reopen the mints to the free coinage of silver; you are not prepared to go in for bimetallism, and therefore nothing remains for you in reality but to have a gold standard and a gold currency pure and simple. My opinion is that what is called a gold standard, regulated by bills, would not bring about an ease in the money market.

7732. Speaking generally, ease in the money market would contribute to the introduction of capital, would it not, and the general development of enterprise?—Certainly.

7733. And would that, in your opinion, lead to development of exports?—I have no doubt it would.

7734. Trade generally would follow that lead?—Yes.

7735. I think you were speaking of making the Government note issue convertible into gold; would you propose to limit the issue of notes, as the greenback issue, for instance, is limited by an Act?—What I understand to be the present position of India is this. The Indian Government has 20,000,000*l.* of notes in circulation; I should propose that there should be gold held in reserve against those notes, and that afterwards anybody who chose to send gold into the new Indian Bank or new Indian Treasury could get notes too.

7736. Under the existing regulations the public can claim that notes shall be issued to them against payment of rupees. So long as that option is open to them, would they not be able to convert rupees into gold without limit?—As a matter of course, if you introduce a gold standard and gold currency, you would have to stop that option.

7737. You would impose a limit in that way?—Yes.

7738. If such a bank as you alluded to were to be established, would it not be essential that it should have wide business relations with the country? If it were confined to a limited scope of operations, would it be in sufficient business touch with the community to exercise influence on currency and exchange?—I do not pretend to know sufficient of the circumstances of India to be able to say what would be necessary. All the European banks have a large business besides the currency, and I do not know how far that would be necessary in India. I have not sufficient knowledge of it to say.

7739. In the absence of extensive independent business relations, would it not partake of the nature of a Government office?—I am not sufficiently well acquainted with Indian circumstances to give an answer to that.

7740. (*Sir J. Muir.*) If I understand aright you stated that you approved of the closing of the mints, provided the Indian Government could not raise the necessary funds otherwise by increased taxation?—Yes.

7741. But if it could be proved that that was possible, then would that alter your opinion?—Well, I have always been told it is impossible.

Right Hon. Lord Rothschild.

25 July 1898.

7742. A great many of the merchants of India think it is possible. Supposing they are right, would that alter your view?—That is not a point on which I would like to give an opinion. I have always heard from high authorities that it is impossible, and I am obliged to believe them.

7743. (*Chairman.*) Is there anything that you would like to add that has not been asked you?—No.

The witness withdrew.

SIR FRANK FORBES ADAM, C.I.E., called and examined.

Sir F. F. Adam, C.I.E.

7744. (*Lord Balfour of Burleigh.*) You are, I understand, a partner in a firm doing a large business with India in exports from this country?—That is so.

7745. Those exports are mainly textile?—Yes.

7746. You were resident in India for 18 years from 1872, and have been resident in Manchester since that time?—Yes.

7747. You come to state your own opinions and those of the Manchester Chamber of Commerce, so far as they are in keeping with a resolution passed by the board of directors of the chamber on the 8th June 1898?—Yes.

7748. That resolution is this: "That it is neither "possible nor expedient to establish a gold standard "with a gold currency in India under the peculiar "external financial relations and economic circum-"stances of the dependency. And that in the opinion "of the chamber it would be well in the interests of "India to adopt the principle that the mints should "be reopened to the coinage of silver, the time and "conditions to be hereafter determined"?—That is the resolution.

7749. And that is the expression of opinion of the Manchester Chamber of Commerce with which you associate yourself?—Yes.

7750. Now in the first instance were you opposed to the closing of the mints in 1893?—I gave evidence before Lord Herschell's Committee for the purpose of showing that, in my opinion, the necessity had not been proved.

7751. Were you, or were you not, opposed to the closing of the mints in 1893?—I was opposed.

7752. Would you give us your reasons?—My reasons at that time were, first, that the necessity for closing the mints hand not been shown; secondly, that to close the mints to the free coinage of silver and not to introduce in its place a gold standard with an effective gold currency would prove a failure; that by divorcing the price of the rupee from the silver it contains, the export trade of India would be handicapped in the progress of years; although it might take some years to show it, in the progress of years it would certainly be handicapped in competition with other silver-using countries, which had the benefit of cheap silver. As far as I remember, those amongst others were the reasons that I gave to the Herschell Committee.

7753. Is there any other reason?—I am speaking from recollection, but I think I also pointed out that India had benefited, and had been more prosperous under a low rupee, and that if the mints were closed to the free coinage of silver, and the balance of trade did not turn sufficiently in favour of India to lead people to tender gold to the Treasury for which they were to receive 15 rupees per sovereign, in that case stringency of money would gradually arise, which would prove prejudicial to the export trade of India, upon which the Government of India would chiefly rely for maintaining a fixed par of exchange at 1*s.* 4*d.*

7754. Have the expectations of the Government of India, upon which they closed the mints, been realised?—I think the Government of India have been disappointed in their expectations. I understand that at the time of the closing of the mints in 1893, it was expected that the exchange value of the rupee would at once be raised to 1*s.* 4*d.* and remain there steadily; that gold would be tendered by the public in exchange for rupees at the rate of 15 to the sovereign, till in the currency reserve gold became substituted for rupees; that then, as more sovereigns were tendered to pay for a favourable balance of trade, Government would buy silver in the open market, coin rupees therewith, and pay them out in exchange for sovereigns at the rate of 15 to 1. In this way autonomy was to be reached, stability won, and a regular supply of currency eventually secured. The result has been a disappointment. The rupee has not been raised to 1*s.* 4*d.* in the way anticipated, stability has not been won. No gold to speak of has been offered in exchange for rupees. But a contraction of the currency has created a gradually intensifying stringency in the Indian money markets that has caused widespread dissatisfaction and produced a condition of things that is pronounced in both European and native mercantile opinion to be intolerable and unbearable.

7755. As a matter of fact the rupee for a certain interval of time has been very near 1*s.* 4*d.*?—The rupee has touched 1*s.* 4*d.* lately, and again gone back; but I am speaking over five years, and for three of those years the rupee was very low. A year ago it commenced to advance, and six months ago it reached 1*s.* 4*d.*, and rather over. Since then it has again declined.

7756. Do you think capital was being remitted home from India before 1893?—I think there always has been a certain amount of capital remitted home from India, and always will be, for the reason that a great number of men who go out in various capacities to India, either as Government servants or otherwise, invest their savings in India very often while they are there, but when they return to this country they prefer to bring with them what savings they have and invest them in securities that they can watch more easily than they could at so great a distance as in India. I think there may have been also, with regard to banking institutions and mercantile firms, a transfer of accounts. That is to say, that banks and merchants who may have held their money in India may have transferred it after the mints were closed.

7757. But my question was before 1893?—I do not think there was any great transference.

7758. Do you think it has been transferred since 1893?—Yes, in account. I should like to explain that if I may. Of course, if you have money in this country under closed mints on deposit, and you wish to transfer it to India, you must buy commodities if the rate of exchange is not at a price which would enable you to send gold and receive rupees from the currency reserve in India. If you buy commodities, and when they arrive in India you sell them and receive rupees already in circulation, you take those rupees either from a deposit already existing in a bank and transfer it into your name, or you take them from the open circulation, in which case you reduce the accommodation which may be required by the man to whom you pay them over in exchange for your produce, but you do not add in any way to the active and effective circulation.

7759. I need not ask you, I suppose, this question: You are not satisfied with the present state of affairs?—No, I think the present position of affairs is working towards a state of matters which will prove very serious to the prosperity of India.

7760. Are you able to say whether Indian discount rates have been higher since 1893 than they ever were before?—I think, undoubtedly, they have been very much higher during this last two years than they were for a long period before. I am speaking from recollection now, but it must be 20 years ago—I am sorry I cannot give you the year—when for a short time the rates were high, but I think myself that never before, at least, not in the memory of any of us, have the rates of money continued so high as they have been during the last six months, and for a part of

1897. I think on the average they were higher in 1896 than in 1894; higher in 1897 than in 1896, and higher up till now (the average I mean) in 1898 than in 1897.

7761. I suppose that you are familiar with the circumstances of 1889-90?—I was in India in 1889.

7762. The maximum rate in both those two years was very high in each case in the early spring?—Yes, for a month or two the rates were high.

7763. And again in 1894?—Yes, for short periods. I dare say you have already had evidence before you that in India we have an active export season, and a slack season, and for a certain number of months the value of money of course rises.

7764. I imagine the point you want to establish is that the closing of the mints has made the rates go up higher than they have ever gone before, and higher than they would have gone except for the closing of the mints?—I did not want to establish that they had gone up higher than they had ever gone before, though I think that is the case. What I wanted to establish was that the stringency had lasted very much longer than it ever did before, and that trade had suffered in consequence.

7765. And is it your position that that is entirely due to the action of the Government, or do you think there are any other circumstances which contributed to it?—My opinion is that practically it is the result of the closing of the mints to the free coinage of silver. My reason for saying that is this. So far as regards capital going for temporary purposes to India, that is, when rates are low here and high in India, I do not think that we have ever had any experience of that in India. They have been high for three months or more—very much higher than in London—and we have never had any experience of money being sent out for those three months, although under the exchange bank arrangements it was perfectly possible for anyone sending out money to arrange with a certain loss to cover the return of that money after it had been employed at a high rate for some months. It is proof to my mind that stringency has been caused partly by the closing of the mints, if not entirely, that while the tightness only lasted in previous years for a short time, in the last few years it has been very much prolonged and intensified.

7766. I understand from your paper, not only that you are dissatisfied with the present state of affairs, but that you dislike the proposals of the Indian Government to remedy that state of affairs?—Following on what I have already said, that the stringency is regarded generally in India as unbearable, if the Government of India for the purpose of removing what they call a redundancy of rupees desire to increase that stringency, I think it will be most disastrous to the trade of India. The proposals of the Government of India will, if given effect to, still further augment money stringency, embarrass and clog the wheels of trade, and thereby prejudice the favourable balance of trade that alone can enable Government to dispose of, annually, their Council bills at or near 1*s.* 4*d.* Secondly, they will fail to promote confidence or attract capital for the development of Indian industries. Thirdly, they will cause a loss in disposing of 10 or 20 crores of rupees as silver, that it is not possible approximately to estimate. And, fourthly, they will increase the difference between the value of the rupee and the value of the silver of which it is composed, thereby further affecting adversely India's competition with countries on a purely silver standard.

7767. Do you consider, in the interest of the trade of India, that a rupee falling in value and cheap silver with open mints would be an advantage to the country?—I think, during the 20 years from 1873 to 1893, when we had with fluctuations steadily falling silver and open mints and a falling exchange, India was exceedingly prosperous.

7768. What is the test of prosperity that you apply?—The exports and imports of the country doubled nearly in those 20 years in value and more than doubled in quantity.

7769. In what respect do you think the trade of India, judged by exports in the first instance, has been prejudically affected since 1893?—That question is a very difficult one to answer specifically. It is hardly susceptible of mathematical demonstration; but if my general principle is right, that exports from India are promoted by a plentiful supply of silver and a low exchange, as I believe they were promoted during these 20 years, then the converse holds true, that stoppage of coinage and a higher artificial exchange must have retarded exports.

7770. Is it a low price of silver or a falling price that you attach importance to?—I think the cheaper India can get her currency the better, and the worse for producers of silver in America and elsewhere; but also there is this disadvantage to India, that if the exchange value of the rupee is higher than the value of silver, then China and other Eastern countries get the benefit of the cheap silver in competition with India.

7771. How low would you like to see the rupee fall for the benefit of Indian trade?—If you were to say to me, "Would you be prepared to advocate the "reopening of the mints if you knew that silver was "going down to the equivalent of 6*d.*"——

7772. You mean till that was the intrinsic value of the rupee?—Yes; I should of course have great hesitation in answering, not because I should be afraid of silver going down to 6*d.* over a great number of years, so long as silver remained the effective standard in India, but because any sudden fall, or a fall over two years, or even three years, would naturally, as India develops slowly, put the Government of India into very serious difficulties in raising revenue to meet their charges.

7773. But would you regard with equanimity a fall to 6*d.*, or anything approaching a fall to 6*d.*, over a long period of years?—I would not fear to face the risk of it if it were spread over a long series of years.

7774. Do you know, supposing such a thing were to happen, what amount of taxation would be involved to enable India to meet her liabilities?—I know it is enormous; but judging from the fact that India was able in the 20 years, from 1873 to 1893, without any great increase of taxation, to pay her way under very difficult circumstances—being in difficulties on a great many sides while exchange fell from 1*s.* 10*d.* to 1*s.* 2*d.*, that is 8*d.*—I think over a long series of years the development of the country would again enable her by various methods, not chiefly by increased taxation, but by the gradual development of all sorts of revenue, to pay the large sums which she would have to pay if the exchange went down even to the neighbourhood of 6*d.*

7775. What is the remedy that you yourself would suggest?—I was not going to suggest any remedy, but may I say this: When you asked me whether I would fear a fall to 6*d.*, my answer might have led you to suppose that I had some apprehension that such a heavy fall is within the bounds of probability, which I think it is not.

7776. I want to know, assuming, as I know you do, that the present state of matters is unsatisfactory, what is the course which you with your experience would like to suggest to the Indian Government?—Speaking to-day as representing the Manchester Chamber of Commerce, and the resolution which you have kindly allowed the Committee to have read to them, I would say that their policy, and what they think it would be best to do, is not to attempt to go any further with artificial experiments, but meantime to let things remain as they are. They believe that within a reasonable period an opportunity will arise, either by the price of silver rising in the market, or by exchange under the present *régime* falling, or partly by both, for the value of silver and the value of exchange to approximate.

7777. What you mean is that the exchange value of the rupee and the intrinsic value of the rupee might

Sir F. F. Adam, C.I.E.

25 July 1898.

in the near future approach nearer one another?—Exactly; and they would then wish to see, and I agree with them, the mints reopened to the free coinage of silver.

7778. Do you think the prospects of the silver market and the silver production in the world hold out any hope of that consummation?—I think so. I think the prospects for the increased demands of silver, especially if India were to reopen the mints, are very great indeed.

7779. Do not let us confuse two things. I thought you said the exchange value and the intrinsic value of the rupee might approach nearer together: I think you must take it on that basis?—What I am going to say would still apply to your question. For instance take the case of China, which is gradually waking up from the sleep of centuries and is going evidently to be opened up in all its provinces by the rivalry of European powers very rapidly. I think China will absorb large quantities of silver; and there are other countries also. Already silver is going to Africa: that will be of course much more slowly, but I think we may expect a very considerable change in the course of, say, the next 15 or 20 years.

7780. Let us assume that this consummation does not come about, and the exchange value and the intrinsic value of the rupee do not begin to approximate, how long would you be prepared to wait under the existing state of affairs?—Personally, I believe India should as soon as possible get on to a sound basis and reopen the mints.

7781. When you say India should get on to a sound basis you mean India should reopen the mints?—Reopen the mints and return to what is commonly called the honest rupee. I should explain here that the Manchester Chamber of Commerce, who unanimously passed the resolution your lordship has read, are not of that opinion. They believe that, without fixing any time—it may be one year or two years—a better opportunity will arise for reopening the mints without the dislocation of trade that would occur if the mints were reopened at present, and they would rather wait for that opportunity than that the Government should go on with further experiments which they believe will only aggravate the present difficulty.

7782. In your paper you tell us also that you have studied the Lindsay scheme; you say it is ingenious and carefully thought out, and is preferable to the Government scheme, but you state that you have some objections to it?—The first objection is that it is wrong in principle, being an artificial scheme, and I do not think that anything artificial in the way of a currency scheme can stand the test of time. Secondly, it might break down in the time of stress or under the operation of a specific attack, and therefore it can never command confidence — confidence being essential to the success of any scheme. Thirdly, it provides for convertibility, but under the management of Government, and its so-called autonomy arrives only with success. Fourthly, the liability of Government under it is indefinite. Fifthly, it also contemplates a restriction and, under certain circumstances, the withdrawal of rupees from circulation. Sixthly, it proposes to keep a reserve of gold in London; that seems to me to be a confession that it is not a suitable currency for India.

7783. Almost everybody, as you heard me suggest to Lord Rothschild, tells us that for the active daily transactions of Indian life, gold is not a suitable currency?—It is not suitable.

7784. What are the precise risks of the scheme breaking down which you refer to in your second objection which you have just read to us?—I could imagine certain circumstances arising with regard to the balance of trade between India and this country, and with regard to the price of gold in India and the price of silver in India as commodities, which working together would create at 1*s.* 3¾*d.* such a demand for bills to be paid out of the reserve with the Bank of England as would cause it rapidly, and almost immediately, to disappear.

7785. Where do you think it would go to?—What might happen would be this. The natives of India, who are always on the watch for a profit, and who understand the changes of the markets and the movement of the exchanges in a very remarkable way, would always be on the alert to find an opportunity when they could buy silver in England and sell it in the bazaars, and draw through the Government of India 1*s.* 3¾*d.*, receiving the money to pay for the silver in London.

7786. But it would not be silver, it would be rupees?—No; simply for the open market, for ornaments, and so on, not for currency purposes.

7787. I do not think Mr. Lindsay contemplates exchanging silver; it is rupees that he contemplates exchanging?—But you were asking me under what circumstances I thought that the reserve could be attacked.

7788. What I asked you was what are the precise risks of the scheme breaking down; in other words, what are the circumstances which would prevent the Indian Government being unable to discharge the specific obligation which it undertakes under Mr. Lindsay's scheme?—I quite understand your question, and what I wanted to show was one of the things that might happen; that although it has nothing to do with Mr. Lindsay's scheme, yet the natives of India seeing a large demand in the market for silver, would sell silver which they would buy in London, and they would pay for it in London by buying drafts on the reserve at the Bank of England, which is five millions to begin with, and that would cause that reserve rapidly to disappear.

7789. But the Indian gentleman you are referring to who would indulge in such a speculation would have to pay rupees in silver?—He pays rupees to the Government, and receives gold bills on London.

7790. How would it help him to do that?—He would make a profit on the silver as a mercantile transaction.

7791. Then if that possible danger is guarded against by, for example, a duty on silver, would you still say that there is a difficulty in that respect?—It is very difficult to know how a duty on silver would operate. India is a very large market for silver, and it is quite possible that not at first, but gradually, the price of silver in London might fall to the extent of the duty or the greater part of it; things might equalise themselves in that way. If the Indian demand were entirely withdrawn by a duty which was intended to be prohibitive, and which actually was prohibitive, I think it is likely that silver might fall to a point which might make it quite unsuitable for currency purposes. But I doubt if this is possible. If the duty were not effectively prohibitive, silver would continue to be imported.

7792. Are there any other circumstances under which you think the Indian Government might be unable to fulfil its obligations?—They might treat gold in exactly the same way. There is a demand for gold entirely outside any purposes which we have in contemplation now—simply as a commodity used for ornaments and for the settlement of speculative transactions in gold, such as the bars which you have seen to-day.

7793. Will you just tell us what would be the operation of that?—Precisely the same as what I have been describing with regard to silver. They would buy the gold in London, pay for it with gold bills on the Treasury reserve in London, and sell it for rupees in the open market in India.

7794. What would they have given for these gold bills?—They would have to pay rupees, of course. They would receive gold bills from the Government, and they would pay into the Indian Treasury rupees, and they would draw away the gold from the reserve in London.

7795. What makes you think that they would go on, to any large extent, paying for their gold bills in rupees?—It is impossible to say to what extent it would go. I am only indicating, in answer to your

question, the different ways in which it might be possible to attack the reserve.

7796. But in addition to the theoretical objection as to the scheme breaking down, I wanted to know what you put before us as to the practical difficulty in the way of the scheme?—I have gone into the scheme thoroughly, and I know what labour and pains have been taken to produce it; but I must confess that I fail to see any promise of lastingness in it.

7797. Have you, or have you not, formed any idea of what number of rupees would be sacrificed by those who possess them in India for the purpose of getting gold?—You have had figures before you showing the very large constant demand for gold for India for other than currency purposes. Where that gold goes to is a question that has always been open to considerable difference of opinion.

7798. Granting the demand, do you contend that the Lindsay scheme would supply gold to the native of India cheaper than he can get it in any other way?—I can imagine, at some times of the year, circumstances arising in connexion with trade movements which would lead to the native of India being able to use the facility offered by Government for drawing gold bills on London to an extent that it is quite impossible to estimate; it might be very large indeed.

7799. Could you not make that a little more definite? Just tell us the precise dangers and circumstances to which you allude?—I have answered your question with regard to the definiteness of it both in regard to silver and gold.

7800. But in answer to me just now you said that you could imagine circumstances under which the native of India would be induced to use the Lindsay scheme for getting this gold. I want to know whether you can tell me any more definitely what those circumstances would be?—What I had in my mind was when the actual balance of trade was not in favour of India. Say in the dull seasons, when exports might be slack and imports fairly active, exchange would tend towards 1*s.* 3¾*d.* till it arrives at 1*s.* 3¾*d.*, when it might become a better rate than the native could get in the open market.

7801. Then is it Mr. Lindsay's scheme, root and branch, that you object to, or to the precise figure of 1*s.* 3¾*d.*?—I do not think myself that any rate you could name would give it that element of assured success that any scheme, to work permanently, must possess. My opinion is that the scheme, as presented to us, is such that there is a possibility of failure, and that that possibility of itself would lead to a want of confidence, and that want of confidence alone would put in operation all the adverse factors, and would lead to a break-down, sooner or later, no matter whether it was fixed at 1*s.* 3¾*d.* or at 1*s.* 3*d.* or any other approximate rate.

7802. As far as I understand, you do not yourself advocate the reopening of the mints. I mean in the circumstances in which we now stand?—Are you asking my personal opinion, or are you asking me as representing the Manchester Chamber of Commerce?

7803. I want your opinion?—My own opinion is this, that we will never have a sound currency in India till either the mints are opened or we are on a gold standard with a gold currency; that a gold standard and a gold currency are not suited for the needs and circumstances of India, and therefore that the sooner we get back to open mints and the free coinage of silver the better. But I am bound to admit that if you did it at once or suddenly it would cause dislocation, and for years the Government of India would be sore set to find an equilibrium for their Budgets. Still, so strongly do I feel the importance of getting back to a sound principle with regard to currency, that I personally would be prepared to face that. But I want to be allowed to emphasise the fact that I am expressing my own opinion. The opinion of the Manchester Chamber of Commerce is that the cons outweigh the pros in that respect, and they advocate a temporizing policy.

7804. Have I missed any point in your paper that you would like to lay stress upon?—I have considered what I understand has been a point of some controversy in regard to the importance of a fixed rupee in contra-distinction to a fluctuating rupee. My experience has been that, so far as regards foreign trade, although a fluctuating rupee ——

7805. Do you mean a fluctuating rupee or a fluctuating exchange?—A fluctuating exchange value of the rupee. Although it is exceedingly inconvenient, it has not diminished, over the average of years, the foreign trade of India. We are accustomed to fluctuations in the prices of cotton, cloth, and freights, and all the factors that go to make up a price fluctuate. Exchange since 1873 has fluctuated much more than it did before; and those actively engaged in business have had to take that into consideration, and it has been an inconvenience—nothing more. That is a point I should like to put before the Committee. Of course, if they got a stable rupee it would be more comfortable no doubt, but I think it might be bought too dearly.

7806. Is there any other point you wish to emphasise?—I wish also to refer to the fact of the low rupee having been a benefit to India from the producing point of view. That is also a point which is greatly controverted. You very often see it stated that exchange means nothing, that it is only a medium; and that if in India exchange falls, the producer cannot possibly be benefited: at whose expense, it is asked, is he benefited? I think that all men who are engaged in the foreign trade of India have found that while the rupee was falling, and prices in gold were falling, producers in this country, and in gold-standard countries, were suffering to such an extent that the landlords had to reduce their rents 40 and 50 per cent., yet, owing to the price of silver falling simultaneously—silver remaining a stable standard in India—and owing to the greater number of rupees that producers therefore received in India they did not suffer during the fall of gold prices; they were prosperous.

7807. Is it your opinion that the number of rupees that the actual wage-earner receives increased, or was it the middleman—the trader—that got the benefit?—I think, if you call the merchant a middleman, he gets no benefit, because he has simply, at a higher or lower rupee, to conduct his business on the factors of prices as they exist, and he has exchange as one of the factors in making his calculations, and the competition and higgling of the market forces him to conduct his business regularly on very small profits. When you come to the middleman in India, the man between the cultivator and the European shipper at the ports, you find his business is conducted in precisely the same way; a low or a high rupee is a very small matter to him unless he is a speculator. I am speaking of the way in which merchants legitimately conduct a mercantile business. I maintain that the money does go into the hands of the cultivator. If you take the ordinary wage-earner—I have no doubt there are gentlemen round this table who will correct me if I am wrong—I remember going into this in India, and I came to the conclusion that among the cultivating classes—and you know that out of the 300,000,000 of the population of India, 60 or 70 per cent. are more or less connected with the soil—of these 70 per cent. one-fourth only are wage-earners in the true sense of the term, and the other three-fourths are actual cultivators of the soil. The cultivators themselves receive the increase and are able to extend their cultivation, and to buy more Manchester goods. The wage earners benefit very slowly, if at all.

7808. Is there any other point that you wish to emphasise?—There is the third point which I make in regard to India being a country that is absolutely dependent upon her exports and the extension of her exports and the success of her exports for paying her way.

7809. But does India differ from any other country in that respect?—I hope not; but in this controversy

Sir F. F. Adam, C.I.E.

25 July 1898.

occasionally I have seen it stated that too much was made of the exports, and the Government of India appear to be of that way of thinking.

7810. Is there any other point you would like to emphasise?—I regarded the closing of the mints in 1893 as a mistake at the time. The necessity was not proved. India was, and had been, prosperous. The foreign trade had year by year increased. Industrial enterprise, largely based on capital supplied by England, had extended. Internal resources had developed. Taxation had only been slightly added to. Loans for other than reproductive works had been comparatively small. Yet Government—notwithstanding famine, war, annexation of Upper Burmah and its settlement, coast defences, new arms of precision, frontier and famine railways, and much unusual and, so to speak, non-recurrent unproductive expenditure—had paid its way, while the exchange value of the rupee was falling from 1*s.* 10½*d.* to 1*s.* 2*d.* Government might safely have braved a further fall. I admit the great apparent direct loss to Government, and the difficulty and perplexity that must have worried finance Ministers in fashioning their Budgets. But these are not unmixed evils, they generate care and economy and a watchfulness over expenditure which, when it is not for reproductive works, cannot be too closely scrutinised. And weighed against the general welfare of the country they are nothing. It is probable that silver, if the mints had not been closed, would not have fallen so low in price, measured in gold, as it has done. But no doubt great economy in expenditure and some additional taxation would have been necessary. Fresh taxation is, and always has been, a difficult and anxious question, but never fraught with the danger some would have us believe. If judiciously done, and all religious prejudices and social customs kept in mind, there is still room. Dissatisfaction and widespread discontent are much more likely to arise from contraction of currency and a strangled trade and from silver bullion held in India not being mintable, than from carefully thought-out methods of raising revenue by fresh taxation. To reopen mints suddenly would cause, under present conditions, great temporary dislocation of trade. My own opinion is that it would be better to face this—short and sharp it would be—and get back to sound principles and an honest rupee by the quickest and directest route. But this is not generally held. It is thought by a temporary policy (no further experiments) an opportunity may come when, by a rise in silver, or a fall in exchange, or by both, a more favourable chance may before very long present itself for reopening the mints to the free coinage of silver without any material upsetting. The prospects of silver point to early extended use in Asia and Africa, and an improvement—slow, perhaps, and very gradual, but sure—in value. And were India to show she had not lost faith in its use as a standard, an example might be set that others would follow. For the present a level in price has been touched that indicates the worst that open mints would have to meet at the start. The only other sound alternative—a gold standard backed by gold—is too costly a remedy. Gold is not suited to the wants of the country, and it could not be forced on the people. It would also not remove the advantage in competition of silver standard countries which India's producers regard as a standing menace.

7811. (*Mr. Campbell.*) You say that the Manchester Chamber of Commerce is in favour of allowing things to remain as they are at present?—Yes, in preference to taking any other course.

7812. Is that because they think that the present scheme of closing the mints has not had a sufficient trial?—No, it is not for that reason; it is for this reason, that the proposals of the Government of India, in their view, seem calculated to make the position worse than at present, and therefore they would not like anything more done in that direction. But at the same time as they are not in favour of opening at once the mints to silver, knowing as they do that if the mints were opened immediately and suddenly there would be a dislocation of trade and inconvenience for some time to the Government, they think it best to remain as we are, and to temporise in the hope that a more favourable opportunity will occur at a future period for reopening the mints.

7813. Of course you are aware that during the last two seasons money has been extremely stringent in India?—Yes.

7814. It is apprehended that next cold weather we shall have a recurrence of that stringency?—I have heard that, and I share the apprehension.

7815. Now, has the Manchester Chamber of Commerce had any method under consideration for meeting that point?—None.

7816. According to them the market must simply fight through it?—The only proposal that I have heard—not from the Manchester Chamber—is that in the meantime the Government of India should buy silver and coin rupees and issue them, taking the profit, but of course it would be useless to put that forward, because it would be directly opposed to the policy of the Government of India, which is to further contract the currency.

7817. But do you not think, apart from that, that there are strong objections to allowing the Government to make a profit out of what you may call coining a dishonest rupee?—I myself think it an unsound policy and objectionable.

7818. Your own idea is to re-open the mints at once?—Yes.

7819. That would of course involve a tremendous dislocation of trade, and a very great fall in exchange?—It would.

7820. Have you any idea to what extent exchange might fall?—I should say that, seeing that when the mints were closed the immediate effect it had was to drive down silver to a much lower point than it had been at before, the immediate effect of reopening would be to raise silver to a certain point, and I think—it is absolutely impossible to speak with any certainty as to what that point might be—but I should anticipate that it would be something over 30*d.*

7821. That would mean a fall of exchange to somewhere about 11*d.* or 1*s.*?—Yes.

7822. Have you yourself any mode by which you would break that fall so as to obviate the inconvenience of such a dislocation of trade?—I cannot say that personally I have any mode, but I know that there are members of the Manchester Chamber of Commerce who think it might be broken by approaching it gradually, that is to say, by beginning under the present Government plan with a low exchange, something like 1*s.* 3*d.* or 1*s.* 2*d.*, or something near it—I think different figures have been mentioned—and waiting for the next step till later.

7823. Perhaps by offering 16 rupees to the sovereign instead of 15?—Yes.

7824. Or 17?—Yes.

7825. That would mitigate the disturbance?—Yes, to some extent.

7826. You were asked with regard to Mr. Lindsay's scheme and the points in which it might possibly break down. Suppose that the balance of trade in India's favour were from any cause to diminish very greatly, the tendency of that would of course be to lower exchange. Suppose exchange tended to go below 1*s.* 3¾*d.*, which Mr. Lindsay puts as his minimum point, might not the Government be forced, instead of selling Council bills below that rate, to go to the Department and take their remittances in that form?—It might be so, but I understood in reading Mr. Lindsay's scheme, that his suggestion is that under no circumstances shall Government stop the sale of Council bills in the ordinary way.

7827. I do not think he went so far as that. One of his points is that he would allow them to go to the Department so as to avoid the inconsistency of Government selling at one price and buying at another?—Then under those circumstances they would certainly be forced to call on the reserve.

7828. And would not that lead to a very serious danger of the scheme breaking down?—That is exactly one of the points that I had in view when Lord Balfour was examining me—that under those circumstances the scheme would probably break down.

7829. I did not think that point was clearly brought out?—It was not clearly brought out, but I had it in my mind when I was endeavouring to answer Lord Balfour's questions.

7830. I think you said your opinion was that a high or a low exchange has a very important influence on trade balances?—Undoubtedly.

7831. And that if Government, in the adoption of whatever scheme they might adopt, fixed upon too high a rate it might injure the export trade?—I think so.

7832. You also consider that the advantage of the fall of exchange goes to the cultivator?—I think the greater part of the advantage of the fall of exchange goes to the cultivator.

7833. We have heard that a fall of exchange is always followed by a fall in the sterling price of produce. Do you agree with that?—That has certainly not been my experience. It is impossible to prove that by statistics. Statistics do not tell you the circumstances that fashioned them; they only tell you in figures what has happened, but I have known gold prices rising, and exchange falling, of a certain commodity, and gold prices of commodities not produced in silver counties have fallen equally with those produced.

7834. Would you say, in all probability, the effect is divided between the two?—I should say that there has been an influence—that it has had some effect over a series of years, but I would not divide it; perhaps you might say 75 to 25, or in that proportion.

7835. That is to say, that the cultivator gets 75 and the sterling buyer would get 25?—That is my view of it, as closely as possible.

7836. (*Mr. Hambro.*) I did not quite appreciate one of your criticisms of Mr. Lindsay's scheme. You know at present India imports bullion to the extent of the bullion which goes into hoard, and I understand you think that a large further quantity would go into hoard, because they would be buying from the Exchange Department bills on London, and so would bring in gold?—No, I cannot have expressed myself quite clearly on that point. We know, of course, that gold is being continually imported, and it either goes into hoards or into ornaments, or disappears in some shape or form, but what I had in my mind was this: Supposing you had a balance of trade in any year, which was not much in favour of India, and simultaneously with that there occurred in India a large demand for gold for hoarding or other purposes, that would increase the run on this reserve through the gold bills issued by the Issue Department, and would, therefore, lead quickly to what Mr. Lindsay himself calls the point of apprehension.

7837. It could not get beyond the amount of the coin that was floating in money, or money would get light?—That is so, but when you are paying gold and receiving rupees, I do not think there are any means of measuring amounts.

7838. Have you any calculation as to how many rupees you could get out of circulation as money got tight?—I do not think anybody can express an opinion as to the number of rupees in India that are now hoarded, and it would be impossible to say to what extent they would come out under certain temptations, both from India and from places beyond our frontier.

7839. Still, if the people there supplied their hoarding instincts in that way, the balance of trade would probably right itself in time, and then exchange would go up again to a point that would bring in bullion if they did not want any more for hoarding?—Quite so, but what I was trying to work out was this, that if people once started an attack which would tend to break down confidence, it would be very difficult to reinstate that confidence, even though the operation might be possible eventually.

7840. You mean confidence on the part of the people?—Without public confidence I do not think it is possible to run successfully any artificial system and hardly with it in India.

7841. You said that a low rate would increase exports. Did you mean by that a falling rate, or a rate that had got low, and was fixed low? Suppose you take the rupee as a token currency, as I suppose if it goes on a gold basis it would become?—Would it?

7842. If you changed your basis to gold, and made gold your standard, I suppose the rupee would become a token coin?—If you made a gold standard, and the rupee became token, you would at once rob India of the advantage she has got from the silver basis.

7843. If we go on a gold basis the rupee becomes a token?—Certainly, if you have a gold currency.

7844. (*Mr. Le Marchant.*) What do you consider was the chief cause which has deterred the public from tendering gold and asking for additional currency recently?—Under the system, of course, exchange really never arrived at the point at which it would pay anyone to send out gold and tender it in exchange for rupees at the Treasury or the Treasury reserve.

7845. Do you think the high rate of interest and the absence of loanable capital was owing to an apprehension that exchange rates would fall as the year went on?—I do not think so. I do not think very much of that question of the absence of loanable capital. I have always divided loanable capital in India into loanable capital which is regularly employed by bankers and merchants in moving backwards and forwards the foreign trade of India, and loanable capital, if it may be called loanable capital, which goes out to India for permanent investment. If you offer an attractive form of permanent investment yielding a high rate of profit, no account is taken at all of the fluctuations of exchange. Thirdly, there is rupee capital in India in the hands of the natives which is used for conducting internal trade. I do not think any of these sources were affected by exchange fears.

7846. How would rates be so high unless there was a relative scarcity of loanable capital?—There is a relative scarcity of currency. The mints were closed five years ago. Immediately after they were closed two millions of silver which had been previously bought by the banks was allowed to be coined. Two millions were liberated by the Government of India, who decided to keep Government paper to that additional amount instead of silver against their note issue. Then a large number of rupees came out from hoards and were exchanged for bar silver. Natives bought bar silver at a low price, and they took the rupees out of hoard and put them into circulation. From these causes the extreme stringency took some years to make itself felt; but I think the stringency has lately been felt, and if things are left as they are it will become increasingly felt. Illicit coinage has—to the extent it exists—been a mitigation.

7847. Why did not the high rate of discount attract more demand for rupee exchange on India for the purpose of using the currency so obtained? Presumably it would have been a paying transaction to send money out in the usual manner of buying exchange and employing the proceeds?—As far as my experience of Indian trade is concerned, and that is spread over 25 or 26 years, under no conditions and no circumstances have I ever known money sent out temporarily for the purpose of getting a high rate of interest for a few months.

7848. Do you think that that may have been due in the past to apprehension as to a subsequent fall of exchange?—I have no doubt it has had some influence, but I do not think it has been a chief or an important influence.

7849. It has been commonly said, has it not, that the exchange banks withdrew a good deal of capital some years ago from India, and preferred to keep it

Sir F. F. Adam, C.I.E.

25 July 1898.

on this side?—That is so. I speak in the presence of a gentleman connected with exchange banking; I am not a director of any exchange bank, but I think that that is so, that they took capital which they held in India and transferred it and kept it in London; but it still remained employed in conducting the foreign trade of the country, whether it was in London or in India.

7850. But only if there was a demand for remittances to India?—Or if there was a demand for moving produce in India; they could draw upon their reserves in London at any time, they could use it in moving the foreign trade, whether the capital was resting in London or resting in India; it was always moving backwards and forwards.

7851. If, on the other hand, rupees are required for moving produce in India, would it not be necessary for banks to send back their capital in some form, in order to get the rupees? Would they not have to part with sterling for a time so as to acquire rupees?—I understand your questions are pointing to this, that in removing their capital from India to England it acted as one of the factors in bringing about stringency.

7852. It was one of the circumstances that pointed in that direction?—I have thought over that, and the opinion that I have arrived at is this, that under a closed mint if a bank had capital which it was employing in India, and wished to transfer to London, it had to buy produce, and it paid out rupees for the produce, and they went into circulation, so that there were no fewer rupees; and as the produce came home they realised it for gold. It was only a transfer account on the part of the bank; it did not lessen the number of rupees under closed mints that were in circulation.

7853. But would not the bank be parting with that amount of currency, and so be in a less favourable position for making advances or discounts?—Not necessarily, because a man who received the bank's rupees might bring them back and deposit them again in the bank.

7854. Would not transactions of that kind tend to weaken the power of the bank for making advances in India?—No, so long as the currency was there and effective, I do not think it would weaken the power of the bank.

7855. Would not the disturbance of the balances of London banks tend to weaken their power of making advances?—It would depend on several factors. If it was for the mere convenience of the banks, I do not think it would have any effect. If the movements caused distrust, that would be another question altogether; but if it is only a matter of banking convenience, which the bank settles itself and nobody knows about outside, I do not see that there need be any disturbance.

7856. Would not the withdrawal of balances from banks in India mean that rupees would pass into circulation generally, and to that extent would pass out of the command of the bank?—It does not follow that they would pass out of the command of the bank. The people who took them from a deposit would pay them away, and the people who got them might bring them in again. Of course, although the rupees are there, if they do not deposit them, the bank has not the use of them, but on the other hand, those outside possessing them may want a smaller amount of accommodation that they might otherwise require to go to the bank for.

7857. On the other hand the bank would be in a weaker position for giving accommodation?—If what I say is correct there would be the less call for accommodation.

7858. But are not rupees the most efficacious when they are in the hands of the banks?—I admit that, of course.

7859. Now, if the policy which I understood you to suggest were adopted, and steps were taken towards gradually opening the mints, what would occur in the intermediate period? Would there not be an expectation of a lower rate of exchange in the future?—It would depend very much on the way in which it was done. Of course if there were an attempt made gradually to reduce the rate, leaving it vague and indefinite as to what time certain steps should be taken, I have no doubt there would be great speculation and uncertainty and unsettlement; but if the rate which it was proposed to adopt were stated, and were made a fixed rate for a certain term of years before any further steps were to be taken, I think the difficulty might be mitigated. But if that point were left vague, I think it would be unfortunate. It is this possibility of uncertainty, unless it is very judiciously done, that leads me to suggest, as my own personal view, that it might be well to go the whole extent at once without any gradations, but I think it might be done so as to minimise the danger of the new lower rate proving ineffectual and unstable.

7860. Though a materially lower rate of exchange might be expected?—Yes. That is possible.

7861. You were speaking of the development of the foreign trade of India from a certain period?—From 1873, which was a period practically of a rapidly falling rate of exchange under open mints.

7862. Do you think the opening of the Suez Canal contributed at all to promote that?—Of course there were many contributories. I may anticipate a further question upon the same point, by saying that railway development of course contributed, and so did the opening of the Suez Canal, and so did many other other things; but my view is that you might have had your railways, and your Suez Canal, and so on, and you would have had nothing like the same result if it had not been for the benefit that India received from cheap silver while gold prices were falling.

7863. Was there not an increase of taxation in the same period concurrently with the fall in silver?—I have looked that up, and I had great difficulty in getting at the exact figures from the public returns; but speaking from memory there were both taxes taken off and taxes put on; for instance, the import duties were taken off, first partly and then entirely, and on the other hand the salt tax was increased a little—not much. Generally I consider that the increase of taxation on balance was small.

7864. With regard to the effect of a rate of exchange; do you think that a rate of, say, for instance, 1*s.* 4*d.*, would lead to a permanently greater amount of imports than a lower rate? I am not speaking of the immediate effect but the permanent effect?—Oh, no; I dispute that most undoubtedly.

7865. I mean imports into India?—The whole groundwork of my position is that the development of imports entirely depends upon the development of exports, and if I am right in my contention that a low rupee and a low exchange have promoted and developed exports, then of course it follows that imports have also by a low rupee been increased. But if you ask me whether a rise of exchange would temporarily promote imports, it would do so, but at the permanent expense I believe of India's foreign trade.

7866. You mean the effect would be to temporarily check the exports?—To check exports and to stimulate imports.

7867. And the stimulus to imports, you think, would be only temporary, whereas the check to exports would be permanent?—There you open up a difficult question, for this reason: You must still keep before you what is thought a most important factor in this involved question, and that is that you have before you the possibility of great development in silver-using countries; and the higher you artificially raise your exchange—I do not say at once, or this year, or next year, but over a series of years—the more advantage you give to those other silver-using countries in competition with India.

7868. Do you think the development of China will be rapid?—I think, from the signs that we now see, that it is going to be rapid. Of course, we know that China is a marvellous country. It has a

most industrious population and splendid resources, and I think that in the course of the next 10 years China will develop more than she has done in the last 200 years—or 800 years for the matter of that.

7869. Have you anything to say about wages in China?—I think in China, as in India, wages move very slowly. The first effect of any development is of course on the price the landlord gets for his produce, and the effect of any great stimulus of production takes a long time to make itself felt by the class you call the wage-earning class.

7870. (*Chairman.*) You say you consider that the present currency in India is not an honest rupee?—That is so.

7871. And that there cannot be an honest system of currency if it is an artificial system?—That is so.

7872. Are you aware that, of the silver currency circulating in the world at the present time, which is estimated at something like 400,000,000*l.*, upwards of three-fourths is token currency with an artificial gold value?—I am aware of that.

7873. Does not that qualify your opinion?—Not as regards India.

7874. I was on the abstract question. Is a token currency which has an artificial gold value a dishonest currency?—No; no more than I call our shilling a dishonest shilling.

7875. (*Mr. Hambro*) It is exchangeable?—If the question of exchange is eliminated altogether, and a currency is maintained at a given value by the credit of the Government, it may be unsound, but it is certainly not dishonest.

7876. (*Sir J. Muir.*) You can only discharge debts by silver up to 2*l.* in this country?—Certainly.

7877. (*Chairman.*) Of course a shilling in this country is not worth 6*d.*, but for all practical purposes it is worth the twentieth part of a pound. That is an artificial value?—It is an artificial value maintained by the credit of the Government.

7878. (*Sir J. Muir.*) But it is only legal tender up to 2*l.*?—That is so.

7879. (*Chairman.*) You said that the landlords of this country had had to reduce their rents by 40 or 50 per cent. owing to the currency depreciation?—No, owing to the fall in gold prices.

7880. Do you think that that was the cause?—I think so.

7881. You do not think that free trade had any effect upon it?—I think free trade had an effect in giving England the full benefit of low gold prices.

7882. And you consider that the great depreciation in the value of land in this country arises from the fall in gold prices?—Yes. May I just add this? I think the fall in gold prices has been brought about by the estension of production all over the world, and cheapening of methods of production and means of communication, and of course England has naturally got the advantage of that under her free trade policy.

7883. (*Mr. Holland.*) You are interested, I think, in imports into India. We have had the advantage of a good many witnesses here who are interested in exports from India, and their position is quite intelligible. They say that low exchange encourages exports, but you have explained that the same movement of exchange, which encourages exports, discourages imports, and notwithstanding that, you think that ultimately it would be an advantage to your Indian imports rather than a disadvantage?—That is my view.

7884. You think it is a good policy to encourage exports?—No doubt.

7885. We have had it in evidence from a previous witness that Council bills themselves create exports. Do you agree in that view?—No, I cannot imagine it. I have heard of a hen laying an egg, but I never heard of an egg laying a hen.

7886. You do not agree that a Council bill is virtually an order to export?—No.

7887. You referred, I understood, with approval to the time when exchange was lower, and still falling; but was not there a good deal of dissatisfaction in Manchester at that time?—You are referring probably to the time when the controversy in Manchester was raging round the English question of currency. There is no doubt that there was one party to that controversy who did use that argument—the falling and fluctuating of exchange as lessening and making more difficult the conduct of trade with India; but, personally, I and those associated with me used the very same argument that I am using now to oppose that reasoning.

7888. Then, although there was dissatisfaction in Lancashire, it was not universal?—By no means.

7889. Is opinion in Manchester divided now at all upon this subject?—Apparently not, if we may judge from the resolution which you heard read.

7890. Now is it the fact that the Indian Government are really themselves very large landowners?—Very large landowners.

7891. And to that extent their interests are probably identical with the interests of the Indian producers?—That is the view that I hold.

7892. It is contended by some, and probably you will agree with it, that a policy which is in the interests of the producer in India cannot be contrary to the true interests of the Government of India. Do you agree with that?—That is the view I have always taken.

7893. Of course you are aware that a gap in Indian finance would be created by a fall of exchange. I understand that you propose to fill that gap by an increase of taxation?—If it be necessary.

7894. Do you think cotton would stand a chance of escaping if there were any increase of taxation?—That is a matter for the decision of the Government of India. You are now asking me a question my reply to which will be watched very closely in Lancashire. You know there was a very great commotion in Manchester over the re-imposition of the import duties. That arose I think, mainly, if not altogether, from the fact that Manchester had not realised that it is possible to put on import duties without interfering with free trade, to which they are intensely devoted; but now I think they know better, and see that if by excise duties protection is eliminated, and duties imposed for revenue purposes only, all interference with free trade principles is removed.

7895. Do you put that forward as the opinion of the Manchester Chamber of Commerce?—I do not say that there would not be objections, but I do not think you would have such hot objections expressed as upon the occasion which is no doubt within your own memory.

7896. The resolution of the Manchester Chamber of Commerce seems to imply objection to a gold standard with a gold currency. Would the Manchester Chamber equally object to a gold standard without a gold currency?—I think the opinion of the Manchester Chamber of Commerce is that the thing is impossible.

7897. Theoretically I suppose you are in favour of a gold standard, but you maintain that there are insuperable difficulties in the way of carrying it out?—I think it would be very difficult to keep the gold, and that it is unsuitable, and there is also another objection, that you would leave an advantage to silver-using countries. If it could be done I admit that it is sound in principle. I mean, of course, a gold standard, backed by gold.

7898. We have had it in evidence that the closure of the mints has had no injurious effects on trade. Do you agree with that?—No, I think it has had distinctly an injurious effect on trade. I think the movement in the interior of India both of imports and exports has been very seriously interfered with. That is my own experience.

7899. Do you think at the present time there are fewer rupees than are required for the purposes of trade?—I think so. I should like to see trade allowed to regulate its own demand.

Sir F. F. Adam, C.J.

25 July 1898.

7900. I do not know if you fully explained your views as to what are the causes of the present stringency of the money market in India?—I believe myself, putting aside minor causes, that the chief and great cause is the closing of the mints to the free coinage of silver.

7901. We have often been told that there would be no currency question if there were no home charges, but I suppose those home charges result very largely from outlay on reproductive works?—Very largely indeed.

7902. You have yourself strongly advocated such outlay, I think?—Yes.

7903. And you think it is justified?—Yes; I think myself India would never have been developed unless England had taken the lead in constructing reproductive works in India with money borrowed in this country.

7904. (*Sir A. Dent.*) Nearly all the questions I had intended to ask you have been anticipated, but I would like to ask you this. You said that everything fluctuates—you said produce and freight fluctuate, and then I understood you to say, "and exchange fluctuates as "well, which is inconvenient," as much as to say that exchange was a minor matter; Is that the impression you wanted to give?—I wanted to give the impression that the fluctuation of exchange, as far as it affected the conduct of business, was unimportant in itself, although inconvenient; that it did not really affect the sum total of transactions in any year because the necessity for taking risks is removed by the facilities offered by the exchange banks.

7905. (*Sir C. Crosthwaite.*) You hold that low exchange promotes exports?—Yes.

7906. Does a large sale of Council bills tend to lower exchange?—That would depend altogether upon the existing balance of trade. If exports at the time of a large sale were very large they would be very easily disposed of without lowering exchange.

7907. I am supposing that a large sale is necessary every year, regardless of the state of the market; would that tend to bring down exchange?—It tends to bring down exchange under certain conditions.

7908. If the mints were reopened the Secretary of State would have to sell many more bills?—Yes, possibly, though not necessarily.

7909. Therefore the probability is that the large sales would bring down exchange?—If the balance of trade were unfavourable that would be so.

7910. Then if your position is correct, that the low exchange tends to increase the exports, so far, and in such conditions as I have mentioned, the sale of the Secretary of State's bills might tend to increase the exports?—It would tend to promote exports by lowering exchange till you reached the silver point, whatever that point was. Silver might go up to meet it or it might go down to meet silver, but while the sale of Council bills was being carried out it would not create exports, but by causing the rupee to fall and therefore to get cheap silver into the country it would tend to the development of the powers of producers.

7911. You said that the low rupee benefited the cultivator; I suppose you mean by giving them better rupee prices?—Yes, during the fall of gold prices.

7912. During the same period that you said this was taking place, from 1873 to 1893, you also said that gold prices were falling?—Yes.

7913. Would not that tend to counteract the effect of the fall of silver in giving the cultivator high prices?—It operated exactly in this way, that had it not been for the contemporaneous fall of silver along with gold prices, the cultivator would have been in the same position as the cultivator in this country, and he would not have been able to carry on without a reduction of rent.

7914. Therefore the benefit you mean was a negative benefit to him; there was no positive benefit?—It was negative in a sense; but I should think from a business point of view it was exceedingly positive.

7915. What I mean is, it saved him from loss, but it did not actually give him gain?—That is so.

7916. In your experience, have prices risen in India?—No, I should say not. Of course there have been rises in certain districts and temporary rises from different transient causes, but speaking over a series of years, and taking all commodities, I do not think there has been a rise.

7917. Have wages risen?—Not so much as you would expect except in the chief towns. I should say that the price of agricultural labour has not risen very much.

7918. (*Sir D. Barbour.*) You said that the expectations of the Government of India in closing the mints had not been realised?—Yes.

7919. What were those expectations that have not been realised?—It was expected that exchange would rise to 1*s.* 4*d.* and remain there, and that in a certain time gold would be presented in India shipped from this country to pay for the balance of trade; then that the Treasury would pay out 15 rupees per sovereign and replace the reserve with gold instead of silver; and then when the whole of that reserve had become gold and the sovereign was still being brought from this country to pay for the favourable balance of trade the Indian Government would buy silver and coin it, and with the rupees it coined it would pay for the sovereigns and so make the gold standard effective. That I gathered was the policy and plan of the Indian Government judging from the published records.

7920. Taking the question of the rise to 1*s.* 4*d.*, did the Government of India expect that to be realised immediately?—I do not say that they expected it to be raised in a week or a month, but I gathered from the records that it was expected to come in a year.

7921. I will read to you this passage from a speech that I made in the Viceroy's Council on the 26th June 1893 when the Bill was introduced: "It may be that "the gold standard can be made effective from the "first, though it will not be secure until there is a "considerable amount of gold in our treasuries and "banks. Or it may be that the making of the gold "standard effective, and the establishment of it on a "secure basis, will involve a long and arduous struggle, "and necessitate heavy sacrifices. Time alone can "show which view is correct." Having heard that, do you still say that the Government of India expected that the rise would be immediate?—If that is a correct report of what you said, of which I have not the slightest doubt, certainly your opinion at that time was that there were two views; and if you spoke the opinion of the Government of India, they held the same. But many opinions were spoken—authoritative or not—at that time.

7922. Did the Government of India ever fix any time within which the gold standard would be made effective, or within which they thought it would be made effective?—They never did as far as my recollection goes. I have only the impression that I gathered from various despatches that I read.

7923. I would like to read you another passage. This is a passage from an answer to a question put in Council on the 31st August 1893. "The object of "providing for the issue of rupees in exchange for "gold at 16*d.* the rupee was to prevent any great "and sudden rise of exchange, and the Government did "not undertake either to establish 16*d.* per rupee as "the permanent ratio of exchange between gold and "the rupee, or to establish any other permanent ratio "immediately or within any specified time." Do not those words show that the Government expressly avoided fixing any time within which the gold standard might be made effective?—I do not say that they specifically named a date, but the general impression was undoubtedly that they expected it to come, as I have already said, within a year.

7924. I suppose you would call this the slack season in India?—Yes.

7925. You know that the exchange is very nearly 1*s.* 4*d.* at present?—1*s.* 3⅞*d.*

7926. Do you apprehend that there is any probability of a serious fall again in exchange?—Do you mean immediately?

7927. In the course of the next two or three years?—Oh, yes, I think it is quite possible.

7928. Have you been rather surprised at its keeping up to 1*s.* 3⅞*d.* at the present time?—Not at all.

7929. What are the special causes that have been operating to keep it?—Two special causes have been operating; imports have been very seriously interfered with on account of the state of trade in Calcutta, owing to plague scare; and this has been aggravated to some extent by dear money. Then also in Karachi and Bombay there has been serious interference with imports by reason of lingering plague prevalence.

7930. I think you said that a gold standard and a gold currency are not well suited to India?—That is my opinion.

7931. Do you mean that it is not possible to establish a gold standard and a gold currency, or that it would not be a good measure even if it were possible?—I regard the gold standard with the gold currency as a sound principle, but it is very difficult to estimate how much gold you would require to start with. I have heard it stated in this room to-day, that you would require 20 or 30 millions, but if you are going to have a gold standard which will enable you not only to provide for convertibility, but also to provide for an unfavourable balance of trade at any time, I think, myself, it might possibly be a very much larger sum at the beginning, and if I recollect rightly, you have yourself once estimated it at about 70,000,000*l.*

7932. Putting aside the question whether or not it is practicable to establish a gold standard cheaply or readily, if you had a gold standard, would it be a good thing?—If you had a gold standard and an effective currency, putting aside all the difficulties, that is to say, the initial expense, the amount that would go into hoards, necessitating annual replenishment by the Government, if you put all that aside the only drawback is, as I have already said, that you leave the advantage as between India and China in the hands of China; and in my opinion it is not suited to the circumstances of the country.

7933. Then the drawbacks are that it may be difficult and expensive to establish it, and that, if it be established, you think nations that have a purely silver standard will have some advantage?—That is it, and unsuitability.

7934. You said you thought that India had an advantage from the silver standard between 1873 and 1893, as compared with countries with a gold standard, and at one time you said you thought that that was because the Indian prices remained more steady in silver?—Yes.

7935. Do you think she had any advantage in foreign trade? What you said about prices remaining more steady under silver would apply to all prices in India, but over and above that, do you think she had any advantage in her foreign trade?—You mean looking at it from the point of view of both imports and exports?

7936. Take first imports, and secondly exports?—I think so. I think by being able to get for her surplus produce a greater price in silver, and those silver rupees going as far as ever, it kept her in the position to pay a higher price for her imports and purchase more than she would otherwise have been able to do. I am always keeping before me the fact that, unless exports prosper, you could not expect imports to prosper.

7937. You think, then, that the fall in exchange stimulated exports, and stimulated the imports too?—Yes, in the manner I have tried to explain.

7938. Do you think that a rise in exchange during that time, if it had occurred, would have had the opposite effect?—I think a rise in exchange would certainly have robbed the cultivators and producers of India of a great deal of the benefit that they got, and would have made it more difficult for them to pay their rents to the Government.

7939. You are speaking of the foreign trade?—I am still speaking of the foreign trade.

7940. If exchange had risen, would the imports and the exports have been the same?—If exchange had risen over a series of years, I think the exports would distinctly have been checked.

7941. And therefore the imports?—Just so.

7942. So that the fall in exchange stimulated both exports and imports—that is the whole foreign trade?—Yes, as exports increased so imports increased.

7943. And a rise in exchange would have checked exports and therefore checked imports, and the two make up the whole foreign trade?—No, you have something more than that. Naturally you must have a balance between imports and exports, but the foreign trade on the one hand is made up of exports, and on the other hand, in considering imports, you have, first, commodities, and then you have to take into account the amount of Council bills and private remittances.

7944. You want to include the Council bills in the trade?—In a manner it is impossible to leave them out, and there is always the unknown quantity of private remittances.

7945. I would like to put that aside and take the trade merely—the exchange between commodities, including gold and silver. I have found a difficulty in holding, and I have never seen it explained to my satisfaction, that a fall in exchange stimulates the international trade between two countries, and that a rise in exchange has the opposite effect; that is looking at it from the point of view of one country, but if you look at it from the point of view of the other country a fall of exchange becomes a rise of exchange. A fall in the Indian exchange is a rise in the English exchange, and yet the opposite effect is ascribed to the same thing according to the side from which you look at it.—I also have been exceedingly puzzled in trying to make out the complexities of the problem, but if you once go out to India and live with the producers of any commodity in any part of India, whether you take coffee, cotton, tea, or any other article, and ask them whether they have not benefited by a fall in exchange ——

7946. I am merely telling you the difficulty that has occurred to me and to which I have never seen any answer—The difficulty has often occurred to me. I do not think I can think over it more than I have done. It is more or less a conundrum that has to be answered in this case from the Indian point of view.

7947. Now, as regards confidence being necessary to the establishment of a gold standard. If you pursued a system in itself unsound for the establishment of a gold standard, the fact that there was confidence in that unsound scheme would not enable you to establish a gold standard?—Certainly not; but I think you pay a poor compliment to those who have to express confidence in the system.

7948. Some people have confidence in an unsound system. It has happened before and it might happen again. We have seen men of decided eminence declare in favour of a system, and men of almost equal eminence declare against it?—I must confess myself that when I hear the word "scheme" or system mentioned in regard to currency matters I begin to feel a little frightened.

7949. On the other hand, if you had a sound scheme it might succeed, although there was no confidence in it?—If you persevered in it you would win confidence.

7950. All I mean is that confidence of itself is not what will establish a gold standard. If you have a sound scheme you can establish a gold standard, although there may not be confidence in the scheme?—Just so, and in the same way, want of confidence in an unsound scheme will probably make it break down all the sooner.

7951. Confidence alone will not make it sound?—No.

Sir F. F. Adam, C.I.E.

25 July 1898.

7952. Now as regards the high rate of discount in India. Do you think it is due to want of loanable capital or want of currency?—I have come to the conclusion that it is want of currency.

7953. You know there are a great many rupees in India that are not available as loanable capital?—That is so. Every man in India is his own banker practically and keeps his rupees hidden away.

7954. If 5 crores that are hoarded in the interior could be got at and deposited in the presidency banks, that would increase the available capital, although it would not increase the currency?—Undoubtedly, because the rupees which are now practically non-existent, would become available.

7955. They are not non-existent. They are rupees which are in existence, but are not available?—They are non-existent for all practical purposes. They are not available—they are not part of the effective currency.

7956. Now you said that some of the exchange banks had withdrawn money from India?—Yes.

7957. Do you think some private depositors have taken their money out from India also?—I think a number of people who had savings there and were waiting for 1*s.* 4*d.* sent their money home to invest it in this country. But that sort of thing has been going on, I think, more or less ever since I went to India 25 years ago.

7958. I think I heard you say that a Council bill was not an order for export?—No, not exactly an order for export. As I understood the question, it was that a Council bill did not create an export.

7959. Suppose the Secretary of State made up his mind, or Parliament ordered him, to draw 10 millions sterling in every year more than he had drawn before, that would put down the exchange?—Yes, under certain conditions.

7960. That would increase exports?—A lower exchange would stimulate exports of course.

7961. In fact, that 10 millions could not be paid in any other way, practically, than by increasing the exports?—I see exactly your point, but the way you are putting it, I think, is tending a little to the confusion of two separate issues. Naturally as Council bills increase and have to be drawn to that extent, as they have to be paid by exports, you must increase your exports, and if that leads to a fall of exchange the chances are that those exports will be forthcoming; but suppose you insisted on drawing an increased number of Council bills, no matter what the circumstances were, and suppose it was in a year such as the year which we have lately passed through, with no surplus production—a famine year—you could not create produce by Council bills. You would have to find some other means to balance it; you could not create produce because you drew Council bills.

7962. You might check imports?—But that would be after the mischief was done, when you could not get produce to ship.

7963. It is not my statement that a Council bill is an order for export, but it appears to me that money which the Secretary of State has to find, can only be found by India if there is a sufficient surplus of exports over imports?—That is so, undoubtedly.

7964. There is no other possible way?—Just so.

7965. Therefore, if the Secretary of State has more money to find, the surplus must increase?—The surplus must increase and does increase under ordinary circumstances. I was only wanting to avoid what appeared to me the possibility of confusion by using the word "create." If the exports did not exist effectively in the country, you could not create them by drawing Council bills.

7966. In point of fact, when the exchange fell sufficiently low, gold was exported to some extent from India?—Yes, the holders of gold, the native bankers, were very clever; they thought at one time exchange was going to recover, and therefore they sold out their gold, and for that year the export was larger than the import. It was simply a speculation.

7967. And since exchange rose they have begun to import again?—Yes.

7968. Now as regards trade having suffered by the closing of the mints. It has suffered, no doubt, from the high rate of discount which you ascribe to the closing of the mints, and I entirely agree with you to that extent, but has trade suffered in any other way?—I would answer that question in this way, that the mischief that would be brought about by the closing of the mints, if the present policy were persevered in, is only now beginning to show itself, and it will be years before it develops to its full extent. It will take a long time really before the mischief in India, if the present policy is persevered in, will show itself in the statistical returns.

7969. I was not thinking so much of the statistical returns, because, of course, the famine has caused a falling off, but, apart from the high rate of discount, in what other respect is trade likely to suffer?—I think I have already gone over that ground, first in regard to the advantage that silver-using countries will have, which, of course, I think will increase very much as years go by.

7970. Anything else?—Those are the two chief dangers. The rupee has been high for such a short time, and such an unfortunate time for India, that I would not base any argument upon that.

7971. If prices, and wages generally, rose in silver-using countries, the countries which have a silver standard would lose that advantage?—If silver rose to the ratio fixed in India, they would have no advantage.

7972. But if silver prices rose proportionately to the fall in silver in silver-using countries, they would lose the advantage?—You mean in wages, yes. It would diminish. I do not say that it would disappear altogether; I do not believe myself that that is possible, but it would diminish.

7973. Theoretically, it would, if everything rose in proportion?—Theoretically. That is the theory; I have never been able to see it practically tested satisfactorily in any experience of mine.

7974. I know there is a difference of opinion upon the question between men, on both sides, very capable of forming an opinion, but if wages were to rise proportionately, the advantage would be swept away?—No doubt.

7975. (*Mr. Hambro.*) You said you had carefully considered the question of loanable capital and currency. Can you separate in any way loanable capital in any one spot from the currency available in that spot?—I cannot myself.

7976. Could you get any more capital loanable in a particular spot without bringing more currency to that spot?—That ought to be so wherever you have a mint that will take the bullion that you bring to it, but it is impossible in India at the present moment because the mints are closed, and therefore you cannot send bullion and transfer it into currency.

(*Sir. F. Mowatt.*) When you say currency you are referring to rupees?

(*Mr. Hambro.*) Yes.

(*Sir F. Mowatt.*) Not notes?

(*Mr. Hambro.*) Well, notes are rupees, because they can be exchanged for rupees.

7977. (*Sir J. Muir.*) I understood you to say that you consider that those desiring the benefit of India should do all they can to foster and encourage exports?—Certainly.

7978. And in your individual opinion you think it desirable that the mints should be re-opened under proper safeguards?—I think the sooner you get to open mints the better it will be for India.

7979. You were asked if you could suggest any such safeguards. I think it behoves those who hold your opinion (with which I do not disagree at all) to suggest some such safeguards. Perhaps your attention has not been very much directed to that subject?—I myself do not see if you are going to have the principle of open mints, that you can provide any safeguards, for safeguards themselves partake of the

nature of an artifice, and therefore are unsatisfactory. I have already said that the proposal to arrive by gradation at open mints has something to be said for it. I have also had it suggested to me that if it were possible to approach America, leaving England entirely out of it, and propose that they should open their mints at a low ratio the (equivalent of 42*d.*) on condition that India should open her mints, it would be a useful lesson, and it could not be any disadvantage to England and would benefit India.

7980. You say it would be a useful lesson?—Yes; we should see how America would get on with her experiment in bimetallism. I have heard that suggested several times, and, if practicable, it certainly is deserving of consideration. Whether there is any practicability in it I do not know. It does not preclude what, to my mind, is the most important thing, and that is, arriving by some stage or other at the opening of the mints for the free coinage of silver. In fact I believe it would get over many difficulties, and might be a final solution.

7981. Mr. Lindsay's scheme has been fully explained to us, and we have also had the Government of India's scheme, and Mr. Probyn's scheme. Now we had before us an eminent banker, Mr. Raphael. He has a scheme which was briefly explained to us by Mr. Robert Steel. I will just explain to you what it is, because it seems to me there is something in it. I do not approve of it altogether, but I think there are the bones out of which something might be evolved. Mr. Steel explained Mr. Raphael's scheme in this way: "You may announce that the mints are opened "to silver to be coined as it is paid in, in order of "delivery; that you will coin two lakhs of rupees a "day and that you will pay for it in Treasury drafts "at 10 days, that is to say, that the first two lakhs of "silver presented at the mint will be paid for by "draughts at 10 days sights, the second two lakhs "will be paid for by drafts at 11 days sight, the third "two lakhs by drafts at 12 days sight, and so on. In "that case a large amount of silver no doubt will be "tendered at once in India, and probably enough to "keep the mints going for 18 months. It would not "be possible for people to send out silver from "England to meet that demand without incurring the "prospect of considerable loss, that is to say, they "would only be paid for it 18 months later, and they "would have to discount the Treasury drafts. Now, "in discounting the Treasury drafts, the discounter "would naturally take into account the fall in the "rupee value at the time he has paid his money, and "he would therefore charge a higher rate of discount, "I should think not less than 12 or 14 per cent. per "annum. The consequence is it would not pay to "send out silver from England to India for coinage "without allowing a considerable discount, and the "exchange would not fall very rapidly. I do not "think the exchange would fall very much at all "under that arrangement." As I say, I think the bones of some scheme are there. I think he proposed too much when he said two lakhs of rupees a day. Suppose we were to begin with one lakh, or something of that kind; do you see anything of a basis here whereby we might reopen the mints without running the risk of a very sudden collapse in exchange?—I would not like to give an opinion hastily in a matter of that sort, especially as that suggestion comes from such a distinguished authority, but I do not think it would work out as its author anticipates. If it were known that open mints were coining, exchange would be apt to tend quickly towards the silver price.

7982. Perhaps when you get the proof of your evidence you will fill in whatever you desire to say upon that scheme?—Very well.

7983. If I have understood you aright, you have said that while some years ago Manchester objected strongly to the import duties, that objection had not reference so much to revenue raised for Government purposes as to the argument about Protection?—What I wished to say was this, that when import duties were first mooted, Lancashire got the idea that it was an interference with free trade, to which she is devotedly attached. You know that that is one of the principles that Lancashire people feel most strongly about. But what I said was that Manchester had gradually discovered, as the controversy has proceeded that really the imposition of import duties does not interfere with the principle of Free Trade at all, if you put on a duty for revenue purposes only, and eliminate all elements of protection. What I wished to convey was that according to my view the feeling in Lancashire would not be strong upon the subject now, so long as there is no question of Protection.

7984. That is what I understood generally, but I wanted to elicit it from you?—May I just say here that I have often heard Indian import duties objected to on the ground that they do not pay the cost of collection. In the case of increased duties no objection of that kind applies, because the cost to the Custom House of the collection would not be increased, it being a fixed charge, while the per-centage of expense would be diminished.

7985. Charging an Excise duty on the Bombay mills?—Yes, you must not allow me to leave you gentlemen in this room with the idea, and I would not like Lancashire to get the impression, that I have advocated increased duties. I have only tried to answer your question as to the present state of feeling in Lancashire.

7986. What I am trying to feel my way to is this. It has been stated that there will be great difficulty in the Government of India raising the necessary funds to balance the Budget. My opinion is that if we set about the thing carefully some means might be devised?—I think myself that the best means, if it ever came to be a question of taxation, would be to appoint a carefully selected Commission or Committee of Europeans (non-officials and officials) and natives, and let them go thoroughly into the question in a way that it has not been gone into at all up to this point.

7987. The idea has been suggested that there might be an export duty charged on all jute shipped from Calcutta, and at the same time a duty on all jute produced by the jute mills in Calcutta, which would produce a very substantial sum. Those are two sources of income—Manchester goods and an Excise duty in Bombay; a duty on the raw jute and an Excise duty on the jute mills in Calcutta would bring in a substantial sum. Then again, coal, as you know, has now become a large article in India, and again, iron; that is to say rough iron—pig-iron; then again, salt has been referred to?—Be careful about salt.

7988. We have had before us Mr. Robert Steel, who understands the thing pretty thoroughly; and he says, at any rate, if the native pays for his salt he only pays 4*d.* a year. Then, we can assess up to 3 rupees, and now we only assess up to 2 rupees 8 annas; the difference 2 rupees 8 annas and 3 rupees would amount to a large sum, perhaps 9 crores or so.

(*Mr. O'Conor.*) Oh, no, perhaps 1 crore; not more. We only get 6 crores now, out of the 2 rupees 8 annas assessment.

7989. (*Sir J. Muir.*) However, that is another thing that we could fall back upon?—But I warn you that salt is a burning question among the natives of India, because it is a sentimental question. The native Indian is very averse to any increase in the salt tax, the feeling being that it falls on the poorest classes, and that they can ill afford any extra taxation.

7990. Do you know anything of the settlements; the land was settled on the basis of 30 years, and some of the settlements are falling in from time to time?—Some of them; some of them have been renewed, I think, not very long ago.

7991. As these settlements fall in the period of settlement might be reduced from 30 years to 10 years?—I think it is quite within the province of the Government of India to consider that matter. They know all the circumstances, and what they can safely do.

Sir F. F Adam, C.I.E.

25 July 1898.

7992. But that is another source of income?—Yes.

7993. (*Sir F. Mowatt.*) I understood you to say that you thought the silver standard of China has given an immense advantage in competing with India for external trade?—I rather intended to convey this meaning, that we had not had time yet to see China reap the advantage of the silver standard, but that it will inevitably come within a few years. That is my opinion.

7994. That would be equally true, of course, with regard to Chinese competition with all gold standard countries?—Yes.

7995. Therefore India is no worse off than the various gold standard countries in the world in competing with China?—Except that she is doing a direct competition in many articles which both can grow, being Oriental countries, and that other gold standard countries, European countries, cannot grow.

7996. (*Sir C. Crosthwaite.*) I understand that in your opinion the low exchange value of the rupee did not reduce the sterling value of produce in gold countries?—I think I said in answer to Mr. Campbell that it had some influence. I admit it had an influence.

The witness withdrew.

Adjourned.

EIGHTEENTH DAY.

Tuesday, July 26th, 1898.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P. (in the Chair).

The LORD BALFOUR OF BURLEIGH.	SIR ALFRED DENT, K.C.M.G.
SIR JOHN MUIR, Bart.	MR. ROBERT CAMPBELL.
SIR FRANCIS MOWATT, K.C.B.	MR. EVERARD HAMBRO.
SIR DAVID BARBOUR, K.C.S.I.	MR. W. H. HOLLAND.
SIR CHARLES CROSTHWAITE, K.C.S.I.	MR. F. C. LE MARCHANT.

MR. ROBERT CHALMERS, *Secretary*.

Mr. H. Coke.

26 July 1898.

Mr. HENRY COKE called and examined.

7997. (*Chairman.*) Your place of business is 12, Leadenhall Street, and you are the representative of Messrs. David Sassoon & Co.?—Yes.

7998. For how many years have they been engaged in the Indian trade?—They have been in Bombay for 60 or 70 years.

7999. How long have you been connected with them?—Thirty years.

8000. I believe you are intimately acquainted both with Indian currency and Indian commerce and Indian finance?—I have had a great deal of experience.

8001. Were you in favour of closing the mints or were you opposed to closing the mints in 1893?—I was in favour of closing the mints, and I gave evidence before Lord Herschell's committee to that effect.

8002. Will you give us shortly the grounds upon which you arrived at that opinion?—In 1876 I urged upon the India Office, through Sir Louis Mallet, the expediency of closing the mints, I have a letter in my possession at the present time from Sir Louis Mallet, saying that he agreed with me, that under the circumstances it would be quite justifiable to take that course, but I ought to be aware that there were a great many authorities both in and out of Parliament who were strongly opposed to such a course. For many years I was connected with the Bimetallic League, but when I saw that bimetallism was impossible, I turned my attention to the closing of the mints, and urged this course upon all persons connected with, or having any interest in the Government of India.

8003. May I ask whether you have any statistics to support that view?—I have not.

8004. Do I understand that Sir Louis Mallet expressed an opinion in favour of the closing of the mints?—Yes, here is the letter:

India Office,
September 15, 1876.

DEAR SIR,

I AM much obliged for your letter and can only say that your views are almost identical with my own on this question.

I believe that the result will be a diminution of imports to an extent sufficient to enable the Home Government to draw its 20 millions out of the excess of exports, and a general contraction of the foreign trade of India.

I do not see how the exchange can right itself under present circumstances. As to stopping coinage in India—which I agree with you in thinking quite justifiable, if not necessary—you are aware that all the great authorities, both in and out of Parliament, are bitterly opposed to it.

Faithfully yours,
(Signed) L. MALLET.

H. Coke, Esq.

8005. In your opinion what has been the effect upon the export trade of India of the closing of the mints?—I think it has had little effect one way or the other. The export trade has continued very much the same as it was before, and my opinion is that, if the export trade of India could be conducted with exchange at 2*s.* for the rupee, there is no reason why it should not continue with an exchange of 1*s.* 6*d.* or 1*s.* 4*d.* the rupee. I fail to see that exports have been affected in any way by this fall of exchange.

8006. You do not think the exports have diminished?—I think not.

8007. Have you any knowledge of its effect upon the internal trade of India?—I believe that has not been affected in the slightest degree.

8008. Have you any knowledge of the recent stringency in the money market in India?—I have.

8009. Will you tell us your views as to that?—The effect of closing the mints has been that every year the redundancy of currency which existed in 1893 has been curtailed by a slow process. In 1893, when the closing of the mints took place, the whole of the crop of that year had been already paid for and disposed of, so that the closing of the mints had no immediate effect upon exchange. In 1894 there was a very considerable redundancy of currency to be worked off. A portion of it went up country and sank into the black soil of India; that is, it went to pay the wages of the labourers who had grown the crop, and it became distributed among people in the interior. In 1895 a further effect upon the currency took place by the disappearance of the redundancy. Then we came to the famine year, when the reduction was less. Subsequently the export trade resumed its normal proportions and the stringency of money was severely felt. Exchange rose to 1*s.* 4*d.* the rupee. People who had kept back their remittances waiting for the expected rise took the opportunity to remit, and this added to the demand for sterling bills. In my opinion the stringency will increase every year.

8010. (*Sir F. Mowatt.*) You say, will increase, not continue?—Will increase; and I suppose that next year if there is an ordinary crop, the stringency will be greater, and there will be a still greater difficulty in getting money in India to pay for the crop of the year.

8011. (*Chairman.*) How is that affected by the Government notification that for gold at the rate of 1*s.* 4*d.* the rupee, they will give rupees?—I think the gold must go to India.

8012. To get the rupees?—To get the rupees. It is the only means of increasing the currency of the country. The currency must be elastic.

8013. Is it not the fact that under the last notification of the Indian Government, upon the payment in London of gold, rupees can be coined in India if the Government wish to coin them, and put into currency there?—Yes, but people will not pay gold into the Bank of England in return for rupees in India at 1*s.* $4\frac{5}{32}$*d.*, when there is a risk of the exchage falling to 1*s.* 3*d.* on the cessation of exports. As a matter of fact, forward exchange at one time this season was quoted as low as 1*s.* 3*d.* when the rate of the day was 1*s.* $3\frac{3}{4}$*d.* to 1*s.* 4*d.*

8014. You are satisfied then that in 1893 there was a redundancy of currency?—I think so.

8015. More than the trade of India required?—Yes. The effect of the Sherman Act had been to cause large speculations in remitting silver to India. The extent of these was given before the Herschell Committee, who, I believe, were satisfied as to the redundancy for the time being.

8016. If the Herschell Committee had not inserted that limit of 1*s.* 4*d.*, do you think the rate of exchange would have risen higher than it is now?—It is entirely a matter of opinion. I think myself that there would not have been a block to the rise, as there is now. The course of events is this: directly the exchange gets to 1*s.* 4*d.*, or practically to that, people stop operating for the rise, and sell for a fall, as that is the only means by which they can make a profit on exchange.

8017. Do you think 1*s.* 4*d.* a reasonable rate?—I do.

8018. If you had a clean sheet, is that a rate that you would recommend?—I should. I expressed the same opinion before Lord Herschell's Committee, before I had seen the minutes of the Government of India, which I think pointed to 1*s.* 6*d.*

8019. Will you just repeat your reasons?—I thought that rate fair at that time. First, because it was not a greater variation from the existing rate than had been known to occur in the ordinary fluctuations of exchange when the par was 2*s.* per rupee; secondly, because it was only just that the Government when introducing a new system of currency should show some consideration to the interests that had suffered by the severe fall that had taken place in consequence of the demonetization of silver in Europe. (I may mention that when 1*s.* 4*d.* was recommended, the actual rate was 1*s.* 2*d.*) Thirdly, because a rate of 1*s.* 4*d.* did not differ widely from the average rate of the preceding five years. The average was nearly 1*s.* 5*d.* Fourthly, because a higher rate would have put too great a strain upon the new interests that had been allowed to grow up on the faith of the existing state of the currency of India. Those are the four reasons; and I may say that whereas those reasons influenced me at that time in fixing the rate at 1*s.* 4*d.*, the exports of the last five years have proved that the rate of 1*s.* 4*d.* was not higher than the export trade of India could bear.

8020. Are you of opinion that a low rate of exchange is a permanent advantage to the export trade?—I am not.

8021. Why not?—If the rate had been fixed at 1*s.* 3*d.* or even 1*s.* 2*d.*, certain interests would have maintained that a further fall should not have been arrested by the action of the Government. It appears to me a fallacy to assume that a low rate of exchange is a permanent advantage to the export trade of India. While the rate is falling there is no doubt a great inducement to press forward exports to catch the higher sterling prices ruling in European markets, and therefore the volume of exports may be expected to increase; but when exchange has found its lowest level, if such were possible on a silver basis, the whole advantage would disappear in the adjustment of the lower sterling price of commodities, and then disappointment would be caused by the absence of the stimulus of a still further fall: just as unhealthy stimulants lose their effect on a patient when not constantly increased.

8022. Are you in favour of the reopening of the mints?—No, certainly not.

8023. Will you just tell the Committee why you object to the reopening of the mints?—I object to the reopening of the mints because the currency of India would be at the mercy of the speculators in silver. I suppose there is no commodity which is more subject to manipulation by American speculators than silver, and I think it would be most unwise to place the finances of India and the trade of India, upon such a shifting basis.

8024. Are you in favour of the establishment of a gold standard for India?—I am.

8025. Do you include a gold currency at first?—Not at first. I think it will take some time for the present system to work out. I am in favour of a gold standard for India without a gold currency at first. It is impossible to devise a complete scheme which will satisfy the conditions of India. The method must be tentative and step by step. It has taken five years to prove that Indian exchange can be separated from the price of silver. It may require another five years to prove whether the people can be trusted with a gold currency. But this is a point which should be left to the judgment of the Government of India, who have more opportunity than any single individual of forming a correct opinion on matters appertaining to national characteristics.

8026. I presume that you mean by the remark, "whether the people can be trusted with a gold currency," whether the gold would not be abstracted from the currency for the purpose of hoarding?—Yes.

8027. Do you agree with Mr. Arthur that it would be a mistake to fetter the Government with any special recommendations?—I agree with Mr. Arthur that it would be a mistake to fetter the Government with any special recommendations, as to the method of introducing the gold standard. I would qualify that by saying, that while I would not prescribe to

Mr. H. Coke.

26 July 1898.

the Government a complete scheme for the introduction of a gold standard, I cannot think that it would be desirable to withdraw 12 crores of rupees from the diminishing circulation, and melt them up.

8028. You do not agree, in fact, with the proposals of the Government of India to establish a gold currency?—I do not agree with that proposal.

8029. You are speaking of the artificial contraction of the currency?—Just that.

8030. There is another proposal of the Government of India, which is the immediate introduction of a gold currency; that is, making gold legal tender. Do you approve of that?—I should leave that to the discretion of the Government, but as I said before, the change must be gradual.

8031. I suppose, subject to those two qualifications, you see no insuperable difficulty in establishing a gold standard and gold currency?—No.

8032. You would have a gold standard with a silver token currency?—At first I would have a gold standard with a silver token currency, and see how that works before issuing sovereigns for general circulation.

8033. Have you considered Mr. Lindsay's scheme?—I have.

8034. Will you tell the Committee what you think about that?—I view Mr. Lindsay's scheme with some favour. His idea of a gold standard office both in England and India is somewhat akin to the suggestion made by me before the Herschell Committee, that Indian Exchange might be worked through a State bank, which should also undertake to make the remittances of Government; but Mr. Lindsay leaves the latter to be dealt with as at present, so that the operations of the gold standard offices and the sales of Council drafts might clash. There is also the financial responsibility which the Government decline to accept. If these two objections could be overcome, I think the gold standard offices might control the exchanges just as the Bank of England settles the rate of interest in London without interfering with the operations of private banks.

8035. With reference to Council bills, would not Mr. Lindsay's scheme, by prescribing a minimum rate, practically settle the price at which Council bills would always have to be sold?—There would be a greater demand for Council bills at certain times of the year, and then the rate would be higher.

8036. And do you think that that would take the price up above 1*s.* 4*d.*?—I think it would.

8037. Are you satisfied that the present mode of disposing of Council bills once a week by a supposed auction is the best mode of making the Government remittances to India?—I should not like to express any opinion against it.

8038. Have you any opinion with reference to placing a duty on the import of silver as part of this scheme?—A very strong one.

8039. Just tell the Committee what it is?—If the Government could see their way to fixing a minimum rate of exchange, as proposed by Mr. Lindsay, much of the difficulty would be overcome, but when the Government, who are responsible for the financial results, openly affirm that they cannot undertake the responsibility, it would in my opinion be unwise to press them to do so. The effect of a minimum rate would be at once to eradicate the speculative element which intensifies the tendency to a fall in exchange, even more than the cessation of exports. Lastly, I suggest that the Government might strengthen their position materially by placing a duty on the import of silver, equivalent to a rate of exchange of 1*s.* 4*d.* the rupee. The value of the hoarded mass of silver already in the possession of the Indian community would then be raised to the present artificial value of the rupee, and there would be no inducement to ill-disposed persons to increase the volume of currency by illicit methods. There is a suspicion that all the silver which now goes to India does not go for manufacturing purposes or for the ordinary purposes of trade. There is a suspicion; I do not think it can be proved.

8040. Do you think it goes for illicit coinage?—It goes up country and something is done with it that the Government do not know. It disappears from view.

8041. I suppose there is also a large quantity of gold sent to India, of which we do not know the proposal?—A great deal of gold goes there for hoarding, and a great deal is used in the manufacture of puggarees and native dresses.

8042. Now have prices remained pretty constant with the falling exchange?—The gold prices in this country?

8043. In India?—The silver prices have remained practically constant. Evidence was given before the Herschell Committee, from 12 of the principal markets in India, of most of the leading articles of trade, showing that, whilst exchange had been falling from 2*s.* in the rupee to 1*s.* 3*d.*, the silver price had been practically unchanged; but to my certain knowledge the whole thing is adjusted in the gold price in this country. My own experience for the last 20 years has satisfied me that whereas the average of silver prices in India has not varied, the fall in exchange has been adjusted in the gold price in this country. Our firm used to receive large consignments of the produce of India for sale in European markets. When exchange continued to fall rapidly, affecting adversely remittances of the proceeds of these consignments, native dealers put a stop to consignments, and insisted on sales to arrive, settling both price and exchange at the moment. As exchange continued to fall, lower sterling bids continued to be accepted, but the silver price remained the same, and that was all the native shipper cared about. Each fall in exchange enabled a new transaction to be effected without any loss of silver price. Dealers and merchants secured the profits, and highly appreciated the situation which allowed of such active business, not considering what would happen when the "hard pan" of lowest exchange was reached.

8044. The great bulk, or practically three-fourths of the trade of India, is with gold-using countries, is it not?—At the time of the Herschell Committee the proportion was two-thirds to one-third

(*Chairman.*) Perhaps Mr. O'Conor will tell us what the actual figures were.

(*Mr. O'Conor.*) Very nearly 80 per cent. is with gold-using countries. Several countries have adopted the gold standard since then.

(*Witness.*) I am speaking of the time of the Herschell Committee. At that time the proportion was 67 per cent., so that if it is now up to 80, as Mr. O'Conor says, the trade has increased with European countries.

8045. Would you regard that as an additional argument in favour of the gold standard?—I should regard it as a strong proof that the closing of the mints has had a beneficial effect on the trade with gold standard countries.

8046. (*Lord Balfour of Burleigh.*) I do not understand that you have any actual knowledge of illicit coinage in India?—I have not.

8047. And if the testimony of officials in each of the provinces of India were to the effect that, having made careful inquiries they had not been able to trace it, would you be inclined to place reliance upon their views?—I place great reliance upon official information in India, because I know that they have means of obtaining accurate information that the outside public have not.

8048. Would not this be a fair way in which to put it, that if there were large manufactories of illicit coins that would be sure to be found out, and if there were many small ones it would be almost certain that the accuracy of the work would so vary that it would be detected in that way?—I could not say with any certainty that there is illicit coinage. I only say that many people suspect that there is.

8049. (*Sir D. Barbour.*) You said that the Government of India minute mentioned a rate of 1*s.* 6*d.* for the rupee, not 1*s.* 4*d.*?—I think there was something pointing to 1*s.* 4*d.*

8050. My recollection of it is this (and I ought to know) that the Government of India did not fix any rate, but gave a promise that under any circumstances the maximum rate should not exceed 1*s.* 6*d.*?—As I said in my evidence in chief, when I expressed an opinion that the rate which the Government should endeavour to establish should be 1*s.* 4*d.*, I was not aware that the question of the rate had been discussed in any minute that came from India; and, therefore, I afterwards read, with great interest, the minute on that subject. I was under the impression that no other rate than 1*s.* 6*d.* was referred to in that minute.

8051. Referred to as being the maximum under any circumstances?—That might be so.

8052. You do not approve of the proposals of the Government of India, I understand, because you think it would be a mistake to melt down rupees in the way they propose?—I think so.

8053. Do you think that if their policy was carried out far enough, it would result in a gold standard?—Probably.

8054. But your objection to it is that the carrying out of that policy might be attended with certain evils, the risk of which you are not prepared to run?—What I think is that the 1893 policy has worked fairly well. It has come to a point where, after several great struggles, the financial people in India see that a rate of 1*s.* 4*d.* is very likely to be established—established, I may say, on the same fixity that a 2*s.* rate was established. I have had experience in India when the rupee was 2*s.* 3*d.*, also when it was 1*s.* 10*d.*, so that when silver was recognised in the world generally as money, there was a variation of the rupee between 1*s.* 10*d.* and 2*s.* 3*d.*, according to the demand for money in India at those particular times. It had nothing whatever to do with the market price of silver, but it was a variation in exchange equivalent to the effect which is produced here by the Bank rate going up sometimes to 10 per cent., owing to some exceptional circumstances, and falling again to 2 per cent. when money becomes easy.

8055. The question I want to put to you is this. Your objection to the Government proposals is that the melting down of rupees might cause evils which you think it is desirable to avoid?—Yes, I think it would be an extreme measure, which is unnecessary under the circumstances.

8056. And might produce evils?—Might produce great evils.

8057. I do not know whether you have given any attention to what some people have called the evasion of the maximum in connexion with the sending of gold to India. They have said that when the rupee goes up to 1*s.* 4*d.*, or a little over, people know you cannot go any higher, and so they hold off their transactions?—Yes, that is what I said.

8058. Now, when exchange is high, sterling is cheap and rupees are dear. Is not that so. You get more sterling for your rupees; you get 1*s.* 4*d.* for your rupee instead of 1*s.* 1*d.*?—Yes.

8059. When exchange is high, sterling is cheap, and rupees are dear, and when exchange is low, sterling is dear, and rupees are cheap?—There are two methods——

8060. First of all, do you agree with that; that when exchange is high, sterling is cheap, and the rupee is dear; and, on the other hand, when exchange is low, sterling is dear, and the rupee is cheap?—When exchange is, say, 1*s.* 3*d.*——

8061. Or when exchange is 1*s.* 1*d.*, sterling is dear and the rupee is cheap?—Yes, of course, that is so.

8062. Now the object of a man in business is to buy in the cheap market and sell in the dear market?—You mean his productions.

8063. Anything—any man who is in business, buying and selling, will buy in the cheap market and sell in the dear?—As a general statement, yes.

8064. Consequently, if a man has sterling to sell and exchange is 1*s.* 4*d.*, and he knows that exchange cannot go higher he will like to hold on a little (if he can manage it) on the chance of sterling becoming dearer?—Yes.

8065. On the other hand, an importer who may want to sell rupees and get sterling, would like to carry through the transaction when exchange is high?—That argument applies to commodities generally, but money is not a commodity.

8066. I entirely agree, but I say that a man who has anything to sell, whatever it is, likes to get as good a price for it as he can, and if he wants to buy he likes to buy as cheaply as he can?—Of course.

8067. Then the result is that a man who has sterling to sell when exchange is very high may hold off for some time?—Yes.

8068. And by not selling at that time he tends to keep exchange down?—Yes.

8069. On the other hand, the man who wants to carry out the opposite transaction, the importer, brings forward his transaction to get the advantage of the high exchange?—Yes.

8070. And in that way he too tends to keep exchange down?—Yes.

8071. Both these men transfer the transaction from one period of time to another period of time?—That is all.

8072. By one man not carrying it out at once, and by the other carrying it out sooner than he would otherwise have done, they tend to keep exchange down when it is high, but do they not by that very fact tend to make it go up at a future time?—No doubt.

8073. So that the result is that although the exchange is kept down at one time, it is made higher at another time?—Yes, it is the same thing with speculators in futures. People "bear" the market in futures, and it creates a market for covering.

8074. So that the result of this system of evasion of the maximum, is simply to keep exchange down when it goes to the maximum, and to keep it up when it tends to go to the minimum?—Yes. But the very fact of these speculative transactions depressing the market more than it ought to be depressed under the normal state of things creates a want of confidence in exchange. That is the evil of it. It is undesirable that a country should be subjected to these speculations.

8075. I agree, but I wanted to bring that out, that that system of evading the maximum has the effect, not of lowering the average exchange of the year, but of lowering the maximum and raising the minimum?—Just so. Of course, when you cannot get above a certain maximum and you can make any minimum, as in the present state of things, the principle of forward speculative transactions does not so much apply, because we have a system which prevents them being cornered and the price going up against them.

8076. Now if the ultimate result of this evasion of the maximum was to be this, that in the slack season somebody found that in order to cover himself he had to import gold into India, that would create great confidence in the future of exchange?—Yes.

8077. (*Sir J. Muir.*) You referred to the stringency in Bombay recently?—And in Calcutta too.

8078. What was the Bank of Bengal rate?—12 per cent., I think.

8079. Was it not 13 per cent.?—It might have been; I am sure it was 12 per cent.; it might have been 13.

8080. But that was not the measure of what merchants in Bombay had to pay for money. Is it within your knowledge that merchants in Bombay took Government paper to the manager of the bank and asked for an advance in the ordinary course of business against that paper; they were refused at first at 13 per cent., and then they said "At what rate will you lend it to us?" And the answer was "We cannot lend it to you at any rate." They

Mr. H. Coke.

26 July 1898.

said "We have engagements maturing, and we must "have the money or we shall be bankrupt; we will "give you anything, up to 18 per cent." Have you heard of that?—So we have been informed. And further than that, I have heard it stated that you could not get rupees in the bazaars, upon gold bars, at 25 per cent. from the bullion dealers.

8081. Being an Indian merchant, you know that this has been an exceedingly sore point to all the merchants in Calcutta, Madras, and Bombay?—No doubt.

8082. In 1893 you said there was redundancy of currency?—Yes.

8083. What evidence is there of that?—There was an enormous amount of silver shipped out to India without any sufficient cause, except the operation of the Sherman law. People thought that exchange, which was then low, would be going up to 2*s.*, and there was an immense amount of silver sent out for no other purpose but to get the expected profit on exchange. The Sherman Act did not have the effect expected, and the pendulum swung in the opposite direction.

8084. Now, I am not satisfied that there was any redundancy in 1893, that is to say, that there were more rupees in circulation than were needed?—That could be proved by the amount of silver tendered at the mint and the issue of Government notes; that could be proved officially.

8085. Still, we have no proof of that, that is to say, the merchants of India, the majority of them, say that there was no redundancy of currency in 1893. Now, where is it visible; where is it made patent?—I think Mr. O'Conor can best answer that question.

8086. Mr. O'Conor is coming before us to-day, but I am satisfied about it, as far as I can gain any information, and I should like you to show me where there was any redundancy in 1893?—It is placed on the records of the Herschell Committee, I think, that there was a redundancy, by the statement of the immense amount of silver that had been sent to India in the preceding 12 or 18 months, and also by the great increase in the issue of Government notes. I will not undertake to give the Committee anything further than my own experience.

8087. Then you said that you objected pretty strongly to 12 crores of rupees being withdrawn from circulation now and melted?—Yes.

8088. Is not that going a little on the same lines that the Government of India have been going on in the last five years, that is to say, they have refused to coin any more silver? It is just going a little further in what some of us regard as the wrong direction, but you would call a halt now?—Whereas I am satisfied with the positive policy; I will not adopt the negative.

8089. You think they would not have got the rate up to 1*s.* 4*d.* unless they had closed the mints?—I think not.

8090. Therefore, this has been a despotic interference with the ordinary course of business?—No, I do not agree with you at all in that view of the matter. The first duty of any civilised country is to attend to the currency. Currency laws are made by Government. The currency of India was established in 1835, when silver occupied an entirely different position in the world to what it did after 1874. When the Government find that they have a currency based upon conditions that have been entirely altered, I think it is the duty of the Government to alter its currency laws to meet those conditions, and it was not any arbitrary interference with what some people call the natural state of things, but it was a duty thrown on the Government to protect the interests of India generally, and not to allow one class of investors or traders to benefit by the loss of another; currency laws are artificial, not natural laws.

8091. You said that in your experience you had had the exchange at 2*s.* 3*d.*?—Yes.

8092. So have I, and at 2*s.* 2½*d.*, and as low as 1*s.* 10*d.* There was no necessity then, was there, for interference?—That was only for a very short time, and under special circumstances. Sometimes you have the bank rate at 10 per cent., and I have known the Bank Act to be suspended on that account twice.

8093. Once, I think, in my time?—Well, if it was not actually suspended, permission was given to issue notes, but you do not want to legislate for exceptional circumstances of that kind.

8094. That was brought about by natural causes, and there was no interference by Government to force the rate up to 10 per cent.?—I do not think there was anything natural about that.

8095. Did the Government do anything?—The Government did not do anything, because there was known to be a temporary pressure for money which in the ordinary course of business would settle itself, just as the exchange in Bombay went back from 2*s.* 3*d.* to 2*s.* as soon as there was time for remittances from London to reach that place.

8096. We were talking of England. The suspension of the Bank Act was brought about by excessive speculation on the part of money houses in various parts of the country. The Bank Act was suspended, and immediately was restored. Now that state of affairs in London was not brought about by any interference on the part of the Government?—No.

8097. They did not force the rate up for any objects of their own?—No.

8098. What the merchants of India complain of is that the Government in India have taken steps, whereby they forced the rate to 18 per cent.?—I only wish to say that it was not the action of Government which produced the state of things you refer to, but the basis of the currency fell away, and Government had to repair the breakage.

8099. In other words what you call redundancy in 1893 has been turned in 1898 into stringency?—Yes, but the trade could have got any amount of rupees if they had tendered gold to the Bank of England.

8100. The redundancy has been turned into stringency by the action of the Government in closing the mints?—Yes.

8101. The fourth reason you gave for saying that the rate was fair, was "because a higher rate would have "put too great a strain upon the new interests which "had been allowed to grow up upon the faith of the "existing state of the currency of India." What are those new interests?—Those new interests were, all the people who had been trading on a basis below 1*s.* 4*d.*

8102. We have been receiving numerous communications from the Indian Tea Planters' Association in London, a very strong body, representing, I am told, 25,000,000*l.* of capital sunk in tea planting, and representing a very large body of shareholders all over the United Kingdom. They feel that they have a very strong grievance here. That is to say, because they started with large capital, having, of course, no anticipation that Government were going to fix the rate at 1*s.* 4*d.* So far as their operations are concerned, you will see that the difference between 1*s.* 4*d.* and 1*s.* 2*d.*, which they held ought to have been the rate, makes a vast difference to them in laying down funds in Calcutta to pay the wages of their coolies. At 1*s.* 2*d.*, of course, they would get far more rupees than at 1*s.* 4*d.* What is your opinion upon that?—My opinion is very clear upon that point. In the first place, the tea industry of India commenced long before the fall of the rupee, and a great deal of the capital that was sent out to start the Indian tea business was sent out at a very much higher rate of exchange. People engaged in these early operations had no right to expect a profit from the subsequent abnormal state of the currency. It was an accidental profit quite unconnected with the tea industry, and they could always secure themselves by making forward contracts in exchange. Then, again, the largest of the Ceylon tea companies have been brought out in the last two or three years, when the promoters knew perfectly

well that the Government was endeavouring to establish a 1*s.* 4*d.* rate.

8103. Which company do you refer to?—I dare say you know many of the companies. Their names can be found in the Stock Exchange lists.

8104. I do not know as to that, but I know that the planters of Ceylon and India complain bitterly that they are unjustly used, and that this is hard upon them?—But let me say that it is an unreasonable complaint: it is not a profit that they ought to have expected on the tea industry, but it is a profit on exchange.

8105. You did not answer my question. Suppose that I sell a bill on London when exchange is 1*s.* 2*d.*, will that be an advantage to me as compared with my having to sell at 1*s.* 4*d.* to lay down the wages of coolies in Calcutta?—I have no doubt what you say is quite right, that if they can get exchange at 1*s.*, they will get their money out at a much greater advantage.

8106. Is not a tea-planter entitled, when he puts his money into the soil, to expect that the Government will not, in an arbitrary manner, fix an arbitrary rate?—But the tea-planter put his money into the soil when he had no reason to expect that he would make this profit.

8107. He took the chance of its going up or down; he knew the rate had been 2*s.*?—He knew the rate was 2*s.*; a great many of them put their money in at the rate of 2*s.*, and then it went down to 1*s.* 4*d.* It was entirely accidental.

8108. You are talking of the people who put in their money 25 years ago, but men who put in their money 25 years ago are in a different position?—The great point is that the trade has been very largely extended since 1893. Properties have been bought and the trade has been very much extended, when they knew that the Government was endeavouring to establish a rate of 1*s.* 4*d.*, so that they have no right to complain.

8109. What about the people who put in their money when the exchange was 1*s.* 9*d.*?—I do not think there are many of them.

8110. (*Chairman.*) I suppose they would make a greater profit if the exchange went down to 2*d.*?—Yes, and then they would not be satisfied.

8111. Is it the profit on a depreciated currency?—It is the profit on a depreciated currency, and not a legitimate profit to the industry.

(*Sir J. Muir.*) I am afraid you are not justified in saying that they would not be satisfied, because I think none of them would desire to see such a rate or believe it possible.

8112. (*Sir C. Crosthwaite.*) Am I right in understanding that you said that when a maximum rate of exchange for the rupee was established, it would have been advisable to establish a mimimum rate at the same time?—I will not go so far as to say that it would have been right to have established a minimum. I do not think the Government would have been justified, not knowing their responsibilities in doing that; but I say that now, having had the experience of 5 years, we have got to a point where it is practically possible to establish a minimum rate without any great responsibility.

8113. How would you do it?—Somewhat after Mr. Lindsay's method.

8114. In relation to the stringency of the money market in Bombay, you mentioned the fact that merchants within your knowledge could not borrow rupees on gold at 25 per cent.?—So I have been told by letters received from Bombay, it is not within my own knowledge.

8115. I want to know why, under those circumstances, they did not take the gold to the Treasury and buy rupees at 15 to the sovereign; would it not have been cheaper?—I cannot tell you why they did not, except that they thought, as many people did, that the rupee would be 1*s.* 3*d.* in August. There was a very strong feeling on the part of many people: large transactions were entered into on the basis of 1*s.* 3*d.* or thereabouts. It was want of confidence that prevented people taking their gold.

8116. And the feeling that if they did put gold into the Treasury they could not be certain of getting it back?—Just so.

8117. (*Mr. Hambro.*) You spoke of the price of forwards as one of the signs that people did not believe in the rate fixed. The present rate is about 1*s.* $3\frac{1}{16}$*d.* Have you any idea what forwards are now?—I do not know. I do not hear much of that.

(*Mr. Campbell.*) It is 1 per cent. up to December.

8118. (*Mr. Hambro.*) You spoke of a duty on silver to make it equivalent to the exchange of 1*s.* 4*d.* Did you mean to fix that duty now, or did you mean to have a moveable duty which would move with the price of silver?—First of all, I may say the principle is one thing, and the method of carrying it out is another.

8119. But there are two principles there?—The principle of making silver equivalent to the rupee at 1*s.* 4*d.* is one principle. How to do it is another thing.

8120. But had you in your brain the idea of an import duty, moveable or fixed?—I think it should an *ad valorem* duty.

8121. I wanted to know whether you meant an *ad valorem* duty or a fixed duty?—An *ad valorem* duty.

8122. (*Mr. Holland.*) Did I understand you to say that an alteration of exchange affected the gold price in various commodities?—Yes.

8123. In such a commodity as cotton, for instance; do you consider that an alteration of exchange affects the gold price?—In this country?

8124. Yes, here?—Certainly.

8125. Do you not think that the question of the supply of American cotton is the all-important factor in affecting the gold price?—That is only one of the factors. I say that, all other things being equal, year by year the fall of exchange will very much affect the gold price. Suppose American cotton were the same amount this year as last year, then a fall in exchange would make Indian cotton cheaper in Europe.

8126. You told us that you were in favour of closing the mints in 1893. Has the subsequent experience that has been gained on this subject changed, in any way, your views?—It has very much confirmed them.

8127. Then the closing of the mints as a policy has had the effect that you anticipated?—Yes.

8128. Do you consider the present stringency in the money market has been caused at all by the closing of the mints?—Yes; but the closing of the mints was to be a tentative measure, followed by a further measure. We have now got to the time when I think that that further measure should be put into operation.

8129. And do you think the putting into operation of the further measure would relieve the stringency which everyone admits and deplores?—Most certainly. If people saw that they could get 5 per cent. in India, and only 2 per cent. here, and they saw a reasonable prospect of getting their money back without any great loss by exchange, they would send money out and get 5 per cent. there instead of 2 per cent. here.

8130. I understand that you agree with Mr. Arthur in thinking that it is better not to fetter the Government with recommendations?—It is best not to have any cut and dried scheme. It is for the Government to formulate a scheme that they think will work.

8131. You would give the Government a free hand?—Yes.

8132. But you object to the proposals that the Government of India have made?—I do not agree with all of them.

8133. May they not be taken as indicating what the Government of India would do if they had a free hand?—But, because I disagree with them, that is no

Mr. H. Coke.

26 July 1898.

reason why their policy should be wrong. It is a matter of opinion.

8134. You have told us that in 1893 you thought there was some redundancy of currency. Do you express an opinion as to whether or not there is redundancy now?—I think that the redundancy is worked off, and that we have got to the point where, in the words of the Government of India, there might be a redundancy at one time and a stringency at another.

8135. Do you think it important that currency should be elastic?—Yes.

8136. If rupees were melted down, does not that interfere with elasticity?—Unless you provide some other means.

8137. You are in favour of a duty on silver equivalent to 1*s.* 4*d.* The effect of that would be, as you state, to affect the value of all silver hoards, but would you contemplate, at the same time, the re-opening of the mints?—No.

8138. Then what advantage would you expect from that?—This very great advantage, that, whereas some 6,000,000*l.* or 7,000,000*l.* of silver go to India as an import, that would be very considerably reduced, and the exports then would exceed the imports of India by the amount of the diminution in the import of silver.

8139. And the Government revenues would be benefited in that way?—The Government revenues also would be benefited.

8140. Then if you would still keep the mints closed it is, perhaps, useless to ask you about seignorage?—I am very strong indeed that it would be unwise for the Government, both from the point of view of trade and from the point of view of the political relations of England and India, to go back to opening the mints. I think that such an important portion of the British Empire as India is, should have the same standard of valuation as England.

8141. Do you admit that silver-using countries have an advantage in foreign competition with India by the fall of silver—China, and so on?—They must have. The most important of the silver-using countries is China, but my opinion is that with the development of China by European influences, and the settlement of this business in India, very likely China will follow suit.

8142. (*Chairman.*) With the full knowledge of this competition with silver-using countries you adhere to your opinion?—I do, because the interest is as 80 to 20.

8143. (*Sir A. Dent.*) When you gave your evidence before the Herschell Committee you told us that you recommended the 1*s.* 4*d.*, and that exchange was then about 1*s.* 2*d.*?—Yes.

8144. Silver, I think, then, was about 3*s.* 3*d.*—it was anyhow over 3*s.*?—Yes, it was over 3*s.*

8145. Now, what is it?—27$\frac{7}{8}$*d.*, I believe.

8146. Is it your opinion that the new exchange to be fixed may be entirely independent of the price of silver?—Yes.

8147. (*Mr. Campbell.*) You say that your experience in the past five years points to 1*s.* 4*d.* as the suitable rate?—Yes.

8148. Of course, you are aware that it is only within the last two years that exchange has approached 1*s.* 4*d.*?—Yes.

8149. In the first two years after the mints were closed exchange went down to below 1*s.* 1*d.*?—Yes.

8150. I suppose it must be on the experience of the last 2 years that you rely in saying that 1*s.* 4*d.* is the suitable rate?—I think I explained that in my evidence in chief—that in the first year there was no rise to be expected because of the redundancy, but in the second year a slight portion of the redundancy disappeared, and in the third year a little more; then came the two periods of famine, and it has been only the last year or year-and-a-half when you may say that this new system of the Government has had a fair chance, and, as I say, the effect of the last two years has been confirmatory of the opinions that I held in 1893.

8151. Do you call years of famine and war and plague normal years to go by?—I say if there had been an ordinary crop and if the trade of India had been normal and not abnormal, this 1*s.* 4*d.* rate would have been reached sooner than it was reached.

8152. Are you aware that last year the Council bills were very much curtailed?—Yes.

8153. Do you think that had no effect in raising the rate to the neighbourhood of 1*s.* 4*d.*?—Not a greater effect than the cessation of exports. The diminution of drawings was counteracted by the curtailment of exports due to the famine.

8154. You also say that, in your opinion, exchange has no effect on trade?—On export.

8155. On trade generally?—On the export trade, I said.

8156. Then has it no effect on the export trade, and yet an effect on the import trade?—It tends to improve the import trade.

8157. Without affecting the export trade at all?—I can only say that, looking at the volume of the exports from India while this rise has been going on, you cannot say that it has interfered with the export trade.

8158. But do I understand you to say that it does not matter whether exchange is 1*s.* 4*d.*, 1*s.* 8*d.*, or 1*s.* 2*d.*, that trade will go on irrespective of that?—I think it will. It went on at 2*s.*

8159. Notwithstanding tight money, gold has not gone out to India as currency?—No.

8160. But you are aware that it has gone out to India in large quantities for sale at a higher value than the Government was offering?—Yes.

8161. Do you think that if the Government had offered 16 rupees for a sovereign instead of 15 rupees that would have attracted gold to India as currency? I think not. Until you had settled a basis of exchange at which it should be brought back, I do not think it would.

8162. Regarding trade with China, of which you have a large experience, has that been affected?—Very seriously.

8163. And permanently affected, do you think?—I hope that in time they will put their exchange right in China by establishing a civilized system of currency.

8164. But unless they do that the trade must be very seriously affected?—I question very much the opinions of those people who think that China is going to be a great competitor with India. For the very same reason that people will not send gold out to India, because they do not know exactly at what rate they will get it back, so, I think, they will be found very timid in sending out gold to China.

8165. With regard to a heavy import duty on silver, what effect would that have upon the price of silver in this country?—Theoretically it ought to send it down because it would curtail the demand; but that is not a question for me.

8166. Suppose it did send it down, that would accentuate the difference which now exists between India and China, inasmuch as China is on a silver basis, and India on the basis of the enhanced rupee?—Certainly.

8167. And to that extent it would still further add to the injury to India's China trade?—Yes.

8168. (*Mr. Le Marchant.*) You referred to the withdrawal of capital from India when exchange touched, or approximated to, the maximum point. Do you regard that as having affected the money market, and the rate of discount?—I think that that must have diminished the current supply of money in the financial centres.

8169. In fact, money in India changed hands—it passed into different hands that could not possibly use it for the same purposes of loans and discounts?—

That money was lying in India in banks, or in some investment or other that became available for money supply; when it was transferred to this country by a bill of exchange, the rupees which passed in payment by the bill, very likely went up country to pay for produce, and so reduced the loanable supply of money.

8170. In short, it was a material fact—not a formal set of book entries?—It was a material fact.

The witness withdrew.

Mr. EWEN CAMERON called and examined.

8171. (*Chairman.*) You are the manager of the Hong Kong and Shanghai Bank in London?—Yes.

8172. How many years have you been at the head of that bank?—In London I have been for eight years.

8173. How long have you been connected with the banking of India?—For over 30 years in India and China.

8174. I suppose you are not authorised to represent the bank here as a bank; you are simply giving us your individual opinions?—My individual opinions.

8175. And your directors will be in no way bound by what you say?—In no way.

8176. Now, were you in favour of, or opposed to, the closing of the Indian mints?—I was opposed to the closing of the mints.

8177. Will you tell us why?—I thought it would interfere with the natural course of trade in India.

8178. In your judgment, what have been the effects on the trade of India of the closing of the mints?—The trade of India, to begin with, suffered, but since then the trade has adjusted itself, and has been going on more satisfactorily.

8179. Do you mean that there was a temporary injurious effect which has now been met by a general re-adjustment, and that trade has now resumed the normal condition?—I think, to a certain extent, trade has resumed its normal condition. It has been interfered with by abnormal seasons of late and also by the great monetary stringency, which I attribute to the closing of the mints.

8180. Is there a want of confidence in the future of the Indian currency?—I think not. Misgivings have been felt in some quarters, but, speaking generally, I think there is no want of confidence in the future of the currency of India.

8181. Will you give us a little information as to the recent stringency? Just state, from your own point of view as manager of the Hong Kong and Shanghai Bank, what was the extent of the recent stringency of money in India?—I am not competent to speak of what is going on in India generally, but it is a well-known fact that the bank rate was 13 per cent., and that great inconvenience was caused to trade by the excessive rates—that merchants could not get accommodation at reasonable rates.

8182. Do you think the reason why they could not get accommodation was entirely the scarcity of currency?—Undoubtedly.

8183. You are aware that they could have obtained additional currency by either importing or depositing gold?—Yes.

8184. Why did not they avail themselves of that?—Large quantities of gold were imported, but the Government price was below what could be got for it in the bazaars.

8185. Do you think the mints should be re-opened?—I do not.

8186. Do you think that that would be injurious to the trade of India?—I think it would be very injurious to the trade of India, to begin with. It would dislocate trade entirely, for a time.

8187. You are aware, no doubt, of the various policies that have been proposed—the proposals of the Government of India and the proposals of Mr. Lindsay. What is your opinion as to the proper policy that should now be adopted?—I have a strong idea that sufficient time has not yet elapsed from the closing of the mints to form a positive opinion, or to formulate a policy. Even under ordinary circumstances, after such a radical change as the closing of the mints, five years is too short a period, and of those five years two have been very abnormal years owing to famine and plague, consequently I think we are not yet in a position to form an opinion. My own idea is that the formation of this Committee has been premature; but as it has been formed, my idea is that it should adjourn from time to time and gather information, and issue its report two years hence.

8188. I am afraid that that would be arrogating to ourselves the functions of Government. As we are appointed by the Government, it is our duty to make a report. However, I understand your point is that sufficient time has not elapsed for the fair trial of the experiment?—Exactly.

8189. The experiment (you will correct me if I am wrong) being to make silver coins in India a token currency, and, by some means or other, endeavouring to have a fixed rate of exchange of 1*s.* 4*d.*?—Exactly.

8190. That experiment you would wish to see tried a little time longer before you express an opinion favourable or adverse to it?—Yes.

8191. Have you any opinion of your own with reference to the desirability of a gold standard for India?—I think a gold standard is desirable if you can fix the ratio between gold and the token coin at a rate that would be advantageous to India.

8192. Have you any idea of your own what the rate should be?—I think we have not had sufficient experience. It may prove to be 1*s.* 4*d.*, as the rate is tending to 1*s.* 4*d.* just now; but there is evidence, judging from the last five years, that 1*s.* 4*d.* is too high. No gold has been sent in to the Government. Although large quantities of gold have been sent to India, the Government have not got any of it.

8193. Do you think if the rate were fixed at 1*s.* 3*d.* they would have got gold?—Possibly; it is more likely than at the higher rate.

8194. Have you thought at all of the possibility of a higher rate than 1*s.* 4*d.*—say, 1*s.* 6*d.*?—No.

8195. Now I am going to your China experience. Do you consider that India is handicapped in competition with China to the extent of the difference between the bullion and the exchange value of the rupee?—No; not to that extent.

8196. To any extent?—To some extent.

8197. What is the currency of China?—We have had no authoritative information upon that point. Theoretically, and to some extent in practice, copper cash is the currency of China. In all retail transactions, copper cash is the standard of value. For large transactions silver Mexican dollars and the Carolus dollars are used. The Carolus dollars are the old Spanish dollars.

8198. Where are they coined?—They were coined by Spain, but they are almost extinct.

8199. For retail purposes the currency is copper cash?—Yes. When the European merchant buys from the Chinese dealer, he pays in silver; the native dealer with that buys dollars and copper cash to pay the growers for their produce.

8200. Do you think that recent political events will have such an effect on the trade of China as will result in a new development altogether?—I think so.

8201. Would that, do you think, at all affect the currency?—The currency of China will have to be reformed when that takes place.

8202. Have you any opinion as to the benefit or the disadvantage of a falling exchange on trade?—My opinion is that a falling exchange does benefit trade.

Mr. E. Cameron.

26 July 1898.

8203. To any great extent?—It is only one element in many conditions that help it, but it tends to do so.

8204. (*Sir F. Mowatt.*) Did you say a falling exchange or a fall in exchange?—Well, a fallen exchange—a low exchange.

8205. A permanent low exchange, and not a falling exchange?—Yes.

8206. (*Chairman.*) Seeing that the closing of the mints has, apparently, not had the effect of stopping the import of silver, are you in favour of the Government adopting any policy to impose a duty on silver?—No; decidedly not.

8207. Do you think that that course would involve a serious fall in the price of silver?—It would involve a serious fall in the price of silver.

8208. And that, I suppose, would dislocate our trade with silver-using countries?—It would. Before the closing of the mints the trade with silver-using countries, as we have heard here to-day, was one-third, now it is only 20 per cent. If a further serious fall in silver takes place, I think there is great danger of losing the trade entirely.

8209. As a banker, have you any strong objection to the Government withdrawing a large quantity of silver from circulation and melting it?—Decidedly.

8210. You object to that?—Yes, strongly.

8211. (*Mr. Campbell.*) You say you think we have not had sufficient experience yet to judge of the proper course to follow with regard to the currency?—That is my opinion.

8212. But you are aware that money has been exceedingly tight in India during the last two years?—Yes.

8213. I suppose you agree that, in all probability, if nothing is done, the stringency will be repeated, and be worse this year and next year?—Yes, that is my opinion.

8214. Have you any idea of mitigating that in any manner while we are waiting, according to your suggestion?—That is a question I am not prepared to speak of with confidence, as of late I have not had much experience of purely Indian finance. I notice, however, that, similarly to our experience in this country, the in-gathering of the revenue in India tends to deplete the money market for the time being. The months when the Government balances stand highest coincide with the shipping season, and the influence of trade and revenue collection coming together naturally tends to make money dear. I therefore think that there ought be no great difficulty in devising a scheme by which the Government balances should be made available to relieve the situation during the busy seasons; the withdrawal of these funds later on would prevent undue ease during the slack season, and so tend to keep a more even rate all the year round.

8215. The money is kept in the Treasury just at the time when trade wants it most?—So I gather from the statistics.

8216. And if it could be made available for trade purposes at that time, it would prevent the extreme stringency we have seen?—Yes.

8217. Of course, you are aware that the Government now at the busy season let out their balances very freely by selling Council bills?—Yes.

8218. In addition to that, how would you make the money available to the market?—I think it might be done through the Presidency banks against Government paper.

8219. You would lend the surplus balances to the Presidency banks against Government paper?—Yes.

8220. And they, in their turn, would lend out the money to their customers as they wanted it?—Yes.

8221. Then when the busy season was over, I suppose these loans would be re-called?—That would be the idea, to re-call the loans and so tighten money up again in the slack season.

8222. So as to get money as near as possible at an even level throughout the year?—Yes.

8223. You say that no gold has gone in as currency to India since the mints were closed?—Practically none, because it always fetched a better price in the bazaar.

8224. Do you think that there would be more probability of gold going in as currency if the Government offered a better price for it?—There I must come back to my first idea, that we have not had sufficient length of time to come to a decision, but seeing that it did not come in at 1*s.* 4*d.*, I think it is only fair to assume that it would have a better chance at a lower rate.

8225. I suppose you admit that the fixing of the ratio is a very important part of the whole affair?—The most important part.

8226. What is your idea of how that proper ratio should be arrived at?—After the experience which I wish to have and the evidence I suggest that you should collect, we shall be able to form a conclusion. If gold begins to flow into the Government Treasury at 1*s.* 4*d.*, then I think 1*s.* 4*d.* should be the rate. If we find that gold does not come in at 1*s.* 4*d.*, then we must assume that a lower rate is necessary. The rate at which gold flows freely into the Government treasuries I take it to be the correct rate.

8227. Then you would be guided by experience?—I should be guided by experience.

8228. You would rather be guided by experience than, say, that the Government should fix upon a rate of their own, and force that rate on the market by artificial means?—Decidedly.

8229. We have heard a good deal about the example of Japan, which went on a gold standard some time ago, and we have been told that Japan is losing her gold. Have you any idea of the condition of Japan as regards her trade balances?—Last year was an abnormal year for Japan as well as for India. There was a scarcity of rice which compelled them to import very largely and put the balance of trade against Japan.

8230. That is exceptional, of course?—That is exceptional.

8231. I do not know whether you noticed in last week's "Economist" some particulars of the foreign trade of Japan?—I did not see it.

8232. The foreign trade of last year showed a balance of imports as against exports of merchandise of 56 million yen?—That I can quite understand.

(*Chairman.*) What would that be in sterling, roughly?

8233. (*Mr. Campbell.*) It would be about six millions sterling. That is the balance of trade against her?—Yes.

8234. Then, this year, for the four months the surplus imports of merchandise have been no less than 50 million yen. On the other hand, she has exported gold to the extent of 44 million yen. With a balance of trade such as that against her, are you surprised that Japan is losing her gold?—Not at all.

8235. It is the natural thing?—It is the natural consequence.

8236. The silver yen was called in when the gold standard was adopted?—Yes.

8237. And a large proportion of the yen have been exported to other silver-using countries?—Yes, a large proportion.

8238. Is there much of the yen left in Japan, do you think?—We cannot tell positively, but as far as our information goes, there are still 30 millions of yen available for sale.

8239. Does that include subsidiary currency?—No.

8240. Have you any information as to the amount of yen in circulation when the change was made?—No. On account of the large exportation of yen to Singapore and the Straits and different places, we have no means of arriving at that, but the total amount of yen coined by the mint amounted to 168 millions.

8241. That is about 20 millions sterling?—Perhaps not quite so much.

8242. (*Sir A. Dent.*) Since when is that?—Since the mint was opened.

8243. (*Mr. Campbell.*) I suppose, during these years, since Japan demonetized the yen, a very large amount of silver must have been sold in that form?—A considerable amount.

8244. (*Sir F. Mowatt.*) In Japan, do you mean?—Sold by Japan.

8245. (*Mr. Campbell.*) Do you think an amount sufficient to have a very appreciable effect on the price of silver in the world?—As a matter of fact, since Japan commenced to sell, from other causes silver has been going up.

8246. But if Japan had not been selling, might not the rise have been more pronounced?—Distinctly. It has been a factor, and a very important factor, in the price.

8247. Now that that is really at an end, of course that factor will cease?—That factor will cease, and silver will have a better chance by so much.

8248. You say that the chief currency of China is copper cash?—For retail transactions. For large transactions it is silver.

8249. That is to say, the European merchant pays silver for the silk or tea that he buys, and the seller of the silk or tea has to convert that silver into copper cash?—The native merchant converts it into copper cash through which he pays the small grower. The grower gets his payment in copper cash.

8250. How is the value of copper cash now as compared with what it was five or six years ago?—Since the closing of the mints, copper cash has advanced about 15 per cent., that is, speaking generally—it is quite 15 per cent.

8251. The same amount of silver would buy 15 per cent. less of copper cash than it did before?—Yes.

8252. To that extent has that reduced what you may call the handicap on India as compared with China?—Certainly.

8253. Are there any other charges which go to diminish that handicap?—There is an export duty on produce in China.

8254. Tea and silk have to pay an export duty?—Yes, tea especially suffers very much as the export duty is not *ad valorem*, but by weight, and consequently while it is comparatively light on high priced tea, it is very heavy on common and cheap grades.

8255. With these two influences, the higher price of copper cash and the export duty, the handicap is very much diminished?—As regards tea, yes.

8256. As regards tea or any other produce?—I do not know that there are other articles that compete very much with India. Tea is the principal thing; silk to a very small extent.

8257. Have you any idea of the extent of these export duties?—I will put it in this way. The price of tea varies from 70 taels to 8 taels per picul, and the export duty is a little over two taels per picul On a 70 tael tea the export duty is small, but on an 8 tael tea it is 25 per cent.

8258. Would 10 or 12 per cent. be a fair average? I should say 15 per cent.

8259. Then, taking 15 per cent. for export duties and 15 per cent. for the higher price of copper cash, the handicap is very considerably diminished?—But the exchange has gone down by 36¼ per cent. since the closing of the mints.

8260. There is still a large margin?—No, there is very little margin; you have 15 per cent. and 15 per cent., making 30 per cent.

8261. (*Sir A. Dent.*) Then there is the likin?—That is included.

8262. (*Mr. Hambro.*) You say that the price which ought to be fixed for the rupee ought to be somewhat determined by experience of what exchange does; but has not the Government rather burnt its boats, so to speak? I mean, having fixed a maximum, is it not very difficult to find out what the exchange suits itself to? If you removed the maximum, you would find out; but as long as you have the maximum of 1*s.* 4*d.*, as soon as it gets near that, every conceivable plan is adopted to try and evade the maximum?—Exactly.

8263. Therefore, if you wanted to get at really what exchange would go to, you would have to remove the maximum?—I see the difficulty of the Government in doing that; but once they arrive at the correct rate of exchange, the difficulty will be got over.

8264. It would have been easier if there had never been a maximum fixed?—But they wanted the gold to go into the country.

8265. But they never got any?—They never got any.

8266. Perhaps they would have got it the other way more easily. I only want to know whether, to get at the exchange, you would remove the maximum, and, as Mr. Bertram Currie proposes, leave it to arrange itself?—Theoretically, that is right.

8267. If you put a limit on one side and on the other, you never quite know what you can do?—Just so.

8268. Would you advise, then, the taking off of the maximum?—No.

8269. Now that the maximum has been put, you would keep it?—Yes.

8270. (*Mr. Le Marchant.*) Do you think it would counteract the prejudicial effects of a fixed maximum if Government were to undertake to give gold or sterling for rupees at a fixed minimum?—I think if a minimum were fixed it would give confidence; but, as I said before, until we have by experience found out what is the rate that suits the country, that cannot be done. When that is arrived at, then we should fix a minimum as well as a maximum.

8271. You were speaking of some measure to keep discount rates at a more even level throughout the year. Supposing anything of that kind were possible, would it be consistent with a favourable rate of exchange—would it interfere with the rate of exchange in any way?—Do you mean the lowering of the rates of discount?

8272. Yes, on the average?—The tendency of exchange is to get easier with cheaper money.

8273. Do you think lower exchange is a direct result of cheaper money, or that they both arise from the same set of circumstances?—From the same set of circumstances.

8274. In speaking of Japan and the loss of gold by the Government, may that have been caused by exceptional expenditure on the part of the Government? They have had a period of expenditure on reforms, and so forth?—As a matter of fact, I think that that exceptional expenditure has been met by the indemnity that they get from China. Really the gold was exported to adjust the balance of trade.

8275. There may have been excessive expenditure on the part of the whole country. The balance of trade being against it shows that the country has been taking imports to a very considerable amount without corresponding exports?—There are exceptional reasons for that this year. There was a scarcity of rice, and there is a prospect of the revision of the tariff, which has stimulated imports.

8276. If such a development of China took place as you speak of as being possible, would that lead to an introduction of foreign capital into China? It would hardly be possible without it, would it?—China must have foreign capital to develop it.

8277. If that came in largely from gold-using countries, would it lead to an adjustment of prices, an alteration of prices in China? Do you think prices in China would gradually rise?—The prices of commodities, you mean?

8278. Yes?—It is difficult to say, there are so many causes that affect prices The price there has to correspond with the price here to some extent.

8279. But the more China is brought into relation with foreign countries that use gold, there will be more conditions bearing on the alteration of prices?—The more she exports, I take it, the cheaper prices will become. China, so far, has only the benefit of low exchange and cheap labour. Later on, the

Mr. E. Cameron.

26 July 1898.

country will be opened up, and communication will be cheaper; we know that in India cheap communication has helped enormously to develop the trade of the country. So far, China has had very little but the exchange to help her in competing with other countries.

8280. Do you think that, if she had something more, if she had capital, there would be a greater tendency towards an equalization of prices in China with prices in other countries?—I think so; but then, again, probably we should consume more on this side; there might be a greater demand. That we shall get more produce from China in time there is no doubt whatever.

8281. (*Sir A. Dent.*) You said the difference in the copper cash now as compared with some years before was only 15 per cent. Is there not evidence in the Consular Reports and other documents that more often it is considerably greater than 15 per cent.?—It varies very much, no doubt. I have taken my figures for one month in each year since 1893.

8282. Then that copper cash is a very uncertain coin: it has depreciated very much in China?—Yes; there is no standard such as we have with the silver coin.

8283. It is adulterated with lead and sand and all sorts of things?—Yes.

8284. So that sometimes the difference is more than 15 per cent.; it might be 30 or 40?—In some places, no doubt.

8285. Have you heard anything of the Foochow Tea Improvement Company?—Yes, it was established last year.

8286. It is a very small concern, is it not?—And consequently, I understand, it has not been the success that was anticipated. First of all it was a success, but there has not been a sufficient quantity of tea treated to make a market for it.

8287. China, owing to the way she is piling up debt, will very soon have a question to solve, such as India has, as to large remittances home?—Certainly.

8288. And that will probably force her into some new currency system?—The first thing that will force China into a new currency is the construction of railways under European administration. There are several mints established in China, but not a national mint. Several of the viceroys establish mints of their own for coining silver into dollars and subsidiary coinage.

8289. Are they taken freely in China?—Only locally.

8290. As regards the stringency of money, we have often been told here that it is in a measure owing to the banks having sent their capital home. Can you give us an opinion about that?—I think the fact of the banks sending capital home cannot have had very much effect. In the first place, the capital of the exchange banks could not have been very large as compared with the trade of the country. As far as regards the bank which I represent, our capital has not been removed from India; it was not comparatively a large amount that we had, and it has not been removed. Our capital is on a silver basis, and it naturally remains there. As regards other banks, perhaps Mr. Campbell can tell you better than I can, but as a rule I think the capital held by the banks in the East has been taken away. But, on the other hand (I am also open to correction here), I believe the fact remains that all the exchange banks now employ in India as much money as they ever did. The removal of the capital from the East is more or less a matter of book entry.

8291. The capital which was formerly applied in rupee form is now applied in gold form?—Exactly.

8292. As a matter of fact, very nearly all the capital of the banks was remitted home years ago?—Yes.

8293. It was in the case of the Chartered Bank of India, Australia, and China, and I believe the National Bank and the Mercantile bank, too?—Yes.

8294. The money of the Chartered Bank was remitted at least ten years ago?—I think you may say the same of all the other exchange banks.

8295. (*Sir D. Barbour.*) You know, of course, that India has always been liable to have high rates of discount at certain periods of the year—in the busy seasons?—Yes.

8296 And sometimes, before the mints were closed, those rates of discount have been very high?—Yes.

8297. But the high rates of discount in the last year or two seem to have lasted longer than was formerly the case; they have been very high, and the high rates have continued for a longer time?—It has been so.

8298. That is ascribed, no doubt, with more or less justice to the closing of the mints. Now, can you explain exactly how the closing of the mints brings about this stringency? Of course, people say want of currency. I daresay you admit that currency and loanable capital are not quite the same thing. I do not think that merely to say it is want of currency will explain it. Can you give any fuller explanation?—The trade of India has been expanding, and there has been no addition made to its currency since 1893.

8299. But is a contraction of the currency necessarily the same thing as a contraction of loanable capital?—No.

8300. That is to say, that all the rupees that ever were in India are there still, although they are not in the banks, and not available as loanable capital?—When the trade expands, there is a larger area to be covered by the same number of rupees.

8301. But the proportion in the banks is not the same as before?—No.

8302. If, now, a number of merchants—natives of India—had saved money to the extent of 5 crores, and were to lodge that in the banks, the stringency of money would be removed?—Yes, by so much.

8303. Although there had not been a rupee added to the currency?—In the case you put, the 5 crores were taken out of savings, not withdrawn from circulation; so when deposited with the banks they would be added to the active currency of the country.

8304. It is adding it to that portion of the currency which is ready to be lent for the purpose of trade?—Yes.

8305. I suppose when the Government borrows in India, that tends to take some capital out of the market?—If the Government locks up the rupees it gets, undoubtedly.

8306. Or even if the Government spends the money in the construction of railways in the interior?—Then the money is released.

8307. But does it necessarily follow that it will go into the bank?—Not necessarily into the banks, but if not, then into the country generally.

8308. Does not the rate of discount depend on the balances in the bank, and not on the money circulating in the interior of the country?—I think the two go together. If money is abundantly circulated in the country, it finds its way naturally into the banks, because the import markets are affected by cheap money.

8309. It might find its way?—The tendency is for it to find its way there.

8310. But it might circulate and not come back to the banks?—It might take some time to come back.

8311. It might, or it might not?—In England you would know what became of it, but in India it is not so easy to trace.

8312. Now, I suppose the depositors—the men who used to deposit money in the banks—have taken advantage of the high rate of exchange, and sent their money home?—Naturally, to some extent.

8313. I suppose everybody connected with India has known instances of that?—Yes.

8314. And I suppose, again, the effect of the famine would be to use up capital for the time being?—Naturally.

8315. All these causes would add to the stringency?—No doubt.

8316. Now, as regards the Government assisting to keep down the rate of discount in the busy seasons

—do you know exactly where the Government balance is placed in India?—Not exactly.

8317. It is some time since you have been in India?—Yes, 25 years now.

8318. There is a portion kept, as I daresay you know, with the Presidency banks?—Yes.

8319. And there is a portion kept in a separate Treasury belonging to the Government in each of the Presidency towns?—Yes, in the reserve treasuries.

8320. And the rest is in the various district treasuries scattered all over India?—Yes.

8321. You have not suggested any means by which the Government should give assistance?—I have pointed out what to my mind causes the stringency, and I have left the means of relieving it to those who have better local knowledge than myself.

8322. It used to be the case that in times of great stringency, supposing the published rate of discount at the Treasury banks was (we will say) 12 per cent., the Government would lend money to the Presidency banks at 12 per cent. for the time. Do you think that that was a reasonable thing?—Yes.

8323. The Presidency banks, or some of them at any rate, have objected that that was too high—that they should get money from the Government below their own minimum rate?—I think if the Presidency banks are not able to supply out of their own funds the currency required, they should pay their full minimum rate to the Goverement.

8324. I may say that there is this difficulty about the Government keeping a large proportion of their cash in the Presidency banks, namely, that the Government balance is so large and the private balances are comparatively so small, that if any great emergency occurred the Government might have a difficulty in getting its money out when it required it?—That is a difficulty, undoubtedly.

8325. Another difficulty is that the Government collecting its revenue at a great many different places throughout India, must find it difficult to get their money quickly into the Presidency towns. For instance, the money they collected at (we will say) Quetta could hardly get down to the Presidency town under a week?—That may be so.

8326. Then, another difficulty—I do not know whether you consider it to be one—is that Government has felt that if it permanently and continually helped trade in India, it would lead trade to depend on the Government balances, and it might be necessary suddenly to withdraw those balances, and that would cause a great deal of evil. Do you think there is anything in that?—Yes.

8327. And you think that to lend the Presidency banks money at their published minimum rate is reasonable?—The Government should do that as far as is consistent with their own safety.

8328. You think that the banks and the public would have no complaint against the Government if the Government charged that?—No, that is all I think the Government can do for them. Of course, they can increase the Council drawings.

8329. So that if any bank was able to get money at, say, 12 per cent., its published rate, from the Government, and a customer went to that bank and offered 18 per cent. with perfect security, and the bank said, "We cannot find the money," that customer would be hardly treated; that is always on the assumption that the bank could get the money at 12 per cent. from the Government?—The fact of the bank being able to borrow does not carry with it the obligations to lend to all comers. Suppose I get a deposit at 4 or 5 per cent.: times of great stringency come later on, and I refuse to lend to my customer at 8 per cent., I do not know that there would be a great grievance as regards that particular deposit.

8330. Suppose the bank could get money from the Government at 12 per cent., but because they thought thot rate high the bank would not borrow from the Government; and then, suppose a customer came to the bank and offered 18 per cent. and the bank refused on the ground that it had not got money?—Then that would be hard on the customer.

8331. I do not say that that has occurred; I am putting a hypothetical case?—If it were known that the Government were prepared to lend money at a certain rate, it would have much the same effect as suspending the bank rate here—it would create confidence.

8332. I think that ought to be a great relief to the stringency if it could be done safely?—Quite so, it would have a great moral effect.

8333. You heard the questions that I put to Mr. Coke about the evasion of the maximum. Do you agree with his answers generally that that tendency to evade the maximum, although it may keep down exchange at the moment, and perhaps prevent gold from going to India at the time, would have the effect at a subsequent period of keeping up the exchange?—Yes, I think that is so.

8334. And, of course, if that evasion of the maximum was carried on under all circumstances, and, to a great extent, you might find that what used to be the minimum was as high as the maximum?—Yes.

8335. You do not propose, in any case, to go above a rate of 1*s.* 4*d.* now for the Indian gold standard?—No, we have not yet come to the 1*s.* 4*d.*

8336. So far, you have not expressed the opinion that it is necessary to have a high rate of discount in order to have a high rate of exchange?—Not necessarily; in fact, it might be the other way. A low rate of discount (and I call 3 or 4 per cent. a low rate for India) would mean dull trade. I call 6 or 7, perhaps 8 per cent., a healthy rate, and consistent with active trade. That would probably have a better effect on exchange than a rate of 12 per cent., where people would find difficulty in moving their crops.

8337. Other things being equal, a low rate of discount is a good thing for trade?—Undoubtedly.

8338. If you had a big trade with a 3 or 4 per cent. rate, if it was possible, that would be a good thing?—Yes.

8339. If you could supply a sufficient amount of capital at that rate?—Yes.

8340. You said there was a tax on the export of tea from China. That is not a new tax?—No, it is an old tax.

8341. You expect greater exports from China when the railways are made. What do you think they would be likely to be?—There will be an expansion of the present commodities.

8342. What are those chiefly?—Tea, silk, hides, straw-plaits, and a large body of miscellaneous goods which have come in since the fall of exchange which were never exported before. If we give China the benefit India has of improved railway communication along with low exchange, we may have still further exports, and probably new articles which we do not know of now.

8343. And China having to pay interest on a large debt must export more?—Yes.

8344. Therefore, apart altogether from the effect of the competition produced by the silver standard, it is to be anticipated that under any circumstances India will have to encounter more competition with China in the future?—That will be so.

8345. (*Sir J. Muir.*) This copper cash is a new thing to me, and I should like a little information from you about it. What is the value of the copper cash; what is it called, to begin with?—Copper cash is a copper coin.

8346. Made by whom?—By the Chinese.

8347. By the Government?—By the Government, practically; that is, each provincial Government manufactures its own copper cash.

8348. Then is there any way of testing its value by the Government?—It is very inferior in some places. There is a report here which explains how, in some districts, it is inferior to what it is in others.

8349. There is no test of its intrinsic value?—No.

Mr. E. Cameron.

26 July 1898.

8350. What is the value compared with pice in India?—Take the tael; that is worth now 2*s.* 7*d.* You would get 1,100 or 1,200 copper cash for a tael.

8351. Is that the only coin they have?—For retail transactions in the interior. A man will carry a string of these about with him.

8352. Anybody could refuse to accept one if he thought it adulterated?—Yes.

8353. In point of fact, is that done?—Yes.

8354. Are they always accepted at the same price?—If a man sees one that is obviously wrong he will turn it out, just as a man here will refuse a false or worn sixpence.

8355. What is the size of the coin?—About the size of our shilling.

(*Sir A. Dent.*) They vary; some are the size of a fourpenny-bit; some, the size of a shilling.

8356. (*Sir J. Muir.*) What is the value of the tael?—The exchange value of the tael at the present moment is 2*s.* 7*d.* It is a fixed weight in silver—565 grains of silver.

8357. And the dollar?—The dollar is 1*s.* 11*d.*

8358. Those are the Mexican dollars?—Mexican dollars; that is the exchange value of them.

8359. What do you fancy to be the intrinsic value of the dollar—the solid silver in it?—According to the exchange; it is based upon its intrinsic value.

8360. Is it a little larger than our rupee is?—It is double the size of the rupee.

8361. And it sells just now at 1*s.* 11*d.*?—That is the intrinsic value of it at present, and the exchange value, too.

8362. Now, to go for a minute to the question of the action of the Government of India in regard to the Presidency banks, especially the Bank of Bombay, for it is in connexion with that that I have got the most specific information. The manager, under the instructions of the directors, applied to the Government when they found the stringency coming on, and that they would be unable to meet the applications from their customers. They explained the circumstances to the Government, and said, "We are "offered Government paper; we should like to oblige "our customers, but we have not the means of doing it; "will you lend us on such and such securities as many "rupees as will enable us to meet the demands of our "customers"? They were absolutely refused, point blank refused. Naturally that created a very bad feeling in Bombay, an exceedingly bad feeling. The feeling seems to be that, instead of helping merchants and others in Bombay who are solvent, and who have the means of carrying on their business, the Government refused to advance this money, the only reason being that their object was to maintain the 1*s.* 4*d.* rate. If that is really so, what is your opinion of that action of the Government?—I should think it would be very rash to judge the Government by the case you put. The Government conceivably might have many reasons for not advancing the money. In the first place, it is a very serious step for the Government to interfere in commercial matters, quite as serious as the suspension of the Bank Act here. They probably thought that the crisis was not sufficient to justify anything like the suspension of the Bank Act, and that they ought not to create a precedent. Remember that the banks at that moment had a considerable amount of Government money in their hands, and probably the Government did not feel justified in giving them any more. Then you have not said whether or not the Bank of Bombay were prepared to pay the Government a reasonable rate for the accommodation. Of course, that is a secondary matter, because I take it that the Government would not have haggled over the terms.

8363. I presume that the Bank of Bombay, being offered 18 per cent., they would have been willing to give 13 per cent. He would be a foolish manager who would not pay 13 per cent. for money that he could lend out again at 18 per cent.?—But cannot you conceive a case where the Government would not wish to be a party to giving money to a bank at 12 or 13 per cent. in order to enable the bank to charge 18 per cent. to their customers?

8364. I can conceive it if it was their policy to maintain their rate at 1*s.* 4*d.*; but if it was their policy to assist the commerce of the country, I think if I had been a member of the Government I should have said, "Here is a bank who are perfectly solvent, "they are so pressed that they cannot lend money to "their customers; we will lend the money to the "bank—the securities being always ample—Govern-"ment paper"?—I agree with you that it is most desirable to assist the commerce of the country, but I do not know whether we are in a position to judge as to the action of the Government, not having the facts before us. I entirely agree with you that it would have been wise for the Government—other things being equal—to have relieved the stringency, because the prosperity of the country and that of the Government are identical. It is the interest of the Government to foster the prosperity of the country by every means.

8365. Is it not the fact that, prior to 1893, the Government did lend more freely to the Presidency banks than they have done recently?—I have not the figures before me; the bank returns would show that at once.

8366. (*Sir F. Mowatt.*) You explained to us that the high rate during the busy season was attributable to the scarcity of currency, and you were asked whether that could not be met by tendering gold to the Goverment, and getting rupees. I think the answer you gave was, because the Government gave a smaller price than could be obtained in the bazaars?—Yes.

8367. But if a man having gold and desiring rupees could get more from the bazaars than he could from the Government, why did not he go to the bazaars?—As a matter of fact he did go there.

8368. But the purpose of this particular man was served, because he got his rupees?—Yes, he got his rupees from the bazaar.

8369. And if he could not get the rupees at the bazaar, he could have got them by going to the Government, unless the price was prohibitive?—He could have got them at the Government price.

8370. Could you tell me how much the bazaar price was below the price charged by the Government?—The price in the bazaars fluctuates day by day. Perhaps Mr. Campbell can tell you.

(*Mr. Campbell.*) The difference would be 1 per cent.

8371. (*Sir F. Mowatt.*) Therefore, the 1 per cent. on his capital is the extreme price that he would have to pay for his rupees?—If he had sacrificed 1 per cent., he would have got rupees from the Government.

8372. I suppose everybody in India has been greatly impressed by the rate going up to 12 and 14 and 20 per cent. in the busy season, but I should like to know how that compares with rates in this country. That is to say, a 10 per cent. rate in India does not correspond with a 10 per cent. rate in this country, does it? The normal rate in India is higher?—That is so; we are not accustomed to such rates here, as in India.

8373. Could you give some sort of comparison? Take it at 3 per cent. in the busy season and 5 per cent. in the slack season—what sort of rates would they correspond with in this country?—I must ask my friend here.

(*Mr. Campbell.*) You may say 2 per cent. as a minumum and 5 or 6 per cent. as a maximum in London.

8374. (*Sir F. Mowatt.*) Would you say that when 13 per cent. was being charged in India it was practically the same as 6 per cent. in London?—Yes.

8375. You said you think that the proportion of Indian trade with gold standard countries and silver standard countries had altered a good deal since the

closing of the mints, that is to say that it had gone from two-thirds to about eight-tenths?—Yes, we have heard that in 1893 the trade with silver using countries was one-third and now it is 20 per cent.

8376. Should you say that that was caused by an increase in the amount of the trade with gold standard countries or an actual falling-off in the amount of trade wieh silver using countries?—It was an actual falling off in the trade with silver using countries owing to the effect of the difference in exchange through the fall in silver.

8377. Not an increase in actual trade with gold standard countries?—I can imagine an increase in the actual trade with gold standard countries without a falling off with silver-using ceuntries.

8378. It would interfere with the proportion?—There are some articles which you export between the two countries which would not go to gold-using countries. For instance, opium would under no circumstances go to gold-using countries.

8379. Does that comparison stand, considering that the comparison before was with a much larger number of silver standard countries and a smaller number of gold standard countries, and the gold standard countries have increased in number, and the silver standard countries have decreased in number considerably during the last 10 or 15 years?—At the present moment, the only country that I can think of is Japan, and she fixed her ratio so low, that it has not had the same effect as it otherwise would have had. Her ratio is fixed at 2*s.* 0½*d.* per dollar.

8380. Do you say that that is the only one?—It is the only one of importance that I can call to mind at the moment.

8381. You said that the development of European influence and capital in China would, no doubt, make her a more serious competitor for external trade than she is at present?—Yes.

8382. Knowing what you do of Chinese institutions and character, do you suggest that that would be felt immediately, or might not even a generation pass before there is any very great increase of active competition?—The competition of China will go on increasing year by year. As we have seen already, during the last 10 years, the trade has increased very largely, and I should look for that increase going on; but it is only, perhaps, as you say, in the course of a generation that it will increase by leaps and bounds.

8383. (*Chairman.*) With reference to the present position of the Japan gold currency, the large export of gold has been caused by the rice famine?—Yes, amongst other things.

8384. Suppose there was a complete failure of the wheat crop in this country, would not there be a large export of gold from this country which would affect, no doubt, the price of money in this country?—Decidedly.

8385. Then, supposing that Japan as a nation—I do not for a moment say that it is so—but supposing she indulged in extravagant or unwise expenditure—expenditure beyond her present means, would not that also tend to cause a drain of gold?—Certainly.

8386. Now, with reference to Chinese competition, I understand that so far as tea is concerned, you consider that the difference which I think you have put at about 36½ per cent. caused by the rise of exchange to 1*s.* 4*d.* was practically met by copper cash having advanced 15 per cent., and also by the taxes—that China was handicapped to that extent—35 per cent.?—Yes. The fall in exchange since the year 1893, when the mints were closed, to the present date, is 36 per cent. The rise in copper cash is 15 per cent. at least, and the duty you may call 15 per cent.; and that neutralizes the effect as compared with India.

8387. In fact, the advantage which China gains by the fall in the bullion price of silver is met, and so to speak balanced, by the increase of 15 per cent. and 20 per cent.?—That is so in the case of tea.

8388. Therefore, practically, you do not attach very much importance to the competition with China, so far as the price of bullion is concerned?—Just so; in the case of tea.

8389. Now, has not the Japan standard, supposing it is maintained, practically fixed the value of the rupee at 11*d.*? The price Japan has fixed for the yen is equivalent to a rupee price of 11*d.*?—I take it that is so.

8390. Then, supposing that the mints were opened, what effect would that have upon the possibilities of a rise or fall in the exchange value of the rupee?—If the mints were opened, I should say the tendency of the rupee would be to fall, to begin with.

8391. To fall below the 11*d.*?—There are so many different factors; it is difficult to speak positively.

8392. I will put it the other way. Could it rise above 11*d.*?—It might rise above 11*d.*, because in the event of India re-opening her mints Japan might have to go back to silver again, and there are many other cases that I could easily conceive that might cause a rise instead of a fall.

8393. Assuming there is no change, the ratio at which the Japanese yen has been fixed would be a barrier against a rise above 11*d.*?—Yes; but only so long as Japan had silver to sell.

The witness withdrew.

Adjourned.

INDIAN CURRENCY COMMITTEE, 1898.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE COMMITTEE

APPOINTED TO INQUIRE INTO THE

INDIAN CURRENCY,

TOGETHER WITH AN

ANALYSIS OF THE EVIDENCE.

PART II.

Presented to Parliament by Command of Her Majesty.

ROYAL ASIATIC SOCIETY LIBRARY OF THE BOMBAY BRANCH OF THE

LONDON:
PRINTED FOR HER MAJESTY'S STATIONERY OFFICE,
BY EYRE AND SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.

And to be purchased, either directly or through any Bookseller, from
EYRE AND SPOTTISWOODE, East Harding Street, Fleet Street, E.C., and
32, Abingdon Street, Westminster, S.W.; or
JOHN MENZIES & Co., 12, Hanover Street, Edinburgh, and
90, West Nile Street, Glasgow; or
HODGES, FIGGIS, & Co., Limited, 104, Grafton Street, Dublin.

[C.—9222.] *Price* 2*s.* 2*d.*

SALE OF GOVERNMENT PUBLICATIONS.

The under-mentioned Firms have been appointed sole Agents for the sale of Government Publications, including Parliamentary Reports and Papers, Acts of Parliament, Record Office Publications, &c., &c., and all such works can be purchased from them either directly or through retail booksellers, who, under the provisions of the sale agency contracts, are entitled to a discount of 25 per cent. from the selling prices:—

IN ENGLAND:—

For all publications *excepting* Ordnance and Geological Maps, the Hydrographical Works of the Admiralty, and Patent Office Publications:—Messrs. Eyre and Spottiswoode, East Harding Street, E.C.

For Geological Maps:—Mr. E. Stanford, Cockspur Street, S.W.

For Hydrographical Works of the Admiralty:—Mr. J. D. Potter, 31, Poultry, E.C.

Patent Office Publications are sold at the Patent Office.

For all Publications *excepting* the Hydrographical Works of the Admiralty and Patent Office Publications.

IN SCOTLAND:—Messrs. John Menzies & Co., 12, Hanover Street, Edinburgh, and 90, West Nile Street, Glasgow.

IN IRELAND:—Messrs. Hodges, Figgis, & Co., Limited, 104, Grafton Street, Dublin.

The following is a list of some of the more important Parliamentary and Official Publications recently issued:—

Parliamentary:

Statutes—

Public General, Session 1896. With Index, Tables, &c., &c. Roy. 8vo. Cloth. Price 3*s.*

Second Revised Edition. By authority. Vol. I. A.D. 1235–1713. Vol. II. A.D. 1714–1800. Vol. III. A.D. 1801–1814. Vol. IV. A.D. 1814–1830. Vol. V. A.D. 1830–1836. Vol. VI. A.D. 1837–1842. Vol. VII. A.D. 1843–1846. Vol. VIII. A.D. 1847–1852. Vol. IX. A.D. 1852–1857. Vol. X. A.D. 1858–1862. Vol. XI. A.D. 1863–1867. Vol. XII. A.D. 1868–1871. Vol. XIII. A.D. 1872–1875. Price 7*s.* 6*d.* each.

Revised Editions. Tables showing subsequent Repeals, effected by Acts of 60 & 61 Vict. 1897. Price 6*d.*

Statutes in Force. Chronological Table of and Index to. Thirteenth Edition. To the end of 58 & 59 Vict. 2 vols. Roy. 8vo. Price 10*s.* 6*d.*

The Statutory Rules [illegible] Temporary Charac[illegible] ...ons of a Local, Personal, or ... Price 10*s.* each.

(ii.)	MINUTES OF EVIDENCE	1

NOTE.—For Part I. of the Evidence, *see* C.—9037 (1898).

ANALYSIS OF EVIDENCE.

RIGHT HON. THE EARL OF NORTHBROOK, G.C.S.I.

Has been connected with Administration of India since 1853, and was Governor-General from 1872 to 1876, 8394.

The Government of India acted rightly in closing the mints to the free coinage of silver in 1893 with a view to establishing a gold standard, 8396, 8419.

The closing of the mints has not seriously interfered with public or private interests in India, 8396, 8489–90, 8544, 8554–9, 8564–74.

The reopening of the mints would be injurious to the people of India, 8397–9.

It would necessitate an increase of taxation which may be estimated at about 7 crores of rupees a year, 8399–406, 8454–6.

To increase taxation in India would be unwise and dangerous, 8407, 8411–6, 8497–501.

Increase of taxation since 1886, 8408.

Grave objections to interference with land revenue, 8410, 8551, 8581–4.

The present artificial system of currency is unsatisfactory, 8417.

Witness, though in favour of a gold standard for India, does not agree with the particular method proposed by the Government of India for establishing it, 8418–21.

An effective gold standard implies a gold currency; but it is not necessary that the token silver currency should be convertible into gold to an unlimited extent. The existing currency notes of high denominations might, however, be made convertible into gold, 8422–5, 8431–6, 8438–40, 8468–73, 8479–88, 8493–6, 8519–34, 8560–3, 8575–80.

Suitability of a gold standard and gold currency for India, 8447, 8475, 8545.

Sovereigns should be made legal tender in India, and should be coined at the Indian mints from gold brought to the mints by the public; it would not be necessary for the Government to accumulate gold for the purpose, 8428–30, 8502–10, 8539–42.

The gold value of the rupee should be fixed at 1*s.* 4*d.*, 8437, 8457–66, 8474, 8509–17, 8543.

Witness is in favour of the grant by the Imperial Government of assistance to India for the purpose of making a gold standard effective, 8439, 8442–3.

Is opposed to the imposition of a heavy import duty on silver, 8444–6.

The present is a favourable time for introducing an effective gold standard, 8448.

Importance of steadiness in management of finances of India, 8449, 8546–50.

The establishment of an effective gold standard in India would not render impossible an arrangement in the future with France and America, 8449, 8492.

Relation between Government of India and Presidency Banks, 8450–1, 8535–8.

MR. WILLIAM JAMES THOMPSON, SENIOR, AND MR. WILLIAM JAMES THOMPSON, JUNIOR.

Have been in business for many years as tea-brokers in Mincing Lane; Mr. Thompson, Senior, is Chairman of the National Discount Company, 8585–90.

Prices in London of Indian, Ceylon, and China tea from 1883–84 to 1897–98, 8591.

In consequence of the superior strength and quality of tea from Ceylon and India, as compared with that from China, the imports of the former into Great Britain have rapidly increased, and those of the latter have fallen away, 8592–7, 8620–1, 8652–3, 8673–7.

The superiority in quality of Indian and Ceylon tea over China tea is in part due to the difference in the plant, and perhaps in part to superior soil, 8622–3, 8651–6.

An increase in the importation of China tea is, however, possible, 8671–2.

The fall in the price of tea has been due to circumstances affecting supply and demand, 8598–9, 8611–2, 8641–5, 8660–5.

MR. WILLIAM JAMES THOMPSON, SENIOR, AND MR. WILLIAM JAMES THOMPSON, JUNIOR—*cont.*

The markets for Indian and Ceylon tea, outside the United Kingdom, are Australasia, North America, and Russia. In Australasia the demand is now very large, and in Russia it is growing considerably, 8600–9.

The supply of Indian and Ceylon tea will probably continue to increase, but not so rapidly as hitherto, 8613, 8640, 8666–7.

The rise in exchange has for the time affected profits and checked production, but a fall in exchange might lead to over-production and cause a fall in price, 8615–8, 8624–35, 8646–50, 8668–70, 8678.

MR. W. H. CHEETHAM.

Is a member of the firm of Kilburn and Co., Calcutta, which is interested in several branches of industry, 8679–80.

Was strongly opposed to the closing of the Indian mints in 1893, 8682.

Opinion in commercial circles in India as to closing of mints, 8683, 8779–87.

Effects of closing of mints:—

(1) Monetary stringency:

Insufficiency of currency has caused, and is still causing, monetary stringency in India, 8710–8, 8727–8, 8772, 8791, 8793, 8795, 8888–904, 8991–9014; whereas, when the mints were open, stringency was relieved by the importation of silver, 8729–31, 8964–72, 9008–11.

Injurious effects of monetary stringency on Government securities and on industrial securities and enterprise, 8772–7, 8860–7, 8886–7, 8981–90.

Effect of stringency on cotton-spinning and other manufacturing industries in India, 8727, 8792–4, 8888–96, 8931–3.

Stringency felt in Behar and Central India, 8720–1.

Stringency not felt by agricultural classes, 8934–6

(2) Effect on cotton-mills in India, China, and Japan, of rise in the exchange value of the rupee and fall in silver, 8738–44, 8768–71, 8912–30, 8973–80.

(3) Effect on Indian opium trade of rise in value of rupee and fall in silver, 8745–6.

Witness is in favour of re-opening the Indian mints, 8685–6, 8789.

Effects of re-opening the mints:

Would raise the value of silver, 8688–92, 8702–6, 8790, 8884–5.

Would establish confidence, 8872–3.

Would ultimately steady exchange, 8707–9.

Effect on prices and wages in India, 8839–54.

The loss to Government caused by re-opening the mints might be met by temporary borrowing or temporary additional taxation, 8694–8, 8824–39, 8856–9, 8874–7.

Gold Standard for India:—

Desirable, but impracticable, 8756–9, 8800–4, 8937–43.

If convertibility were established, rupees would be taken out of hoards, and gold would be hoarded in their place, 8759–64, 8805–23, 8878–83, 8944–56.

Financial position of India before the closing of the mints, 8765–7.

Effect of falling exchange on production and export trade, 8733–7, 8905–11.

Tea-planting industry:—

Competition between India and China, 8747–9, 8797–9.

Depression in the tea-trade caused by over-production and accentuated by rise in exchange, 8796.

Alleged prevalence of illicit coinage in India, 8957–63.

Currency and prices in China, 8750–4.

Relative stability of silver and gold in relation to commodities, 8755.

Analysis.

MR. DONALD GRAHAM, C.I.E.

Is a merchant trading with India, 9015–20.
Was present during examination of Mr. W. H. Cheetham, and is in general agreement with his evidence, 9021–2.
Was opposed to the closing of the mints in 1893, 9023–6.
Grounds of objection to the closing of the mints:—
- Fall in the rupee price of silver ornaments, 9027–34, 9200–16.
- Undue stress was laid on the difficulties of Government, and too little thought was given to the interests of the people, 9034–7, 9144–8, 9301–14.
- The fall in exchange prevented suffering which would otherwise have resulted from fall in prices, 9037.
- Difficulty of procuring a sufficient reserve of gold to make a gold standard effective, 9037, 9089–93.
- Special disadvantages of an artificial system of currency in India, on account of alternating seasons of active and slack trade, 9037.
- Opposition of natives of India, 9037.

Events have justified the objections to the closing of the mints, 9038.
The chief evil brought about by the closing of the mints is monetary stringency, 9040–1, 9068–76, 9130–2, 9189, 9227, 9334 (*note*).
It is quite possible that there may not be in the busy season of 1898–9 as great a stringency as in 1897–8, 9077–9.
India needs a free, large, cheap, and abundant currency, 9064–5.
A falling exchange stimulates exports, 9084–5, 9150–67.
If the rupee fell below a certain point, the fall would cease to be advantageous to India, because the rupee would no longer be suitable for the wants of the people, 9065–7.
Alleged effects of fluctuations of exchange in encouraging speculation, 9107–8, 9236.
Difficulty at present time of making forward contracts for exchange, owing to uncertainty of money market, 9109, 9136–43, 9234–6.
Mints should be gradually re-opened, 9039–40, 9252–60.
Effects of re-opening the mints:—
- Additional taxation would be necessary, at least for a time, 9042–3, 9046, 9149.
- The yield of existing sources of revenue would automatically increase, 9047–9, 9174–93, 9231, 9291–6.
- Import duties and export duties, 9050–3, 9114–5, 9118–21, 9232–3.
- Death duties, 9054, 9123–6.
- Railway rates might be raised, 9056–7, 9127–9.
- The country at large would benefit, 9043–5.
- Exchange would become more stable, because the causes which broke down the price of silver have now worked themselves out, 9059–63, 9168–9, 9218–27, 9297–300.
- Prices would rise, 9052–3, 9058, 9161–8, 9170–3, 9194, 9237–42, 9322–34.

Prices in India do not appear to have risen materially since the fall in silver began; but this is due to the fall in gold prices, 9080–3, 9088, 9165–8.
Gold standard:—
- Impracticable owing to difficulty of procuring sufficient supply of gold, 9089–93, 9261.
- If practicable, would be in some respects advantageous, 9269–77.
- The practical difficulties would be lessened if the rupee were rated lower than 1*s.* 4*d.*, 9262–8, 9278–90.

Council bills, method of sale, 9094.
Volume of rupee currency, 9103–6.
Imports of Manchester goods into India, 9133–5.

MR. DAVID CRUICKSHANK.

Is chairman of the Indigo Association, and a member of a firm trading with India, and especially interested in indigo and tea, 9335–6.
Was opposed to the gold standard proposals of 1886, and to the closing of the mints in 1893, 9337–8.
Chief ground of objection to the closing of the mints was that a divergence between the intrinsic value and the exchange value of the rupee would be prejudicial to the export trade of India, 9339–42.
Effects of the closing of the mints:—
- Reduction of profit on tea and indigo, and restriction of production, 9343–66, 9405–20, 9437–98, 9562–8, 9586–604, 9608–19, 9652–71.

MR. DAVID CRUICKSHANK—*cont.*

- Effect on prices and wages in India, 9452–86, 9550.
- Monetary stringency, 9370–6, 9380–2, 9428–30, 9463–4, 9467, 9488, 9491–5, 9605–7.
- Severe stringency anticipated in 1898–9, 9377–9.

Effect of high exchange in stimulating imports, especially of cotton goods, sugar, and salt, 9400–4, 9569–83, 9633–41, 9698–718.
Effect of low exchange in stimulating exports and production, 9509–34, 9551–61, 9620–32, 9642–6.
A fall in exchange is advantageous to India, but the limit of advantage is reached when a general rise of prices takes place, 9390–1, 9551, 9662–9, 9675–9.
Prices in India from 1873, 9535–49, 9552–6, 9680–90.
Stability of exchange is desirable, provided that the rate fixed for the rupee is not too high, 9383–4, 9391, 9651.
The gold standard proposals of the Government of India are objectionable, because the rate of 1*s.* 4*d.* for the rupee is so high as to hamper the export trade, 9385–9.
If a rate of 1*s.* 2*d.* were chosen instead of the proposed rate of 1*s.* 4*d.*, a gold standard could probably be established without any special measures for the acquisition of gold, 9391, 9395, 9422–7, 9647–50, 9695–718.
If exchange were fixed at 1*s.* 2*d.* instead of at 1*s.* 4*d.*, the revenues of the Government of India would expand owing to the growth of trade, 9396–7.
If the natural expansion of revenue were insufficient to meet the additional charges involved in the lowering of exchange, the import duties might be increased, 9397–9, 9584–5.
Competition of China with India and Ceylon in tea, and of China with India in cotton, 9597–604, 9642–6.
Competition of America with India in cotton, 9672–9.
Illicit coinage, 9421.

MR. MERWANJEE RUSTOMJEE.

Is a Parsee broker, dealing in exchange, finance, bullion, and Government securities, and represents the Bombay Native Shares, Stock, and Exchange Brokers' Association, 9719–21.
Was opposed to the closing of the mints, on the ground that India was prospering under the silver standard, and that, if the mints were closed, Indian cotton-mills would be injured by the fall in silver and by monetary stringency, 9722–3, 9732.
The closing of the mints has failed to attract gold to India, though circumstances have been such as to favour the policy of the Government, 9724.
The adoption of the proposals made by the Government of India in March, 1898, would be injurious to India, because the stringency in the money market would be intensified, 9725.
Monetary stringency in Bombay from January to March, 1898, and its effects, 9726, 9739–45, 9759–94, 9823–8, 9832–54, 9863–5.
Stringency in 1898–99 will probably be less severe than in 1897–98, 9757–8.
Witness is in favour of a gold standard and of a gold currency, with the rupee at 1*s.* 2*d.*, to be established with Imperial guarantee and assistance, 9728–31, 9737–8.
Advantages of the rate of 1*s.* 2*d.* for the rupee as compared with 1*s.* 4*d.*, 9729, 9746–50.
The limit of 1*s.* 4*d.* now fixed has the effect of steadying exchange, 9829–31.
Immediate coinage of gold would relieve the monetary stringency, 9731.
Failing an effective gold standard, witness is in favour of re-opening the mints to silver, 9732.
Public feeling in India on the currency question, 9814–8.
If the mints were re-opened to silver, the loss to Government could be met by reduction of expenditure, or additional taxation, or by both means, 9733–4, 9753–5.
Objections to increasing the import duty on silver, 9735.
Effect on Indian cotton-mills, and on Indian trade and competition with China, of variations in exchange between India and China, 9736.
Alleged connexion between the import [redacted] India and illicit coinage, 9795–813; 98[redacted]

MR. JOHN GALLOWAY.

Is President of the Glasgow Chamber of Commerce, but gives evidence in his private capacity. Was connected with a steamship company trading between Glasgow and Rangoon, and with the Irrawady Flotilla Company, 9869–70, 9877–9, 9898.

Division of opinion in the Glasgow Chamber of Commerce on the Indian currency question, 9871–7.

Witness approves of the closing of the Indian mints, on account of the disadvantages to trade that were caused by the fluctuations in exchange, 9880–4.

Effect on Indian import and export trade of the fall in the exchange value of the rupee, 9885–97.

The Irrawady Flotilla Company has not been able to raise its rates while the exchange value of the rupee has been declining, 9900–1, 9997–10,007.

Slight effect of monetary stringency since closing of mints on trade of Burma, 9902–9, 9976–9.

Use of precious metals in Burma, 9910–1.

Effect on trade of India with China, Japan, and the Straits Settlements, and on competition between India and China, of the adoption of a gold standard for India, 9913–6.

Desirability of gold standard and gold currency for India, 9917–24.

Rate of 1*s.* 4*d.* for the rupee is fair and practicable, 9960–75, 10,019.

Probable effect on trade of India and of the United Kingdom the reopening of Indian mints, 9933–6.

Opinion of manufacturing firms in the West of Scotland as to disadvantages arising from instability of exchange between India and gold-using countries, 9947–8, 9994–5.

Effect of variations in exchange on the jute industry in India and Scotland, 9948–55, 9980–1, 10,015–8.

Effect of proposed export duties on jute and tea, 9937–43, 9987–8.

Effect of unstable exchange on the prosperity of the South American States, 9926–32.

SIR ROBERT GIFFEN, K.C.B.

Has been Assistant Editor of the *Economist*, and an official under the Board of Trade, 10,020–4.

Was in 1879 a member of a Departmental Committee appointed to consider a proposal for closing the Indian Mints to the free coinage of silver; and wrote two memoranda on the subject, 10,025–31.

The opinion expressed by witness in 1879, in opposition to the views of the Government of India, viz., that no further fall in silver was then probable, was justified by the circumstances of the time, and has been justified by the event, 10,032–43, 10,138–51.

Objections to the policy put forward by the Government of India in 1878 and 1892 of closing the mints to the free coinage of silver with a view to the ultimate establishment of a gold standard:—

(1.) Disadvantage of an artificially managed currency, as compared with an automatic metallic currency, 10,049, 10,323–6.

(2.) Difficulty of maintaining the exchange value of an artificially managed currency, 10,049, 10,082–9.

(3.) Uncertainty as to the duration of the transition stage that must precede the establishment of a gold standard, 10,049.

(4.) Contraction of currency for the purpose of maintaining its exchange value can seldom be carried out without producing monetary stringency, 10,089.

(5.) Difficulties of India through fall in exchange may be due (*a*) to increase in value of gold, (*b*) to decrease in value of silver. In the first case there is a real increase in the burden of foreign obligations, which is not alleviated by an artificial rise in the exchange value of the rupee. In the second case there is no increase in the burden of foreign obligations, and the additional number of rupees required by the Government can be obtained by increasing the nominal amount of taxation, 10,050–9.

(6) Indian officials are mistaken in thinking that, while the real amount of taxation can be increased by raising the value of the currency, it cannot be increased by the imposition of new taxes or by raising the nominal amount of existing taxes, railway rates, &c., 10,060–80, 10,350–6.

(7.) The deficit that would occur in the accounts of the Government of India owing to the re-opening of the mints would be reduced, probably, by 3,000,000*l.* or 4,000,000*l.* annually, if the Imperial Government dealt fairly with India in the apportionment of military and other expenditure, 10,082, 10,183–91.

(8.) The Government of India is too anxious to meet a deficit immediately, instead of waiting for the natural growth of revenue, 10,080–2, 10,167–77.

Motives that induced the Government of India to abandon the silver standard, 10,259–61, 10,364–72.

Gold standard:

Unsuitable for India because, whatever the standard, the currency would be chiefly silver, 10,091, 10,106–8.

Disadvantages consequent on the use of different metals as standard and currency, respectively, 10,091–104, 10,203–11, 10,227–8, 10,236–7.

Amount of gold that would probably be used as currency in India, if gold standard and currency were introduced, 10,106–8.

Economic and financial conditions of India affect the question of the possibility of maintaining the gold standard, 10,109–13, 10,238–48, 10,333–45.

Output of, and demand for, gold, 10,114–7, 10,311–6.

A rise in the exchange value of the rupee to 1*s.* 4*d.*, or above 1*s.* 4*d.*, might fail to attract gold to India for currency purposes, 10,118–26, 10,192–202.

If the Government undertook to give a larger number of rupees in exchange for a sovereign than it now offers, gold would be more likely to flow into the Currency Department, 10,266–70, 10,276–8.

Alleged redundancy of currency in India, 10,121–5.

Objections to Mr. Lindsay's scheme, 10,127.

If the Government of India were prepared to make the rupee convertible into gold, many of the objections to their proposals would vanish, 10,205–26, 10,292–310.

Method by which gold should be acquired, if it were decided to establish a gold standard in India, 10,263–75, 10,279–81.

Nature and limits of advantages resulting from stability of exchange between India and gold-standard countries, 10,249–59, 10,370–1.

Effect of rate of exchange on prices in India, 10,282–90, 10,318–22.

Re-opening of the mints is the least disadvantageous of the courses open to the Government of India, 10,128–37.

Objection, on the ground of expense, to the proposal for increasing the amount of silver in the rupee, 10,134–6.

Comparative steadiness of silver and gold as standards of value, 10,131–3, 10,229–35.

SIR ALEXANDER MACKENZIE, K.C.S.I.

Served for 36 years in the Indian Civil Service, and was Lieutenant-Governor of Bengal from December 1895 to April 1898, 10,373–6.

Necessity for closing the Indian mints in 1893, 10,407–9.

The closing of the Indian mints was not followed by any scarcity of currency in the interior of Bengal; there has been no permanent rise in the rate of interest; nor have tenants shown any preference for paying their rents in kind rather than in cash, 10,377–85, 10,396, 10,398, 10,494–503, 10,576–9.

The land revenue was paid punctually in Bengal in the famine year, 10,385, 10,405–6.

Comparison between the last famine and previous famines, 10,386–90.

Witness has not heard of complaints made during the famine on account of the fall in the rupee price of silver ornaments, 10,391.

Use of silver, gold, and other ornaments in Bengal, 10,391–2, 10,394–5, 10,584–6.

Hoarding of rupees in Bengal, 10,391, 10,393, 10,587–97.

Use of copper currency in Bengal, 10,397–8, 10,401–3.

Re-opening of Indian mints would necessitate a considerable increase of taxation, 10,410–2.

The existing taxation is as much as the country can properly bear; and an increase of taxation would involve the risk of political disturbances, 10,413–6.

Analysis.

SIR ALEXANDER MACKENZIE, K.C.S.I.—*cont.*

Difficulty of finding new sources of taxation, 10,417, 10,430-1.
Difficulties and objections in the way of increasing the amount obtained from existing sources of revenue, 10,417-45, 10,504-7, 10,519-21, 10,553-5, 10,598-606.
Increase of taxation in India since the fall in the value of the rupee began, 10,443-4.
Criticism of proposals for reduction of expenditure of the Government of India, 10,446-58, 10,607-9.
Interest of the Government of India, and of the official classes, in stability of exchange, 10,459, 10,461, 10,512-8.
Stability of exchange necessary for the attraction of private capital to India, 10,459, 10,487-91, 10,546-50.
Condition of the Indian tea-planting industry, 10,462-75, 10,530-44, 10,560-1.
Condition of the indigo trade, 10,562-4.
Suitability of rate of 1*s.* 4*d.* for the rupee, 10,476-83, 10,565-75, 10,580.
Alleged difficulties in the way of the introduction of a gold currency into India, 10,402, 10,484-6.
Alleged effect of low exchange in stimulating the growth of non-food crops in Bengal in preference to food crops, 10,490, 10,556, 10,559-61, 10,581-3, 10,622-3.
Illicit coinage, 10,492-3, 10,614-8.
Movements of prices and wages in India, 10,501-3, 10,508-11, 10,545, 10,557-8, 10,619-21, 10,626-7.
Movements of capital to, and from, India, 10,460-1, 10,546-52.
Effect of falling exchange on export trade, 10,611-3.

MR. ROMESH C. DUTT, C.I.E.

Was in the Indian Civil Service from 1871 to 1897, 10,628-33.
Effects of the currency policy of the Government of India:—
(1.) Increase in the real burden of taxation owing to the appreciation of the rupee, 10,638-42, 10,660-70, 10,691, 10,761, 10,885-911.
(2.) Increase of the indebtedness of the agricultural classes, 10,674-8, 10,680-90.
(3.) Fall in the rupee price of silver ornaments, 10,692-8, 10,818-20, 10,824-30, 10,841-58, 10,865-76, 11,005-9.
(4.) Increase in the real burden of the rupee debt of the Government of India, 10,699-702.
(5.) Increase in the real value of official salaries, 10,703-6.
(6.) Injury to trade and manufactures of India, 10,707-9, 10,791-6.
As exchange falls, the revenue of Government, as measured in rupees, increases, 10,643-7, 10,649-50, 10,652-3, 10,659, 10,664-8, 10,672-3, 10,912-40, 11,019-26.
The Government would be justified in raising the salt duty and the excise duty, because the yield of these taxes does not increase automatically with the fall in exchange, 10,656-9.
Effect of variations in exchange on prices and wages in India, 10,646, 10,648-55, 10,668-70, 10,679, 10,859-64, 10,943-69.
Hoarding of rupees and of uncoined silver, 10,694, 10,853-8, 10,878-84.
Remedies for the financial difficulties caused by the fall in exchange:—
Increased employment of native officials, 10,710-3, 10,983-11,004.
People of India should be consulted by Government on financial questions, 10,727, 10,769-70.
Reduction of India's sterling obligations, 10,714-27.
Witness is in favour of letting the rupee fall to its bullion value, because the additional charges that would be incurred could be met from the automatic increase in the revenue of the Government and by more economical administration, 10,747-8, 10,767-8.
Proposed temporary borrowing to meet charges of external debt, 10,764-6.
Criticism of railway policy of Government of India, 10,728-42, 10,799-805, 10,971-80.
Possibility of raising railway rates, 10,751-60.
Gold standard not desired by the producing and cultivating population of India, 10,832-5.
Feeling in India as to present inquiry, 10,774-90.
Price of silver and cost of production, 10,806-17.
Illicit coinage, 10,8[illegible]17.

RIGHT HON. SIR JOHN LUBBOCK, BART, MP.

Is Chairman of the London Bankers, and President of the Central Association of Bankers; was a member of the International Currency Commission and of the Gold and Silver Commission, 11,027-9.
Was not in favour of the closing of the Indian mints, 11,030-1, 11,138-41, 11,153.
Temporary borrowing would have been preferable to closing the mints, 11,077.
A gold standard is impossible without a gold currency, 11,033, 11,035, 11,041-2, 11,100. 11,102, 11,109.
Gold currency unsuitable for India, 11,032, 11,040, 11,106-7.
A currency of which a portion is gold and the larger portion is silver, cannot be rightly described as a gold currency, 11,033, 11,109, 11,136-7, 11,212.
France and Canada have not a gold standard, but an exchange standard, 11,034, 11,036-8, 11,110-4.
India has at the present time an exchange standard, 11,043.
Definition of "exchange standard," 11,048.
Disadvantages of an exchange standard, 11,049, 11,130.
Desirability of altering the present currency arrangements of India, 11,095-7, 11,144.
Criticism of the proposals made by the Government of India, 11,097-8.
Criticism of Mr. A. M. Lindsay's proposals, 11,099.
It would not be wise for the Government of India to undertake to give gold for rupees, unless after a very great reduction of the volume of the rupee currency, 11,117-33, 11,165-77.
The rate of 1*s.* 4*d.* for the rupee can probably be maintained without recourse to extreme measures, 11,217-8.
Having regard to present conditions, witness is in favour of maintaining the value of the rupee by the imposition of a heavier import duty on silver, of a fixed amount per ounce, 11,055, 11,057-8, 11,158-62, 11,196-7, 11,203-8.
Effects of this policy:—
Increased revenue, 11,055, 11,159.
Increased demand for Council bills, 11,055, 11,192.
Rise in rupee price of silver; diminution of difference between value of rupee and value of same weight of uncoined silver; divergence between value of silver in India and outside India, 11,055, 11,059-65, 11,068-70, 11,162-4, 11,190-1.
Re-opening of mints:—
With a heavy import duty on silver and a seignorage, it might ultimately be possible to re-open the mints, 11,056, 11,084, 11,142, 11,154-7, 11,202.
Effect on price of silver of re-opening the mints, 11,084-94, 11,155-7, 11,190-2.
With open mints, under the conditions proposed, the rupee would fluctuate much more closely with silver than it does at present, 11,185-9, 11,198-9.
A stable exchange is desirable, but its importance has been exaggerated, 11,050, 11,071, 11,186.
Suggestions as to land revenue, 11,078-80, 11,149-51.
Effect of fall in exchange on sterling and rupee obligations of Government of India, 11,081-3.
Railway policy of Government of India, 11,095, 11,219.

MR. HENRY BOIS.

Resided in Ceylon for nearly 40 years, and was a member of the Legislative Council and Chairman of the Chamber of Commerce of Ceylon, 11,234-7, 11,261.
Agrees with the evidence given by Mr. T. N. Christie, so far as it relates to matters of fact; but does not agree with all Mr. Christie's opinions and suggestions, 11,238-9.
Witness is in favour of the re-opening of the mints to silver, 11,280-1.
If the mints were re-opened, a duty on exports would be a better means of providing the additional revenue required by the Government than an import duty on silver and a seignorage as proposed by Mr. Christie, 11,243-54, 11,296.
Although India and Ceylon have hitherto benefited from a low exchange, that benefit would be lost if the rupee were to depreciate relatively to food, labour, and commodities generally, 11,240-1.
Effect on the Ceylon tea industry of the maintenance of exchange at 1*s.* 4*d.*, 11,255-9, 11,292-5, 11,302-3.
Importance of the tea industry to Ceylon, 11,261-8.
Fall in price of tea due to increased production, 11,294-5.

MR. HENRY BOIS—*cont.*

Loss and gain to various classes and interests arising from fall in exchange, 11,260, 11,272–3, 11,276–7, 11,329–31, 11,334–7.
Effect of high and low exchange on movements of capital, 11,272–3.
Rate of exchange that would have prevailed if the mints had not been closed, 11,274, 11,326–8.
If the mints are not re-opened to silver, a gold standard might be established with the rupee at 1*s.* 2*d.*, and this would probably be accepted in Ceylon as a fairly satisfactory solution of the currency question, 11,281–7.
Method of establishing a gold standard in India and retaining the rupee as the chief circulating medium, 11,287, 11,289–91, 11,306–24.
Advantages of a gold standard, 11,304–5.
Amount of gold required for the establishment of a gold standard in India, 11,287.

MR. HORACE SEYMOUR, C.B.

Is deputy master of the Royal Mint, 11,338–9.
History of the adoption of the gold standard, with token currency of silver and bronze, in England, 11,340–60, 11,449–62.
Value of silver coinage in relation to gold is fixed by proclamation, 11,353.
Proportion of intrinsic to circulating value of English silver coins, 11,377.
Silver coins issued under the authority of the Chancellor of the Exchequer, at the request of the Banks of England, Scotland, and Ireland, 11,363–74, 11,436–7.
Profit on the coinage of silver goes to the Government, 11,375–6, 11,438–46.
Any loss resulting from over-issue of silver would be borne by the banks, 11,378–9, 11,513–5.
Estimate of active circulation in the United Kingdom: gold, 68,000,000*l.*; silver, 23,000,000*l.*; bronze, 2,000,000*l.*, 11,383–410, 11,469–75.
Principles by which the issue of token coins is regulated in foreign countries, 11,411–23.
Circulation of five-franc pieces in France, 11,420–3.
Question whether value of token coins can be maintained by limitation of issue, apart from limitation in respect of legal tender, 11,424–8, 11,491–2, 11,522–7.
Decrease of illicit coinage in the United Kingdom in spite of fall in the value of silver, 11,430–5, 11,463–8.
Difficulties in the way of illicit coinage, 11,510–2.
Possibility of detecting illicit coins made of silver, 11,505–9, 11,517–8.

MR. ROBERT BARCLAY.

Is a partner in firms established at Manchester, Buenos Ayres, and Monte Video; has large business relations with India; is President of the Manchester Chamber of Commerce, 11,528–32.
Appears before the Committee mainly in order to support a resolution passed by the Manchester Chamber of Commerce in favour of re-opening the Indian mints to the coinage of silver, at a time and under conditions to be hereafter determined, 11,533–4, 11,580, 11,708–9, 11,739–49.
Criticism of the policy of establishing a gold standard, as proposed by the Government of India:—
  Objection to a gold standard without a gold currency, 11,535.
  A gold standard with a gold currency could not be introduced, because a gold currency is unsuitable to India and would not be accepted by the people, 11,535–6, 11,624–5, 11,700–1, 11,719–20.
Criticism of Mr. A. M. Lindsay's scheme:—
  Without unlimited convertibility of the rupee into gold, there would be no assurance that exchange would be kept at 1*s.* 4*d.*; with unlimited convertibility the demand for gold might be so great as to cause the scheme to break down, 11,536–41.
The Government of India and Mr. Lindsay aim at keeping up the rate of exchange, and ignore, to a large extent, the interests of the people of India, 11,541–5.
The rate of exchange has been kept up in recent years by Government borrowings and by investment of capital in India, 11,537–40.
The establishment of a steady rate of exchange would be advantageous to India, if it were brought about in such a way as to inspire confidence in its continuance, 11,574–7, 11,640.

MR. ROBERT BARCLAY—*cont.*

The currency of India should be automatic, and should not be controlled by the Government with a view to the maintenance of the rate of exchange, 11,545, 11,548–9, 11,558, 11,560–5, 11,626–36, 11,657.
Effect of the suspension of the sale of Council bills in 1893, 11,550–8.
When the mints were open, trade balances could be adjusted by the export or import of silver, 11,545–6, 11,565, 11,618.
Effect on the Indian money market of the curtailment of the currency caused by the closing of the mints, 11,566–74.
Use of credit money in India, 11,580, 11,701–4.
Effect of the closing of the mints on the rupee price of silver bullion and ornaments, 11,580–4, 11,590–8, 11,612, 11,614, 11,641–5.
Estimate of the amount of uncoined silver in India, 11,659.
Effect of the closing of the mints on the value of hoards of rupees, 11,585–90, 11,593–6.
Feeling in India as to the closing of the mints, 11,598, 11,605–10, 11,660–3, 11,666, 11,721–3.
Effect of the closing of the mints on Indian trade and competition with China, 11,686–7.
Witness sympathises with the desire of the Government of India for the establishment of a stable exchange between India and gold-using countries at the rate of 1*s.* 4*d.* for the rupee, 11,598, 11,749–51.
If the Indian mints were re-opened to the free coinage of silver and, at the same time, concurrent mintage of silver by the United States on the basis of 42*d.* per oz. were secured, the object of the Government of India would be attained, 11,598, 11,646–9, 11,705, 11,711–3.
Further advantages which would result from the proposed arrangement, viz.:—India would have a supply of currency adequate to her needs, she would have the same standard as China and other Eastern competitors, disturbance of the habits of the people in connexion with currency would be avoided, the divergence between the value of coined and uncoined silver would disappear, and the temptation to illicit coinage would be diminished, 11,598, 11,688, 11,715–6.
Reasons for believing that such an arrangement could be brought about and would be effective, 11,650–6, 11,699.
Views of witness as to prevalence of illicit coinage in India, 11,688–98.
Importance of the trade of Lancashire with India, 11,657–8.
Coinage in Native States, 11,667–84.
Attempts to establish a gold standard in Russia, Austria, Japan, Chili, and Peru, 11,685.
Condition of the Argentine Republic during fall of exchange, 11,752–6.

PROFESSOR ALFRED MARSHALL.

Is Professor of Political Economy in the University of Cambridge, and gives evidence on questions of economic principle, 11,757–8.
Relation between volume of currency and level of prices, 11,759–60, 11,799.
Other causes affecting prices, 11,760–2.
Relation between currency, bank money, and real capital, 11,763–4, 11,794–8, 11,800.
Causes governing the rate of interest and the rate of discount, 11,765–9, 11,794, 11,802–13, 11,852.
Alleged influence of custom in steadying prices in India, 11,770–2.
Dependence of India on foreign capital, 11,773, 11,814.
Want of elasticity in Indian currency; not to be avoided by a mere increase in the currency; the methods of the German Reichsbank might be followed, 11,773–9, 11,852.
Classes affected by a rise or fall in prices; relation between movements in wages and movements in prices, 11,780–5.
Interest of the Government of India in the rate of exchange; growth of Indian expenditure due to moral and material progress; importance of raising revenue in the least irritating manner possible. 11,786.
Reasons for approving of the rate of 1*s.* 4*d.* for the rupee, 11,787, 11,834–6.
Rate of Indian exchange indicates proportion between rupee prices and sterling prices, certain allowances being made; causes acting on rate of exchange, 11,788–91, 11,824–7.

Analysis.

PROFESSOR ALFRED MARSHALL—*cont.*

Alleged effect of depreciation of currency in stimulating foreign trade, 11,792, 11,815–22, 11,834–44, 11,850–1.
Possibility of establishing and maintaining a gold standard and gold currency in India, 11,793, 11,829, 11,845–6.
Alleged effect of import duties in enabling a debtor country to retain gold, 11,828–9.
Need for more thorough economic training of Indian administrators, 11,852.

MR. ALFRED DE ROTHSCHILD.

Suggestions as to the establishment of a bank in India to absorb the existing Presidency Banks, and to provide for the creation of a gold reserve and for the maintenance of a gold currency, 11,853.

MR. WALTER DUNCAN.

Is a merchant engaged in Indian trade, 11,854–8.
Disapproved of the closing of the Indian mints on the ground that the rise in the value of the rupee must be a burden to the export trade, 11,860–3.
Difficulty of tracing any effect of exchange on prices, 11,864–7.
If exchange had been allowed to fall, prices would probably have risen in course of time, 11,872–4.
Classes affected by rise in prices, 11,875–9.
Desirability of reducing the exchange value of the rupee from 1*s.* 4*d.* to 1*s.* 1½*d.*, 11,880–5, 11,916–21, 11,928–30, 11,946, 11,949, 11,952–5.
To re-open the mints at once would cause disaster to traders and difficulty to the Government of India, 11,914, 11,928.
Probability of a rise in the gold price of silver, 11,920, 11,931–9.
India cannot compete with other countries if her exports are burdened with a rate of exchange artificially raised to 1*s.* 4*d.*, 11,886–900, 11,940–3.
Condition of Indian import and export trade since closing of mints, 11,922–7, 11,982–98.
Competition between India and China, 11,896–906.
Opium trade, 11,900, 11,966–73.
Advisability of increasing import duties to meet the loss that the Government of India would suffer if the rate of exchange were reduced, 11,907–11.
Probability that, with a lower rate of exchange, the revenues of the Government of India would expand, 11,957–8.

MR. J. E. O'CONOR, C.I.E.

Opium trade:
The chief cause of the low price of Bengal opium in 1897 was the stringency of the money-market. Since 1897 prices have risen and the quantity exported has increased, 12,010–4.

Further evidence in support of the view that the currency policy of the Government has not excited popular dissatisfaction in India, 12,015–7.

Illicit coinage:
The enquiries of the Government of India show that there is no evidence of illicit coinage on any appreciable scale, 12,018, 12,020–1.
Confirmation of this view from other sources, 12,019.
Methods of illicit coinage in India, 12,019.
Currrency of Native States:
Decrease in the issue of fresh coinage by Native States, 12,022–3.
Substitution of British rupees for native coins in Kashmir, Gwalior, and Bhopal, 12,024–42.

Indian trade:
Condition of trade in 1898–9 is not abnormal, 12,043–8, 12,097–116.
Possibility of the maintenance of the rate of 1*s.* 4*d.* for the rupee, 12,049–55.
Effect of rate of exchange on trade and prices, 12,117–23, 12,150.
Elasticity of Indian export trade, 12,139–41.
Trade of India with the Straits Settlements, 12,056–9.
Trade with China, 12,060–76.
Rate of exchange between India and China since the closing of the mints, 12,134–8.
Trade with Japan, 12,070, 12,073.
Competition with the Argentine Republic in wheat and oil-seeds, 12,155.
Effect of railways on trade, 12,141–2.

MR. J. E. O'CONOR, C.I.E.—*cont.*

Movements of prices in India, 12,143–51.
Competition of Indian and Ceylon tea with China tea, 12,152–3.
Taxation:
Objections to the policy of regulating taxation with reference to the rate of exchange, 12,077.
Increase of taxation since 1873, 12,077.
Proportion of home charges incurred on account of general administration and "commercial services," respectively, 12,078–5, 12,087.
Difficulties in the way of increasing railway rates in India, 12,085.
Purchase of stores in England and India, 12,085–9.
Explanation of the "exchange" shown in the accounts of the Government of India, 12,090–4.
Form of the accounts of the Government of India, 12,090–6, 12,124–33.

RIGHT HON. THE LORD FARRER.

Was a member of the Indian Currency Committee of 1893; and is satisfied, from subsequent experience, of the justice and expedience of the course recommended by that Committee and adopted by the Government, 12,157–60.
Bimetallism, as a solution of the Indian Currency question, is now impracticable, 12,162.
The re-opening of the Indian mints would be injurious to trade and ruinous to the finances of the Government, and would not alleviate monetary stringency, 12,164–9, 12,287.
The existing currency arrangements of India should be terminated as soon as possible, 12,170–2.
A gold standard should be adopted with an automatic currency based on gold and having a fixed gold value, 12,173–91.
Disadvantages of silver as a standard of value, 12,176–7.
The rupee should be fixed at 1*s.* 4*d.*; criticism of objections to that rate, 12,192–8, 12,289–91, 12,309–27.
Effect of the closing of the mints on the gold value of the rupee, 12,199.
Objection to the proposal of the Government of India for melting rupees, 12,200.
The only sound ultimate foundation for a gold standard in India is convertibility of the rupee, at any rate for the purpose of foreign exchange, 12,201–2, 12,288.
Objections which have been urged against the policy of convertibility, 12,203–8, 12,260–74.
Importance of cautious financial administration to enable India to retain gold, 12,209–14.
Exchange cannot be improved by manipulating currency for the purpose of increasing exports, 12,215.
Effect on the money market of depreciating the currency, 12,216–7.
Monetary stringency in India in 1897–8, 12,218.
Importance of inspiring confidence in the future gold value of the rupee, 12,219–21.
Question of a gold currency for India, 12,223–5, 12,279–82, 12,302–3.
Mr. Lindsay's scheme, 12,223–37.
Management of gold reserve should be entrusted to a bank, 12,237–43.
Time at which convertibility of the rupee should be undertaken, 12,221, 12,244–9, 12,257–9, 12,275–8, 12,295–301.
Desirability of obtaining the support of the Imperial Government for the establishment of a gold standard in India, 12,237–9, 12,250–6.
It may be necessary to borrow in order to maintain the gold standard, 12,254–6, 12,304–8.

MR. JOHN MATHESON MACDONALD.

Has many years' experience of trade with China, 12,328–32.
Competition in cotton between India and China:
Apart from currency causes, China would be able to compete successfully with India; the Indian currency system increases China's power of competing with India, 12,334–5, 12,502–3.
China's advantages are cheap and efficient labour, 12,337, 12,341–2, 12,353–4, 12,488–9; cheap coal, 12,338; command of raw material, 12,339, 12,349–52, 12,465–73, 12,498–500; vicinity of market, 12,340.
Cotton mills erected by foreigners in China since 1895; devoted chiefly to the production of yarn, 12,336, 12,343–8, 12,485–7, 12,493–7.
Likin duties, 12,355–6, 12,370, 12,505–14.

MR. JOHN MATHESON MACDONALD—*cont.*

Competition in tea between India and China, 12,361-2, 12,369-75, 12,474-84.
Opium trade between India and China, 12,361, 12,363-6, 12,515-7.
Prices and cost of production in China, 12,393-402, 12,504.
Chinese standard and currency: standard of value is silver by weight, 12,381-8; use of silver coins, 12,382, 12,386-8; use of copper cash as subsidiary currency, 12,385: native banking system and use of paper money, 12,389-91; disadvantage to China of the absence of a well regulated currency, 12,392, 12,490.
Competition in cotton between India and Japan, 12,357-60.
Indian currency system: desirability of re-opening the mints and returning to a silver standard; international agreement almost impossible; necessity for a large reserve of gold, if a gold standard is to be established, 12,376-80, 12,403-64, 12,492, 12,518-26.

MAJOR LEONARD DARWIN.

Has written on bimetallism and on the Indian Currency question; is of opinion that under certain conditions bimetallism is the best currency system, but is in favour of a gold standard for India; is strongly opposed to the re-opening of the Indian mints to silver, 12,527-36.
Is in favour of the rate of 1*s.* 4*d.* for the rupee, as being that which would cause least disturbance and is expected by the public; a higher or lower rate would not affect the community as a whole, but would, by its action on prices, affect various classes, 12,537-46.
If existing arrangements are maintained, a gold standard will in time be automatically established; but the existing arrangements should in any case be modified so far as to allow the public to buy gold from the Government's gold reserve; gold should be kept out of the currency, 12,547-66, 12,615-6, 11,625-31, 12,664-70, 12,693.
Scheme for establishing a gold standard in India, if more vigorous measures are considered desirable:—
Notes to be issued in London in exchange for sterling, and in India in exchange for gold or rupees; the rate for the issue of notes against sterling in London, and against gold in India, to be 1*s.* 4*d.* the rupee, and the Government to reserve the right to charge ½ per cent. premium on the issue of notes against rupees; all notes to be convertible into gold in London, and, for the present, into rupees in India; the Government to have the power of cancelling, after due warning, their liability to convert notes into rupees; notes and rupees alone to be legal tender, and all laws and regulations recognising gold as currency in India, and authorising its receipt by Government in payment of dues, to be repealed; the liability to convert notes into gold to be, if necessary, limited to a definite amount, 12,567, 12,579-97, 12,617-24, 12,632-53, 12,656-63, 12,679-83, 12,690-2, 12,700-19.
Effect of limiting the liability to convert notes into gold, 12,592-6, 12,599-601, 12,653-5, 12,686-9.
Elasticity of the currency increased by making notes convertible into gold in London, and by allowing the issue of notes against a given quantity of gold to be increased, 12,567, 12,602-14, 12,671-8.
A gold standard with a large gold currency, as in England, would, if practicable, be better than the scheme given above, 12,720-1.
Criticism of the charge of artificiality brought against Mr. Lindsay's scheme and similar schemes, 12,568.
Convertibility of the rupee, 12,569-87, 12,590-2.

RIGHT HON. THE LORD ALDENHAM.

Has been Governor of the Bank of England; was a representative of the British Government at the International Monetary Conference of 1878; is President of the Bimetallic League, but does not give evidence as representing that body, 12,722-8.
Disapproved of the closing of the mints; reasons for disapproving; effects of the measure, 12,729-38, 12,809-10, 12,829-31, 12,849-52, 12,905-6, 12,924.
Objections to a "managed" currency, 12,732, 12,798, 12,822-8, 12,924.
Disapproves of the proposal to establish a gold standard in India, 12,739-40.

THE RIGHT HON. THE LORD ALDENHAM—*cont.*

Reasons for disapproving of the proposal:—
India requires silver as a circulating medium; a gold standard should be accompanied by a currency that consists of gold or is convertible into gold; objections to the establishment of such a currency in India, 12,741-3, 12,777-808, 12,907-10, 12,914-8.
Desirability of avoiding a further drain on the world's supply of gold, 12,745-52, 12,838, 12,921-3.
The establishment of a gold standard would cause a further fall in the rupee price of silver, 12,829-31.
Criticism of the proposals of the Government of India to melt rupees and to borrow gold for transmission to India, 12,813, 12,865-9.
Criticism of Mr. A. M. Lindsay's scheme, 12,815.
Great Britain and Canada are the only countries with a pure gold standard, 12,757-9, 12,773-6; standard of value in France and America, 12,753-5, 12,821.
International agreement for the coinage of silver:—
The negotiations which were entered upon in 1897 should have been continued, though the rejection of the proposals made by the American envoys was inevitable, 12,839-40, 12,855-64, 12,913.
Views of witness as to willingness of the United States to enter into an agreement on the basis of a ratio of gold to silver of 22 to 1; correspondence with Colonel John Hay, formerly American Ambassador in London, 12,841, 12,844-6.
Attitude of France towards international agreement, 12,844, 12,873-4.
Consequences that would result from the opening of the American mint to the unlimited coinage of gold and silver at a ratio of 22 to 1, 12,841, 12,876-904, 12,924.
Opinions of authorities in England and India as to the advantages of an international arrangement, 12,846, 12,924.
Importance of stable exchange between gold-using and silver-using countries, 12,847-8.
A depreciating currency is not a source of advantage to a country, 12,919-20.
Witness is in favour of leaving the currency system of India unchanged for the present, 12,842, 12,853-4, 12,870-2, 12,906.

MR. HENRY DUNNING MACLEOD.

Has studied economics and written on the subject for more than forty years, 12,925-7.
The closing of the Indian Mints to the free coinage of silver in 1893 was absolutely necessary in the interests of the Government of India; the re-opening of the mints would be disastrous, 12,928-32.
In order that the rate of exchange between England and India may be rendered stable, an effective gold standard with a gold currency should be introduced into India, 12,933-5, 12,945, 12,958-9, 12,970-3.
Steps by which gold currency should be introduced into India; sovereigns to be declared legal tender; the Indian Mints to be authorised to coin sovereigns and half-sovereigns; customs duties to be payable in gold; measures for restoring to circulation the ancient gold currency of India, 12,944-57, 12,968-9, 12,974-85.
Suitability of a gold currency for India, 12,936, 12,939.
Criticism of the historical arguments used by Mr. Lindsay in support of his scheme, 12,937.
The Government of India should not undertake to give gold in exchange for rupees, 12,938, 12,960-7.
The rupee should be fixed at 1*s.* 4*d.*; there is no natural ratio between the rupee and gold, 12,941-3.
In course of time the rupee should be declared to be legal tender for a limited amount only, 12,940.

RIGHT HON. LEONARD H. COURTNEY, M.P.

Proceedings of the Herschell Committee; reasons for recommending that the proposal of the Government of India for the closing of the Indian mints, with a view to the adoption of a gold standard, should be sanctioned, 12,986-93; reasons for recommending that the rate of 1*s.* 4*d.* should be chosen as the upper limit of the value of the rupee, 13,028-9, 13,078-80, 13,106-16, 13,119-21.

Analysis.

RIGHT HON. LEONARD H. COURTNEY, M.P.—*cont.*

Results of the closing of the mints; the gold value of the rupee has been fixed at 1*s.* 4*d.* through relative contraction of the currency, 12,994–7, 13,003, 13,012, 13,025, 13,030–1, 13,054–7, 13,083.

Effect of relative contraction on the value of paper currency in the United States and in Austria, 12,996, 13,003, 13,009, 13,058–62.

The existing currency arrangements in India will probably lead to the automatic introduction of a supplementary gold currency, 12,998–13,001, 13,088–94.

The Government of India should at present take no further steps with reference to the currency, except to open the mints to the coinage of gold, 13,021–2, 13,032, 13,063–71.

The Government of India should not undertake to give gold for rupees; the silver token currency of England is maintained at its nominal value without convertibility, 13,003–9, 13,033–8, 13,081–2, 13,099–100.

Gold should be allowed to accumulate for the present in the Government treasuries in India; method of dealing with accumulations of gold, 13,072–4, 13,101–5, 13,122.

Advantages that would accrue to India if the gold value of the rupee rose in consequence of action on the part of the United States, 13,046–53, 13,096–8.

Any advantage that silver-using countries may have over India, owing to the appreciation of the rupee beyond its bullion value, is transitory, 13,095.

Effect of appreciation of rupee on burden of taxation, 13,117–8.

Currency of France, 13,013–4, 13,017–9, 13,084–6.

Currency of Java, 13,074–7.

INDIAN CURRENCY COMMITTEE, 1898.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

COMMITTEE

ON

INDIAN CURRENCY.

LIBRARY OF THE BOMBAY BRANCH OF THE ROYAL ASIATIC S.

At the India Office, S.W.

NINETEENTH DAY.

Friday, 4th November 1898.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P. (in the Chair).

THE LORD BALFOUR OF BURLEIGH.
SIR JOHN MUIR, Bart.
SIR FRANCIS MOWATT, K.C.B.
SIR DAVID BARBOUR, K.C.S.I.
SIR CHARLES CROSTHWAITE, K.C.S.I.
SIR ALFRED DENT, K.C.M.G.
MR. ROBERT CAMPBELL.
MR. EVERARD HAMBRO.
MR. W. H. HOLLAND.
MR. F. C. LE MARCHANT.

MR. ROBERT CHALMERS, *Secretary.*

The Right Hon. the Earl of NORTHBROOK, G.C.S.I., called and examined.

Rt. Hon. Ear of Northbrook G.C.S.I.

4 Nov. 1898.

8394. (*Chairman.*) Will you state how long your connection with India has been?—I began as private Secretary to Lord Halifax, when he was Sir Charles Wood and President of the Board of Control, before the Government of India was transferred from the East India Company to the Crown; that was from 1853 to 1855. Then, afterwards, when I came into Parliament, I was Under Secretary for India from 1859 to 1860; Sir Charles Wood was then Secretary of State for India. I then went to the War Office for a short time, and subsequently went back to the India Office and remained there till 1864. I was Governor-General of India from 1872 to 1876.

8395. Have you read the volume recently published, containing the report of the evidence taken before this Committee?—Yes.

8396. The first question upon which I ask your opinion is as to the closing of the mints in 1893?—I think I had better explain to the Committee my own individual view upon that question. I had very great doubts at the time whether it was right to close the mints in 1893. After further consideration of the question, and reading the evidence taken before this Committee, I was satisfied that, as no international arrangement appeared to be practicable for opening other mints to silver at a reasonable ratio to gold, (I held that the 15½ to 1 ratio was quite unreasonable and impracticable), the Indian Government were right in closing the mints to silver with a view to changing the standard of value in India from silver to gold. I put that clearly, because to close the mints in India without establishing a gold standard would, I think, have been wrong. I should like to add that I think the closing of the mints was quite justifiable. It cannot be denied that a government has a right in certain circumstances to change the standard of value. It is, of course, a serious matter, but there are many countries that have done it quite recently; Germany and France and other countries have changed their standard of value. Therefore, the idea that the Government of India had no right to change the standard of value in India appears to me quite untenable. I myself do not believe that the measure has seriously interfered with public or private interests in India. The individuals who were immediately affected by the closing of the mints were the holders of silver bullion, because the closing of the mints lowered the value of their silver, for it was immediately followed by a fall in the price of silver; but it must be remembered that the price of silver must have fallen considerably, even if the mints

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

had remained open. The extent to which it would have fallen I cannot say, but there must have been a fall. On the other hand, the holders of rupees may have had some advantage through the closing of the mints. I use the word "may" deliberately, because I do not myself believe that Indian prices—I mean prices in the internal trade of India—have been affected to any extent by the closing of the mints. At any rate, whatever result has followed to the holders of rupees, it must have been in their favour rather than against them. And it must also be remembered that all the holders, in India and elsewhere, of Government rupee paper obtained a distinct advantage by the closure of the mints. If the mints had remained open, of course the rupee loans would have gone on depreciating to the full extent of the fall in the gold price of silver. That affects very much the interests of the moneyed classes in India, who hold a good many of these Promissory Notes. There are 25½ crores of rupees of this stock held by natives of India, besides certain loans which are held by the native princes. I have seen it stated that the native princes of India have been injuriously affected by the closing of the mints. I believe this to be an entire mistake. They are large holders of rupee paper, and, therefore, to that extent at any rate, they have been much benefited by the measure. Take Sindia—the Maharajah of Gwalior—he holds 5½ crores. Then take Holkar—the Maharajah of Indore—he holds one crore of rupee paper, and other native princes have a large quantity of rupee paper. I was apprehensive, when the mints were closed, that considerable hardship would be inflicted upon the people who had silver ornaments in India, because they would not any longer be able to exchange their silver ornaments of a certain weight of silver for rupees of the same weight. That apprehension of mine has been very greatly, if not entirely, removed by the evidence given before this Committee by Sir Antony MacDonnell. I consider that Sir Antony MacDonnell is the highest authority that could be examined by the Commttee upon the condition of the North-Western Provinces. He is one of our very best administrators in India at the present time. He has had a most intimate knowledge of the people, from having managed with great ability and conspicuous success the recent very serious famine in the North-Western Provinces. The other day he did a still more important piece of service to the Government of India. During the outbreak of plague in Hardwar, which, as some members of the Committee well know, is one of the worst possible places in the North-Western Provinces in which such an outbreak could occur, because there is a great fair held there, Sir Antony MacDonnell managed with great ability to check that outbreak of the plague without exiting any bad feeling on the part of the native population. I mention that to show the Committee what kind of man Sir Antony MacDonnell is, and I thoroughly trust all he says about the condition of the people in the North-Western Provinces. I was very glad to see what he said about it, because I consider that the mass of the people in the North-Western Provinces, which is almost the mainstay of the British Empire in India—perhaps that is too strong a word to say, but, at any rate, it is one of the most important parts of India—those people have certainly benefited by the increase of trade, and the rise in prices in India. Sir Antony showed, in a most interesting way, that although they had had to meet this great famine, yet, very shortly after the famine, they were able to pay their land revenue, and did pay it, and declared that they did not want any further remissions. That shows how well off the people of those Provinces are, comparatively—I use the word "comparatively," because everybody knows how poor the people of India are, on the whole, as compared with the people of this country. However, on the particular point on which the Committee examined Sir Antony MacDonnell, namely, whether this possible hardship from the natives holding silver ornaments had any serious effect, he satisfied me. I do not know what impression he made upon members of the Committee; but his evidence, as I have read it, satisfies me, at any rate, that no very serious hardship has actually occurred. He said, and I have no doubt he said truly, that, possibly on account of the increased wealth of the people, the greater part of their hoards are now kept in rupees, and, of course, so far they were not touched. They must have suffered to a certain extent, but I am satisfied that there was no serious hardship arising to the people through the closing of the mints. I believe I may state, without hesitation, that the Committee will have the same evidence from the highest authorities as regards the people of Behar—that is in northern Bengal—where the people are very poor, and where the difficulty in respect to the sale of silver ornaments might have been expected to touch them severely. I would add this, that, of course, if the closing of the mints had produced the effect of lowering prices all over India, that would have injured the agricultural class—the class who pay the land revenue; but, according to the experience of everyone who has a knowledge of India, and according to the statistics which the Committee have had before them, the effect of the circulation upon prices operates very partially and very slowly in India, and there is not an atom of evidence that I have seen to show that the closing of the mints has affected prices in the internal trade. I will not say that it has not touched the price of opium; but as regards the internal trade, the statistics prove, I think, as conclusively as any statistics can, that Sir Antony MacDonnell's opinion is right, and that it has not in any way affected the interests of the people with whom the Government has land settlements in the North-Western provinces. Perhaps the Committee will look at these statistics (they are in the Statistical Abstract annually presented to Parliament). Take the prices in the country—not Calcutta prices, but the prices up country—of the principal articles produced in the North-Western Provinces. I will not go into the figures, because they can be worked out by the members of the Committee for themselves; but, putting aside famine years, and taking ordinary years, the prices of almost every article which the cultivator produces in India have risen, and to that extent, of course, the land revenue has been eased. I have heard people say that, because this has happened, the Government of India would have a right to raise taxation on the people. I entertain the strongest opinion that the real safety of India depends on the land revenue being easy. It is the opinion of almost every administrator of any weight who has been responsible for the government of India, or the government of provinces of India, that the contentedness of the mass of the people depends upon the land revenue not being pushed up too high, and that, if possible, it should be so fixed that the people do not feel it. The Committee must recollect—I think Sir Antony MacDonnell explained it, but I repeat it because it is a thing to recollect—that the Government stand, more or less, in the position of landlord over the whole of India, and the position of the Government of India, if the land revenue was too high, would be just like that of a landlord whose rents are too high, and the whole of whose tenants are living in misery, and living from hand to mouth. One other remark as to the effect of the closure of the mints. I cannot say that I see that it has had any sensible effect upon the export trade. During the famine and plague years, you could not expect the full trade to go on, and the export trade has suffered. But I see that this season there is a great recovery, and this year is very likely to be as big an export year as any that we have had in India. I do not think I have anything more to say as to the effect of the closing of the mints.

8397. Do you think that the mints should be re-opened for the purpose of the coinage of silver?—My opinion is distinctly adverse to the re-opening

of the mints. I have no hesitation in giving that opinion.

8398. You consider it would be injurious to India and to its trade and commerce to re-open the mints?—Yes, and I would add not only to the trade and commerce of India, but to the interests of the people of India, to which I myself attach the greatest importance. I come here, perhaps, more to represent the interests of the people of India than anything else, because anyone who has been in the position that I have had the honour to hold must feel that the duty of those who have to administer India is to look after the general interests of the people.

8399. Then, one of the reasons that would influence you in being adverse to the re-opening of the mints would be that the financial position of India would, if they were re-opened, require an increase of taxation?—Yes. I may say that, so far as I have understood the arguments put before the Committee, the arguments of those who wish to open the mints are that it would encourage trade, stimulate exports, and concurrently, people getting more money for their exports, stimulate imports. It would encourage the tea planters and those concerned in other enterprises of that kind, because they would get the advantage for a time of the fall in exchange, until the wages paid to labour, and so on, rose in India; it would relieve them from the apprehension that they have, that their competition with China will be seriously interfered with by the closing of the mints while the price of silver in China remains at its natural level. I should have something to say upon this point, if any member of the Committee desires to ask me a question about it. But, on the other hand, you may put, as the advantages of keeping the mints closed, and establishing the gold standard, that you would arrive at stability of exchange; that English capital would be invested in India without risk, because with a falling exchange it is not reasonable to suppose that capitalists will send gold capital to a silver standard country. It is also, to my mind, a considerable advantage that the standard would be the same as that of the countries with which India does 80 per cent. of her trade. I think that the increase of prices which might follow—I use that word "might" deliberately—from the re-opening of the mints might benefit producers; but I do not believe that any stimulus is necessary for that, and certainly when the increase of the rupee circulation which would follow from the re-opening of the mints came to be felt in its full force, it would have the effect of raising prices. It would be very, very slow, but still it would have that effect. Then, consider who are the people who would suffer by that. It would be the consumers who are not also producers. The very poorest of the great masses of India, being consumers, would be injured—all those whose wages are very small—they would have to pay more for the articles of their daily consumption in consequence of the increase of prices. But whatever view may be taken of the balance of the arguments that I have just put before the Committee, it seems to me that the conclusive objection to re-opening the mints is in the fact that India would have to meet the heavy charge which it would involve.

8400. Do you mean the home charges?—The heavy charge which would be brought on India in consequence of re-opening the mints.

8401. Have you formed any opinion as to what the amount would be?—The best calculation I have been able to make of the sum to be made up if the gold price of the rupee fell from 16*d.* to 1*s.*, which is a reasonable calculation, is that from eight to ten crores of rupees would have to be found. Against this should be set some increase in the receipts from the Customs *ad valorem* duties; there, there would be some increase—not very large. There would be a considerable increase in the receipts from the opium sales, say, a crore of rupees. Many items of Indian revenue may be expected gradually to increase, but you cannot calculate on any considerable immediate increase. You see, from the returns year by year, that, although there is an increase, it is gradual, and it is not likely to be at all sudden.

8402. But you are rather assuming a 1*s.* rate, are you not?—Yes.

8403. The intrinsic value of the rupee now is 10*d.*?—Yes, but I add 2*d.*, because I think it is possible that the opening of the mints might have an effect on the price of silver. When I say that 8 to 10 crores will be necessary, there are people who estimate it at very much more than that. I have taken what I consider to be a reasonable estimate. The receipts from Customs and from opium would go a very little way to meet the additional charge, and it would have to be met in one of two ways, either by borrowing—which no one would suggest, because it is felt, I think, by every responsible person that any large increase of borrowing would probably land India in bankruptcy in no very long time—or the taxation must be increased.

8404. (*Sir F. Mowatt.*) Have you estimated at all the amount to set against the 10 crores increase of taxation?—If you put it at about 1½ crores, that is about as much as would be safe to calculate.

8405. At all events, you would put the *total* additional taxation at not less than 8 crores?—I would put it at 7 crores, if you like. I should be sorry to make an absolute estimate.

8406. (*Chairman.*) What Sir Antony MacDonnell says is this, at Question 5780: (*Q.*) "Will you give us "your opinion as to the economic effect of attempting "to increase the taxation of India? (*A.*) I suppose, "if the rupee fell to 1*s.* you would have, in order to "make both ends meet, to raise 10 or 12 crores "of rupees additional taxation, and, I suppose, from "my province I should be asked to raise 2 crores, "or thereabouts. I say that it would be impossible to "do that without producing such political discontent "as would be an extreme cause of danger"?—Whatever the amount may be, I have put it reasonably, as I think anyone will admit who has gone into the matter. It is better to put it a little under than to put it a little over.

8407. As there has been a good deal of suggestion made to the Committee as to the possibility or justifiability of increasing the taxation of India, we shall be glad to have your opinion upon the matter?—In the first place, I am not here to say that it would be an impossibility to increase taxation in India. I think it would be possible, but I think it would be in the highest degree unwise, both in respect of the trade of India, the welfare of the people of India, and I will go so far as to say the security of the Indian Empire. The Committee must recollect that, according to a statement before them, taxation has been imposed in India since 1884 to the extent of 6½ crores of rupees, so that we come, not with a clear sheet, but at a time when already the Government of India have had to put on that additional amount of taxation.

8408. During what period is that?—Since 1886. If the Committee will refer to the Appendix they will see that the income tax has been imposed, amounting to Rx. 1,800,000. Then there is the duty on petroleum, which is a small thing, Rx.155,000; the salt duty, which is paid by the very humblest classes in India, and is considered to be a great hardship upon them, has been raised by Rx. 1,600,000. Then the increase of duty on imported spirits comes to Rx. 100,000, the general import duties to Rx. 1,600,000, the import duties on cotton to Rx. 900,000, the increase of Kohat salt duty Rx. 50,000, re-imposition of the Patwari cess in the N.W. Provinces, which is a tax on the cultivating classes, Rx. 200,000, making a total of Rx. 6,405,000.*

* Note.—On looking again at Mr. O'Conor's figures I think the provincial licence tax which was absorbed in the Income tax should be deducted from this total. In the last year of its existence, that licence tax yielded Rx. 472,800, so that the net amount of fresh taxation would be Rx. 5,932,200.

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

8409. Since the fall of silver?—Long since the beginning of the fall of silver. And, moreover, Mr. O'Conor, who prepared that Appendix, says "No "remissions or reductions of taxation can be noted "as a set-off against the taxation which has been "imposed since 1886." Those are the figures which justify my statement that there has been a large increase of taxation already in India.

8410. Now with respect to the suggestions that have been made as to the sources from which increased taxation could be had; first of all, will you deal with the land revenue?—I do not think anyone has advanced the proposal that we should interfere with the land settlements in India. Such a proposal would never be entertained for a moment by anyone who has had anything to do with Indian administration. It would create a reasonable ground for an accusation of want of faith against the Government of India, and would certainly be dangerous to the stability of our rule. At Question 7069, Mr. Steel suggests that the settlements might be shortened from 30 years to 10 years. I think there is the gravest objection to that. No one who knows anything about the process of altering the assessments in India, can fail to be aware that it disturbs very greatly the district that is being dealt with. The land revenue settlements in the North-Western Provinces are for 30 years. We know that for the year before, and for some little time after, the re-settlements, everybody concerned is disturbed; and to make re-settlements every 10 years would aggravate that evil very greatly. It has been the desire of the Government, as much as possible, by certain processes, such as taking averages, and so on, to reduce as far as can be done the evil necessarily arising from the making of fresh settlements. There must be some evil; but to alter the term from 30 years to 10 years would be, I think, a proposal which no Indian administrator of experience would support.

8411. The next point is the duty on imports?—I see Mr. Ralli proposes that the import duties should be trebled, and, I suppose, that an equivalent excise should be imposed upon Indian cotton manufacturers, so as to prevent any protective incidence of the duties. I, myself, looking at it as a man practically concerned in politics, think that it is a proposition which no Government here would entertain. We all know how difficult it was to persuade the cotton interests in England to accept the present low duties; and for the Government of India to propose to treble the duties would be to make it certain, in my opinion, that Parliament would not support them, and that it could not be carried out. Besides that, on the merits of the case, I am rather against the increase of the duties. Customs duties are not a good thing in themselves, and I should very much have preferred that the duties had not needed to have been put on at all. I approve of the policy for India of having as much free trade as you possibly can. It increases your imports and it increases your exports; and, as the solvency of India depends mainly on her trade, that is to say, that the exports of India should be larger than the imports, the more you have free trade the more you are likely to benefit the country. I should object in principle to increase the import duties, but I am bound to say that it is rather the middle and upper classes who consume Manchester goods, and, therefore, the poorer classes would not be much affected.

8412. But there is an excise duty on some Indian goods?—I was referring to the products of native hand looms, which I believe to be mainly used by the poorer classes.

8413. Then have you anything to say about exports?—I really think it is hardly necessary to argue about exports. Mr. Ralli proposed a 10 per cent. duty on shellac and jute. It has even been proposed to put a 10 per cent. duty on tea. I consider that, the financial condition of India depending so much on the exports being greater than the imports, it would be a suicidal thing to put a tax on her exports. I always thought that one of the first duties that ought to be taken off in India is the export duty on rice. I should very much like to see it taken off, and that has been the opinion of most men who have had to do with Indian finance, but they have not been able to carry it out. To tax your exports is simply to diminish the balance in your favour between exports and imports, and I do not consider that it is a reasonable proposal.

8414. Then the next would be the salt tax?—I believe you would get a crore, or something like that, by raising the salt duty from 2 rupees 8 annas to 3 rupees per maund. That would be entirely borne by the very poorest people in India, and also by the agricultural interest, because salt is very necessary for cattle, and it is supposed, even now, that the salt tax interferes with the agricultural industry. My feeling about the salt tax is that it is too high, both because it presses upon the poorest of the people, and because it is the only tax which, if it was put at a low figure, such as 1 rupee per maund, the Government of India could use in times of emergency to raise at once some increase of revenue without difficulty. We have already put upon the poorest of the people a taxation on salt to the extent of Rx. 1,600,000 in 1888, and I am opposed to any increase of that tax.

8415. Now, the other taxes are the excise and the assessed taxes. Have you anything to say about those?—I do not think you could rely upon any increase of those taxes. I believe the excise is now being worked so that the greatest possible amount is raised consistently with not encouraging the consumption of spirits. That is the principle upon which we have always worked the excise duties in India. There was another suggestion made, which is subject to the same objection as the tax upon exports, viz.:—that you should raise the railway freights. The Government of India have always looked upon railroads, not so much with a view to making profit or even paying interest on capital, but with a view to developing the trade of the country. Speaking generally on the question of raising taxation in India, I think it has been suggested by some of the witnesses that a committee should be appointed to ascertain whether taxes could be raised which nobody has ever thought of up to the present time. I believe I can say without hestitation that many Indian financiers and statesmen have considered with the greatest care what taxation can be raised in India. I have at home a mass of matter dealing with this topic. I have a whole volume about the suggestion of putting on a tobacco tax. The objections to raising a tobacco tax in India are not only that you would be taxing one of the little luxuries that the mass of the people enjoy, but you would have to create a gigantic system of excise. Every man who grew an acre, or a quarter of an acre, of tobacco would have to be watched by subordinate native officials. It would create the greatest discontent, and would be open to the gravest objection to any tax, namely, that the receipts which would come into the hands of the Government would be much less than the money paid by the people in order to conciliate the officials who had to collect it. I do not think that there are any new taxes that have not been fully considered and set aside by those who have been responsible for the Indian finances. I may mention to the Committee that, when I went to India in 1872, there was considerable discontent about taxation. I will not go much into the reasons, but the result was that, after giving the best consideration I could to the matter, I resolved to follow the course which my predecessor, Lord Mayo, had intended to take. When the income tax expired in 1873, I did not renew it, and I believe that that policy had a very good effect. I also endeavoured, as far as I could, to prevent any increase of taxation, even locally, excepting very gradually. The condition of India now—at least I hope so—is better than it was in 1872; th

people may be better off; but if I had to consider this question I should be guided very much by those who have been responsible for the finances of India and the administration of India since I was there. I should be glad if the Committee could refer to Lord Cromer's evidence which he gave in 1887 before the Gold and Silver Commission, because he went into all this very fully, and what I have stated now as my own conclusions is almost entirely the same as the evidence given by Lord Cromer. If I were responsible for the finances of India, I should consider that the evidence given before this Committee by Sir Antony MacDonnell (whose authority I have already alluded to), at Question 5795, would be conclusive, because it is the opinion of a practical administrator in the country. He says, "If taxation to the extent of eight crores of rupees, "not to say 10 or 12, were imposed, we should not "be able to hold India to-morrow without danger of "tumults and insurrections." That opinion is in itself very strong, but he adds words which make it to my mind still stronger, knowing, as I do, what a careful man he is. He says, "I think I am bound "to say that I have had exceptional opportunities of "knowing what native feeling is as regards the "imposition of further taxation on the country."

8416. In that opinion you fully concur?—I do. Then, I may remark also upon this subject that the taxes proposed to be put on would either fall on the mass of the people, and the larger portion on the very poorest of the people, or upon trade. This shows, I think, that the policy of the Government of India in preventing the further fall of silver, rather than imposing new taxation, is in the interests of the people and in the interests of Indian trade.

8417. Now, I will ask if you think that the present monetary situation should be allowed to continue—the mints closed, with no gold standard, and the whole control, so to speak, of exchange left in the hands of the Government by their being able either to restrict or enlarge the circulation?—Well, I am not quite certain whether the Government of India might not have delayed their proposals for some little time; I will not say that they could not have done that; but as they have been made, and as the question has been referred to this Committee, I am strongly of opinion that it ought to be decided. I fully see the objection to the present condition of the currency which the Chairman has suggested, viz.:—that there is now no real standard of value and no automatic process, certainly no effective automatic process, of regulating the currency. I think that this may be exceedingly dangerous to the interests of any country, and I do not believe that any Government in so large a country as India is wise enough or has information enough to enable it to regulate the currency. There ought to be some automatic process whereby, if a demand comes for currency, it can be supplied independently of the will of the Government. Therefore, I think that the question should be decided, and that the period of uncertainty which has existed since the closing of the mints should no longer be prolonged. Apparently it has had a bad effect upon the transmission of English capital to India; at any rate, it has prevented the flow of English capital to a certain extent, and it appears to have had something to do with creating stringency in the money market. But, at any rate, the sooner we get to a sound system of currency in India, the better.

8418. Have you considered the proposals of the Government of India to introduce an effective gold standard into India?—I have rather devoted myself to the question of principle and to certain other proposals that are before the Committee. If I am asked the question,—I do not agree with the proposals made by the Government of India.

8419. You are aware that, when the Government of India closed the mints in 1893, it was as a first step towards the establishment of a gold standard?—I think they would not have been justified in doing it unless it was intended as a first step towards a gold standard.

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

8420. Then, what do you think of a gold standard for India?—I think I may say that I cordially support the view of the Government of India as expressed in the Despatch of the 16th September 1897. It explains so clearly what their views were, that, perhaps, the Committee will allow me to read it:—"The currency system of India is in a transition "state; the Government of India in 1893 decided to "establish a gold standard, and the first step towards "that object was the closing of the mints to silver "by Act VIII. of 1893. The silver rupee is still the "sole legal tender coin, though the Government has "by executive orders undertaken to receive gold "and sovereigns under certain restrictions set forth "in Notifications Nos. 2662 and 2663 of the 26th "June 1893, the rate of exchange adopted being 16*d.* "the rupee, or 15 rupees = 1*l.* The measures to be "taken when the transition period has passed have "not been laid down, but it is probable that the "Indian mints will be opened to gold, and gold coins "will be made legal tender to an unlimited amount; "silver rupees would also continue to be legal tender "to an unlimited amount; and the ratio between the "rupee and the gold coins as legal tender would "at the same time be finally settled. The system "towards which India is moving is thus a gold "standard of the same kind as that which now exists "in France and the United States, but with a "different ratio for legal tender; but for the present "the mints are closed both to gold and silver. The "transition period has lasted for more than four "years, but there is ground for hope that it is now "drawing to a close." I endorse the way in which that is put by the Government of India.

8421. You concur in that, totally irrespective of the mode in which they propose to carry it out?—Certainly. I do not agree with the particular method proposed by the Government of India in their letter of March 1898, which has been referred to this Committee.

8422. Now, have you given any consideration to the question as to how a gold standard should be established? In the first place, would you open the mints in India to gold?—Yes. I think that, in order to establish a practical gold standard, it must be accompanied by a gold currency. I do not understand a gold standard separated from a gold currency—I mean, separated from giving anybody who has gold the power of taking it to some place, and having it cut into pieces of the weight and fineness of the standard of value to be established. A gold standard means that by law a certain quantity of gold of a certain fineness, marked in a certain manner, shall be the measure of value for commodities, and I do not understand how such a standard can be introduced for any practical purpose unless the Indian mints are opened for the coinage of gold, and this is the same thing as to introduce a gold currency.

8423. The principle would be that the holder of gold must have the right to go to the Indian mint and have that gold converted into what would be a current coin, which would be legal tender?—Certainly. Without that, I do not see that you can have a really sound gold standard.

8424. Then what do you think about the converse proposition—taking silver, and having that converted into gold?—That is a very important question—one of the most important questions which the Government will have to consider from time to time. In my opinion, it is not necessary to the establishment of a gold standard that the token silver currency should be convertible into gold. It is not done in France at this day, and it does not seem to me that there is any necessity, as a matter of principle, for the token rupee coinage to be convertible into gold. At the same time, I think it is extremely desirable that rupees should be convertible to some extent, immediately if possible, but certainly in the process of time. Of course, it might be done in different ways. It is a

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

matter rather of detail—a subsidiary matter to establishing the principle upon which the standard of value and the currency should be founded.

8425. We have had several schemes put before us for carrying out that gradual convertibility. Mr. Lindsay's appears to be confined to exchange purposes only?—I have very carefully considered, so far as I have been able, Mr. Lindsay's and Mr. Raphael's schemes, and I think they are very ingenious; but they appear to me, as the Chairman has said, to be for the purpose of establishing what Sir John Lubbock calls an "exchange standard"—a standard only for the sake of international exchange, and it is an essential point of Mr. Lindsay's scheme that there shall not be a gold currency in India. That is, to my mind, almost a fatal objection; and there is another very grave objection, namely, that his scheme imposes a liability on the Indian Government to change rupees for gold wthout any limit. I am not prepared to say that, if I were responsible for the finances of India, I would undertake that liability. It is one of those liabilities which it is impossible to estimate. We do not know how many rupees there may be in India, and we do not know how many rupees may be sent in to be exchanged for gold. There are some calculations before the Committee about the rupee currency, but they are not altogether to be relied upon, however carefully Mr. Harrison has made them, and he has certainly exercised very great care; but the liability is one, I think, that the Government would not dare to undertake. I may say that, as regards these schemes, I agree with the criticisms made upon them by Lord Rothschild and Sir Samuel Montagu. I do not believe that any scheme for bringing capital for temporary purposes to India by the action of the Government would be advisable. The Government would probably come out losers by any such transaction. I think the schemes are too artificial. In my opinion, the principles upon which the standard of value and the currency of a great country like India are to be regulated, cannot be too simple.

8426. Would you continue the rupee as a legal tender to any amount?—Unlimited at first.

8427. But with any idea of restricting it?—That is a matter which must be very carefully considered by the Government of India. I have been unable to find any materials to enable me to give an opinion as to what amount of transactions in India are small and what amount of transactions are large. My impression is that the great mass of the transactions, both of the Government and of the people, are small, and that it might, in the end, be feasible to limit the legal tender of the rupee, after a considerable time, to transactions below a certain amount. I will not state what amount, because I have no materials to justify me in making any suggestion of amount. At the same time it must be done with the greatest caution. Great care must be taken not to interfere with existing contracts, and also great care must be taken not to interfere with the feelings and prejudices of the people.

8428. Would you have the Indian mints coin sovereigns?—Certainly. I think the first step to be taken should be to make the sovereign legal tender in India—as you know, it is not so now—and to open the Indian mints for the coinage of sovereigns of the standard weight and fineness, the same as our sovereigns. The Imperial Government, of course, would allow those sovereigns to be legal tender all through the Empire, in the same way as Australian sovereigns.

8429. You think that would create an automatic flow and reflow of gold?—I think it would have that effect in a certain time. It would require a little time to produce that effect, but it would in the end have that effect.

8430. In the first instance, would gold have to be provided for that purpose by the Government of India?—I do not think that it would be necessary. I have seen it stated that to establish a gold standard and a gold currency in India would require an enormous accumulation of gold by the Government of India. I do not see that myself. I think that the supply of gold would be obtained gradually, and without any such great cost to the Government of India as has been suggested. In the first place, the opening of the mints to the coinage of gold would cost the Government nothing, except the cost of the coinage. Anybody who chose to bring gold to the mint would have it cut into a sovereign, and the Committee, of course, know that at this moment there are supposed to be something like 300,000,000*l.* sterling of gold in India. It will probably be to the advantage of some, at any rate, of the holders of that gold to bring it to the mints to be coined. Colonel Smith, the Mint Master at Madras, who was a very able authority upon coinage questions, thought that 30 or 40 millions of gold would be brought to be coined at the Indian mints, if they were opened to the coinage of gold. I do not see how the precise amount can be estimated, but that some gold would be brought in there can be no doubt. Then, again, if exchange goes up a very little above the present rate, gold will be sent to India to be exchanged for rupees. Then, again, I think, after certain notice and with every protection to individuals, the customs duties might be levied in gold, and if the Government of India went through the other items of revenue, it might be found that some of those other items might be collected in gold. Certainly the opium sales might be made for gold; there is no difficulty about that. Then I think that about three millions of gold are now produced in India. If the people who are interested in that production can manage to have the refining carried on in India they might send that gold to the Indian mints and have it coined at probably considerable profit to themselves. Therefore, I do not think there is any necessity for any large expenditure by the Government of India in order to provide gold. Some expenditure may be necessary, but it would be principally for the sake of facilitating the exchange of silver for gold and easing the rate of discount.

8431. (*Lord Balfour of Burleigh.*) I understand you have said two things—that the rupee is not necessarily to be convertible into gold, but, at the same time, it is to be legal tender for any amount—at any rate, for the present?—Yes.

8432. If it is not to be convertible, is it not absolutely certain that there will be some difference of value between the number of rupees which is to be the standard equivalent of the sovereign, and the number which you would have to give for the actual exchange into gold; in other words, will there not certainly arise some premium upon gold?—It is possible; just as in France, when the double standard existed, sometimes you had to pay a little premium upon the Napoleon.

8433. Then is it not obvious that you will have, in this case, a premium upon gold?—The real practical working of it, I take it, would be this, that silver would be, for almost all purposes, the currency of India—for the great mass of the transactions of the people.

8434. Then does it not follow that you have not, except in name, established a gold currency and a gold standard together, and that every debtor will exercise his option and pay in silver?—I do not follow the question completely. If it is meant to imply that a gold standard cannot be established while token coins of silver continue to be unlimited legal tender, unless the two are convertible, my answer would be, I think, that, in the first place, that is practically the system in France at the present moment.

8435. Does not that involve this logical result—that that is saying that the circumstances of France are the same as the circumstances of India, and that the analogy can be carried out all through?—Everybody knows, of course, that the circumstances of France are not exactly the same as the circumstances of India, but I do not think that affects this particular question, as

8436. (*Chairman.*) It is so in America too, I think?—I do not know anything about the American system. I think it would be better, in order to carry that part of the subject a little further, to say that I propose that in some way or other rupees in large sums should be convertible into gold to a limited amount. I do not think there would be any difficulty as regards internal transactions; but as to foreign exchanges, I think there is a difficulty that has to be met in some way.

8437. Then have you formed any opinion as to the ratio that we should fix?—I think the evidence that you have had is entirely in favour of fixing 1*s.* 4*d.* There is no doubt that the greatest difficulty in the whole of the scheme is whether that ratio can be kept up or not. The 1*s.* 4*d.* ratio has a good deal to recommend it. First of all it is the present ratio; apparently the trade expects that that will be the ratio fixed; the number of rupees to be exchanged for a sovereign is very convenient, one sovereign for 15 rupees, which is the same rate at which the gold mohur used to exchange for rupees; and curiously enough the subsidiary coins fit in admirably, you have one anna for one penny, and 240 annas for £1.

8438. How would the position of the currency note issue be affected by a gold standard?—That is a very difficult question, and I should be sorry to express any positive opinion about it, because I think it must be carefully considered by the Government of India when the principles are established. At the same time, I should like to say that in my own opinion something might be done by the Paper Currency Department—I mean through the present note circulation—to provide for what Lord Balfour of Burleigh suggests—namely, some convertibility of the rupee into gold. I think that it might be possible that the large notes issued by the Currency Department should be convertible into gold at the option of the holder. Those notes have been issued upon silver. The liability would not be very serious, it would be a liability which could be undertaken without any great risk. It would amount, I think, to about 6,000,000*l.* sterling. The present note circulation is 25 crores, of which rather less than half is in big notes; of those a great many are held by the Government treasuries. That would for a time, at any rate, ease the difficulty in the way of sending capital to India to finance the crops in the busy season, and it would be a liability which would not be beyond the power of the Government of India to meet; and it is a liability that need not be extended. It would be at first limited to the number of notes now in circulation. That seemed to me to be a possible way, but I beg the Committee to take this as merely a suggestion. I do not mean to say that there are not other ways and better ways of doing the same thing; but this occurred to me as a possible way of doing it, and I thought it would be more acceptable to the Committee if I examined the subject from a practical point of view, and looked at all these points to see how, supposing I had happened to be responsible for carrying out the change of standard, I should endeavour to work it.

8439. (*Sir F. Mowatt.*) Does your Lordship contemplate any special fund to meet that 6,000,000*l.* sterling which might be necessary for converting the notes?—Yes, they have now a quarter of a million of gold in the Currency Department. If more gold came in, in consequence of the rise in the rate of exchange, some of that gold might be transferred from the general balances to the Currency Department. Besides that, I should like to see some assistance given by the Imperial Government in this matter. I think a fund should be provided, so that there should be absolute certainty about the convertibility. There must not be any doubt about the matter.

8440. (*Sir D. Barbour.*) A fund in India, I understand you to say?—Yes, in India.

8441. (*Chairman.*) What would be the effect, in your judgment, of the establishment of a gold standard upon the Government rupee debt?—The closing of the mints, of course, has been a great benefit to the holders of the Government rupee debt, as I explained before. I should be sorry to say what should be done in detail with respect to that debt. The return of the different loans which is before the Committee is very complicated, and I think it is one of those subjects which must be left to be considered afterwards. The holders of the debt have gained by the action that has already been taken, and I do not very well see that they can lose by anything which may be done further in the matter.

8442. With reference to the Imperial Government supporting the Government of India, do you think there should be some assistance in some shape, either in credit or in gold?—Yes, I know it has been held by people of great authority that the Imperial Government should never use its credit to assist the Government of India; it has been said on this side, and even in India, that the independence of India would be risked, if the Imperial Government helped India in this manner. I do not attach much importance to those arguments. The fact is that the Government of India has no independence in respect to financial questions. Any important financial question is determined by the Government of England. Look at the imposition of import duties on cotton manufactures. India had no power to impose those duties, and it was a very long time before she could get the Government of England to agree to them. It was greatly due to the Chairman of this Committee that they were imposed at all; he, as Secretary of State for India, had the courage to get up in the House of Commons and declare that the interests of India ought not to be sacrificed to the interests of this country, however large.

8443. Would you wish, yourself, to make any suggestion upon that part of the subject?—Yes, I should not advocate any such assistance from the Imperial Government to the Government of India as taking the responsibility of the whole of the Indian debt. I do not think it is necessary. I think India is able to pay her way with proper management of her finances, and I think it unadvisable; it would be unpopular in this country. But when India is engaged upon a financial operation of such great difficulty and importance as the change of the standard and currency of the country, I think that is a time when, more for the moral effect—more for the purpose of giving confidence to the commercial world that the change is to be carried through—than for the financial advantage of the assistance, the support of the Imperial Government should not be confined to a mere approval of the Indian proposal. It would cost the Imperial Government nothing, because India would pay interest on whatever money was advanced to her, but in some way or other—either in the way I have just suggested to the extent of 6,000,000*l.* or 8,000,000*l.* to guarantee the convertibility of the Indian note issue, or in some way or other—I attach the highest importance to there being the moral support of the Imperial Government, and, as moral support is not of much good unless you put your hands in your pockets, that moral support should be confirmed by some liability being undertaken by the Imperial Government.

8444. There is one proposal that has been mentioned that I think I should have put to your Lordship earlier—the proposal to levy an import duty on silver?—A great many high authorities have advocated that; but, after considering it very carefully, and, if I may confess it, after at first being in favour of it, I came to a conclusion against it. I do not see why you should prevent the people in India from getting silver at a reasonable rate if they want it. I suppose the women of India are not unlike the women of other countries—they are very fond of ornaments. The women of the poorest classes wear brass bangles or bone bangles on their arms and ankles. Then, in the class a little better off, they wear silver bangles. It is quite a mistake to suppose that this is only a sort of bank into which the natives deliberately put their savings; it is just for the sake of ornamenting their

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

wives. As they get richer they get gold bangles, and when you get to the wealthy classes, they have pearls and diamonds and every sort of jewels. But I do not see why you should not let the people of India have silver at a reasonable rate if they want it, and I think a change in the standard of the country should be carried out with as little disturbance of the general interests of the people as possible. I think it might have a bad effect upon the people of India if they were told we were going to prevent them getting any more silver. It is advocated mainly, I understand, on the ground that it would prevent illicit coinage. That is a very difficult question. The Indian Government, I understand, say that there is no illicit coinage going on.

8445. Not that there is no illicit coinage, but they think that there is no excess over the average?—I hope there is none; but, at any rate, putting a high import duty on silver would not have much effect. The Committee will recollect the coast line of India and the land line of the Indian frontier. Is it reasonable to suppose that, if you put a high import duty on silver, you could prevent smuggling? I do not think it would be possible, and that would be worse, probably, than having some little illicit coinage.

8446. (*Sir D. Barbour.*) You might also mention the French and Portugese settlements in India?—Yes, I suppose you would have to get a treaty with France to prevent silver coming into Pondicherry. Another reason against the duty, and it is not one to be despised, is that it would raise opposition from a very important interest, namely, the silver interest. That is a very great interest in the world, and I would not raise any opposition of that kind, unless it were absolutely necessary.

8447. (*Chairman.*) Have you any observations to put before the Committee as to the objections which have been raised to the introduction of a gold standard into India?—Yes. The first objection is that the gold standard is not suitable to India, because India is a poor country. I really do not know what is meant by a poor country. If wealth is to be determined by revenue, or trade, or credit, I cannot admit that India is a poor country in comparison with many other countries that have a gold standard. Of course, local exchanges of commodities in India are carried out, principally, not even in silver, but in copper, and gold coins would only be used in the larger transactions. But it does not follow that gold would not be extensively used for those transactions. Another objection raised is that a gold currency is unsuitable to the Indian people. Sir Robert Giffen, in an article he wrote the other day, said there is no demand for a gold currency in India; but, in my opinion, by far the greater weight of authority is upon the other side. In order to establish this, I must trouble the Committee with a short history of what has happened in India with regard to coinage. The unit of the Hindu coinage was gold, and gold coins were in circulation before the Mahomedans came. The Mahomedans introduced the rupee, but at the same time gold coins called mohurs were freely circulated. At first, under the East India Company, gold and silver coins were both legal tender. There is a Despatch which has been laid before Parliament (I think it was moved for by the Chairman of this Committee) from the East India Company in 1806. In that Despatch you will find a very interesting piece of evidence on that matter. In paragraph 20 you will see that, under the Government of Madras, gold coins were then the principal currency, money of account, and the measure by which the pay of the troops was generally calculated. Those gold coins were of a very moderate amount; they were called star pagodas, and were worth about 8*s*. They were the currency of Madras at that time. Gold and silver coins remained in circulation as legal tender till 1835, when the silver rupee was made the sole legal tender. Notwithstanding that, a considerable amount of gold continued to be coined at Calcutta, and gold coins were received at certain rates at the Government Treasuries. A stop was put to that in 1853, but, nevertheless, gold continued to be coined; and, in 1857, the Bombay Government recommended the introduction of the sovereign as legal tender. At about the same time, there were so many English sovereigns—or, rather, Australian I think they were—introduced into some districts of Madras by labourers returning from Ceylon and Mauritius, that the Government were obliged to receive them into the Treasuries, and a gold currency based on the sovereign would rapidly have superseded the rupee currency, if the Government of India had not prevented it. That is stated by Sir Charles Trevelyan in a Minute written in 1864.* In 1864 the principal commercial associations in India recommended a gold currency—the Bombay Chamber of Commerce, the Bengal Chamber of Commerce, and the Madras Chamber of Commerce—and the Government of India in the same year recommended the introduction of the sovereign as legal tender. In 1866 the Calcutta Chamber of Commerce again recommended the introduction of the sovereign as legal tender. A Commission was then appointed to inquire into the matter, and reported that, "The demand for gold currency is unanimous throughout the country." Sir Charles Trevelyan's Minutes will be found to give the whole account of this matter, if the Committee wish to know any more about it. While I was in India, in 1872, Sir Richard Temple, who was then Financial Member of Council, wrote a Memorandum recommending a gold standard and gold currency in India. There was no man who had more experience of India all round than Sir Richard Temple. He had been in almost every part of it in responsible positions, and he would not have recommended this, if he had not believed that a gold currency was likely to be acceptable. I wrote to ask him whether he would allow me to place this Minute of his in the hands of the Committee, and he said he was quite willing that I should do so. Therefore, I put it in the hands of the Chairman, and, if he so pleases, it can be printed with your proceedings. (*For this Minute, see Appendix.*) In 1878 the Government of India recommended a gold standard, and the ultimate adoption of a gold currency. I have mentioned already that Colonel Smith, the Master of the Mint at Madras, was in favour of a gold currency. I may just add this. Perhaps some member of the Committee may say, How is it, if you had this recommendation from Sir Richard Temple in 1872, that you did not adopt it? The answer is a very simple one. That was a time when gold was appreciating, and it was impossible to do it. Then, after that came the question of bi-metallism. That, I think very properly, turned all the thoughts of the Indian Government in the direction of trying to keep the silver standard by securing an international monetary arrangement with France and the United States of America, and, therefore, the particular question of the gold standard and currency went into abeyance. But, at the same time during those discussions, when Lord Reay and Sir Louis Mallet were the representatives of the India Office at the Monetary Conference of 1881, after coming back from that inquiry *re infectâ*, without having been able to do anything, they reported that India, by adopting a gold standard, could, in a few years, obtain a supply of gold sufficient for all [illegible] of her commerce as a standard of value, and [illegible] difficulties derived their force rather from [illegible] of England and other gold-using countries [illegible] those of India itself. Now, this I want to put before the Committee. There is a remarkable fact which presents itself to me in looking back at all this again—because I knew it before—namely, that all through these papers, and all through the consideration and discussion of this question, there is hardly a single suggestion, from any one with a knowledge of India—I doubt whether there is any suggestion at all—that a gold currency would not be popular in India if other circumstances rendered it desirable. I therefore venture to think that, if the

* *See* Commons Papers No. 79 of 1865 and No. [illegible] of [illegible]

history of coinage in India is considered, the balance of authority shows that there is no ground for rejecting a gold currency as being unsuited to India. I am glad of having had an opportunity of putting this forward, because I have not seen it in evidence, nor is it elaborated in any of the publications which I have read on this subject. Another argument against a gold standard is that its cost would be enormous. I have dealt with that already; I do not admit it. I would add that the evidence given by Lord Rothschild and Sir Samuel Montagu, and the facts as to gold production, show that such gold as would be required in India could be easily supplied out of the gold production of the world. The production of gold in the world has increased in ounces from 5½ million ounces in the years from 1876 to 1880 to 12 million ounces this year. In Mr. Bryce's excellent book upon South Africa, he gives a calculation of the future supply of gold from the Transvaal. He says that "the "view of the most competent specialists is that "the value of gold to be extracted in 50 years is "about 700 million sterling, and that the produc- "tion may not fall short of 10 million sterling a year; "and, with improved economical and administrative "conditions, might reach even a larger sum." Therefore, I think that the difficulties which existed, no doubt, when gold was appreciating, need not now stand in the way of making this change. There is no reasonable probability that anything that the Government of India may do, or any reasonable quantity of gold that they may want, can seriously interfere with the gold market of the world or injure any gold standard countries. Those are the replies which occur to me to the arguments which have been used against the introduction of a gold standard and a gold currency.

8448. Do you think, taking all these circumstances into consideration, this is a suitable time to make such a change?—I cannot conceive a better time than the present. You have got the exchange up to 1*s.* 4*d.*; you have got a large production of gold, and everybody expects that some decision will be come to upon the matter. You have another great advantage in a very favourable financial year—in all probability there will be a considerable surplus which will give the Government a command of the situation to a great extent—and, taking all the circumstances together, I cannot conceive a better time to make the change than the present.

8449. Is there anything else that occurs to your Lordship to mention to us?—Yes. I have three other observations to make. One is, that, if this measure is to be carried out, the Imperial Government should give their moral support, and, to a certain extent, their material support; but there is another condition which I think ought to be secured, and upon which I hope the Committee may think it desirable to express an opinion, that the utmost steadiness should be pursued in the management of Indian finances. When you are making a great change of this sort in the currency of a nation, you ought to have command of the situation, and, as the Government in this good year are likely to have 3 crores surplus—perhaps more—I think it is almost essential to the success of this operation that they should not spend that surplus, but that they should hold it in hand to use either by, if necessary, buying gold, or in any other manner. I think it is so important a thing that, if I were Secretary for India, I should recommend the Council to issue instructions to the Government of India that the Budget of the coming year should be a temporary Budget. A new Viceroy is going out, and a new Finance Minister, and this great measure is to be carried out. I think the Government should be told not to remit taxes. Although I should like to see the salt tax reduced, yet I would not make any reduction at this time, because the people are fairly prosperous, the terrible calamities of famine and war have passed, and the calamity of plague is, I hope, passing away. But, above all things, I should insist that there should be no increased expenditure—that the Indian Government should not authorise an increase of expenditure of any kind in the coming year—that they should resist the applications of the Military Department, and postpone everything for another year, until this matter is settled; and in the same way with the other departments of the Government. I know well enough the pressure there is, when there is a surplus, for increase of expenditure of all kinds; but, if the Government deliberately say that, in the face of this affair, they will not increase expenditure—I do not mean to push it to a pedantic extent, but to any considerable amount—I think they would be doing a wise thing, and doing what is the most important, and almost the essential, thing in order to carry this great change satisfactorily into effect. I attach the greatest weight to this. In the same way, at home, I would take care to increase none of the gold liabilities. I would not for the time enter into any arrangements which would increase the gold liabilities of India in this country. I would say, this is a moment in which we must be steady in our finances, and get command of the situation. The only other observation I desire to make is in relation to the effect of this change, if it is carried out, upon the policy of having an international arrangement as to the opening of the mints of the United States and France to the coinage of silver at a certain ratio with gold. I have seen it stated that there is some prospect that France and the United States might consent to opening their mints to silver, at a ratio of 1 to 22, instead of 1 to 15½, which was an impracticable proposal. If that were carried out, the ratio of 1 to 22 would be the same as the 16*d.* ratio for the rupee. If I were asked what effect the proposals which I have made for the introduction of a gold standard and currency into India would have upon that, I should say, in the first place, that it need not interfere with such an arrangement. We should be exactly in the same position in India as France is now in. We should have a gold standard with a gold currency, and a silver token currency circulating alongside of gold. There would be no difference between India and France with respect to opening the mints to silver, if it should be desirable to do so. And, moreover, if it is a question whether there would be more probability of carrying out such an international arrangement through India having done this, instead of opening her mints now to silver, as some propose, I say India would be in a stronger position than if she opened her mints to silver. If she opened her mints to silver to-day, she would have nothing to offer. I have no knowledge that such an international arrangement is at all likely to take place. If my opinion were asked, I should say it is improbable; but I think it is desirable to show that the change of standard would not interfere with an international bi-metallic arrangement, because a very powerful interest in this country, and a great number of very able men, including several members of the present Government, are bi-metallists, and I want to show that, from their point of view, no obstacle is put in the way of carrying out their views, supposing they should turn out to be sound, by the alteration of the Indian standard.

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

8450. Now, have you any observations to offer us on the working of the Indian Currency Department?—I do not know whether the Committee would like to hear what I have to say about this, but I have seen some evidence by Lord Rothschild and others as to the management of the cash balances in India, and I observe that the idea is put forward that there should be a great bank in India like the Bank of England, which would manage the currency, and have the full use of the Government balances. I should like to say something upon this subject. It is a difficult question, and I want to point out to the Committee that it was very fully considered about the year 1861, when I happened to be Under Secretary, and Lord Halifax (then Sir Charles Wood) was Secretary of State for India. The whole history will

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

be found in papers laid before Parliament at that time.* Sir Charles Wood had a strong opinion that the note issue should be entirely separate from the banks, and that it should be managed by a Government Department. After a very long argument (because Mr. Laing, who was then Finance Minister in India, took the other view) the present system was established, and I should be exceedingly doubtful as to the policy of altering the present system, after it had been so fully considered by so great an authority in all currency matters as Sir Charles Wood was. Now, as to the arrangements with the different banks, as the Committee know, the Bank of Bengal, the Bank of Bombay, and the Bank of Madras are, to a certain extent, Government departments. The Government have a strong hold upon them. They had at one time, at any rate, representatives on the management of the banks. The Bank of Bengal, which I had mainly to do with, was managed exceedingly well, and we had every confidence in its transactions. But, at the same time, I do not think that these banks, in their present condition, have the capital or the strength which would enable the Government to treat them in the same way as the Bank of England is treated in this country. The Bank of England is the product of a great number of years, and it has the absolute confidence of the Government and the public. There is no reasonable probability of establishing a bank, in my opinion, that could occupy the same position in India. As regards mixing up the currency with the banking business, it must be remembered that, although commercial crises in this country have been met by allowing the issue of notes by the Bank of England beyond the statutory limit, that would not do for India. In a crisis in India you want rupees, you want the actual money for payments up country. I can give the Committee an instance of what happened to me in connexion with this particular subject. In the year 1874 there was a famine in Bengal, and in order to feed the people we had to buy rice in Burma and send it to Bengal. In order to get the rice we had to pay hard coin, rupees, for it. The banks then had the full use of the Government balances, and the Bank of Bombay had at that time more than a million tens of rupees—a million and a half I believe—of the Government balances. In order to pay for the rice, we wanted some of this money. When we asked the Bank for it, we had the greatest difficulty in getting it. The Government of Bombay objected, and it was only after considerable correspondence and by insisting upon getting our money that we got at last about half a million of the million and a half that they had of our balances. It was so serious a condition of things for the Government of India not to be able to get their money when they wanted it, that we addressed the Secretary of State on the subject, and the correspondence is given in the evidence published in the first Report of a Commission now sitting on Indian expenditure, at Question 2805. We said:—"We have been much impressed with the "consideration that the effect of the existing agree- "ments with the banks, which compels us to place "all the cash balances belonging to Government in "their hands, leads to consequences which may be "very inconvenient, if not worse, both to Government "and to trade. The only use of these balances to "Government is that they may be made available "the moment the public service requires them. We "have had no difficulty in regard to the balances in "the hands of the Banks of Bengal and Madras; "the Bank of Bombay, however, protested against "meeting drafts upon it, and, on the urgent repre- "sentations of the Governor of Bombay, we were "obliged on the 29th January to allow a month's "time before drawing. The Bank of Bombay, "accustomed to high Government balances and "relying on the maintenance of these balances, had "so employed them that they were practically locked "up; for, had we insisted on withdrawing them "more suddenly, we should have done so in the face "of a warning that we should produce a commercial "crisis, and, therefore, for a time, the Government "balances at Bombay were useless for the purposes "of the Government." The upshot of it all was that an alteration was made, and at our recommendation the Government now hold about 2 crores in the reserve Treasury. They are not bound now to keep the whole of their balances in the banks, and they keep 2 crores actually in their own hands, which they can use on an emergency. I do not think it is safe for the Government of India not to have the absolute command of 2 crores of rupees.

8451. At each bank do you mean?—No, 2 crores altogether. I do not think it is at all an unreasonable amount, and it is not safe to have less. The Government of India are in quite a different position to the Government of England. The Government of India, if they want money, could not get it in India to any considerable extent, and, if they tried to get it and failed, it would bring them into great discredit. Therefore, I do not think the Government should be bound to keep the whole of their balances in the banks. It is not, in my opinion, the business of the Government of India to finance Indian trade; it is the business of commerce to finance Indian trade. At the same time I do not see why the Government of India should not to any reasonable extent assist trade by allowing the use of their balances by the Presidency banks with proper precautions; but I want to point out that it is not safe to put the whole of the balances in the hands of the banks, judging by the experience that I myself have had. Then, as regards the recent stringency of the money markets in India—I think that the recent stringency must to some extent, at any rate, have been caused by the closing of the mints—possibly not to the full extent which some people think, but, at the same time, to some extent. The grounds on which I come to that conclusion are these. Suppose anyone wanted rupees to finance the rice or jute crop in India, he could not buy silver in the market on credit and take it to the mints and get rupees, because of the closing of the mints. It is said, Why could they not send gold from England, with which they could get at a certain rate rupees in India from the Government treasuries? I think the answer is simple; they might lose money if they did so, because they could not tell whether the exchange would keep up, and they would not know that they might not lose money when they came to send their money back again. Therefore, I think, the closure of the mints has had something to do with the stringency. Well, I think the Government are bound, to the best of their ability, so far as it is safe to the Indian finances, to take care that this does not occur again. I think that in this transition time (I do not say you should do it in ordinary times) when there has been a tightness, in my opinion partly caused by the closing of the mints, the Government should meet it in some way or other. It is a bad thing even for the commerce of the country, because it is a charge on the export trade. I hope, when the gold standard and the gold currency work effectively, you will get rid of the difficulty, but in the interim I should like to see some plan carried out to meet it. I will suggest no particular plan, because that is a matter which ought to be left to the Government to decide. I do not think I have any other observation to make upon that. I could say more about this banking question, but it is a matter of detail, and it hardly really comes within the limits of the questions referred to this Committee.

8452. Do you think gold would flow out of India?—I do not see any reason to suppose that gold would flow out of India; of course, it must flow in and flow out. When there is a gold standard, if the exports fail, as they did in the time of the famine and the plague, gold will go out of India, it cannot be helped; but in ordinary years I do not see any reason why it should. All the statistics show that

* *See* Commons' Paper, No. 109 of 1864. East India Paper (Currency, &c.).

India for a long series of years has been a large importer of bullion, and that will continue, I think.

8453. I should have put it "an abnormal flow" ?—I see no reason to anticipate it.

8454. (*Sir D. Barbour.*) You mentioned what the probable cost would be to the Government of India if the mints were opened to silver; you put it that 10 or 12 crores would have to be found. But if there is a surplus at the exchange of 1*s.* 4*d.* of, say, 4 crores for the sake of argument, that surplus would be available to meet a portion of the total cost?—No, that would be a surplus for one year, and you must look at the future.

8455. I am assuming that it is a permanent surplus? —I do not think anybody who knows anything about the finances of India can rely on a permanent surplus.

8456. That depends on circumstances; but, if in the present year the 1*s.* 4*d.* rate of exchange gave you a surplus of 4 crores, and that surplus were a permanent one, it would be available to meet a portion of the extra cost?—Yes, that is a mere matter of arithmetic; but if you ask me whether it is desirable that it should be so used, I have an answer to give. Undoubtedly, as a fact, if there should be a surplus, it would be available.

8457. If it were decided to take some further steps at once to establish the gold standard, it would be necessary, would it not, to decide, once for all, on the ratio between the silver rupee and gold—to decide finally?—In establishing the gold standard, it would be necessary to decide on the ratio. When you ask me whether it is necessary to decide finally, I think my answer again is, Yes, it should be decided finally.

8458. You know that the rate of exchange at present is about 1*s.* 4*d.* ?—Yes.

8459. I suppose you would admit that, if there was considerable borrowing by India at any particular time, that would help to keep up the rate of exchange so long as the borrowing lasted?—Certainly; it would reduce the amount of Council bills that would have to be drawn.

8460. Also if there was an unusually good export trade from India, that would help to keep up the rate of exchange?—Certainly.

8461. I daresay you are aware that there is considerable borrowing this year? — I did not know it.

8462. You may take it from me that there is considerable borrowing, according to the figures that have been put before the Committee. You have also stated that this is a good export year?—I believe so. Certainly a great quantity of wheat has been exported.

8463. Those two causes, either to a greater or less extent, are keeping up the exchange at the present time?—I should think, certainly, it must have a great effect upon it.

8464. Therefore, it may be that, if conditions were normal, the exchange would not be 1*s.* 4*d.* ?—Yes. That is to say, it might be that, under other conditions—I do not say if the conditions were normal, but under unfavourable conditions — the exchange might go down. I admit that.

8465. If you fixed 1*s.* 4*d.* now, and under the conditions that prevailed during the next 5 or 10 years there was a tendency for exchange to fall, you might have considerable difficulty in making that rate effective? — Yes, that is the greatest difficulty in the whole matter—whether you can keep up the exchange to 1*s.* 4*d.* or not. It is a difficult point, I admit. My feeling is that it is quite possible that, as in any great change of this sort, you may meet with some difficulties before it is carried through; but, at the same time, I think that, as the Government of India have closed the mints, they have command of the situation, and they cannot help, in the end, establishing the 1*s.* 4*d.* rate.

8466. I suppose you are not prepared to say positively whether or not those difficulties would be experienced, or how great they would be?—We must be prepared for difficulties, and that is one reason why I consider that we ought to have a considerable surplus in hand; but I do not see how the Government of India can be defeated if they steadily stick to their plan, because they have the command at the other end of the stick, as you may say — they have the command of the coinage of silver, and any supplement to the coinage would come automatically through gold.

8467. You made a suggestion that some of the higher notes that are issued already might be payable in gold?—Yes.

8468. These notes have been issued in this way: A man paid 10,000 rupees in silver into the Currency Department, and got a note for 10,000 rupees. If he presented that note for conversion now, he would get out the 10,000 rupees?—Yes, he has a right to get rupees for it.

8469. You propose to give him gold if he asks for it?—I must beg the Committee to think that that is merely a suggestion thrown out by me. I do not attach any final importance to it, providing some other way is found which may be better to convert, to a certain extent, rupees in large amounts into gold.

8470. When that note had been cashed for gold, there would then be 10,000 rupees available for any purpose in the Currency Department?—Yes.

8471. Would you propose to keep them?—Yes, I should not let them out.

8472. To that extent you would contract the currency? — Yes. I do not mind contracting the currency, provided you have an automatic system. I have a strong objection to contracting any currency when there is no automatic system for meeting the demand; but I do not mind if we have a gold standard with a gold currency, because the difficulty could be met by the coinage of gold.

8473. And I suppose you would agree that, as a matter of theory, it is quite sound and quite safe to say that, if you continue contracting the rupee currency, you must raise the value of the rupee in gold?—Well, I hope the value of the rupee will remain quite steady. I do not want to raise the value of the rupee.

8474. But you would wish to prevent it from falling below 1*s.* 4*d.* ?—Yes. Whether there may not be variations before you arrive at it, I would not say; but you would do it in the end.

8475. I asked you that question because it has been said that it is impossible for India to have a gold standard or a gold currency, on account of the magnitude of the foreign payments she has to make?—The whole tendency of my evidence is that, having considered it, I believe it to be both possible and practicable.

8476. I understand you to contemplate that the legal tender of silver rupees should be limited at some future period?—Yes, but I should be sorry to say when.

8477. Is there any very great necessity for making a change of that sort quickly?—I do not see any necessity.

8478. What harm would arise from the silver rupees continuing to be full legal tender?—I do not see that any great harm would arise. But I do not think that the French system of currency is as good as the English system, and I should prefer to see, as far as possible, the Indian system assimilated to the English system. That would involve some limitation of the amount for which the rupee is to be legal tender; but I do not think that this is at all an urgent matter.

8479. Now you were asked whether, if silver rupees were not convertible into gold, there might be a divergence in the value of the silver rupee and the sovereign?—Yes.

8480. I think you are opposed to the Government undertaking to convert rupees into gold to an unlimited extent?—I do not think they could. That is the objection I make to Mr. Lindsay's plan. I think that is a liability which the Government would decline to undertake.

8481. A man who holds silver coin in this country is not entitled to go and demand gold?—Certainly not.

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

8482. Nevertheless, the silver coin maintains its value with reference to the sovereign?—Yes, but I do not think silver coinage in England is quite analogous to the rupee token coinage in India in respect of the amount of circulation.

8483. But I merely wish to bring out the fact that the value is maintained, although there is no legal convertibility?—Yes.

8484. It is possible under certain conditions to maintain the full value, though there is not legal convertibility?—I should like to say something more upon that question of the possibility that there may be a difference in value between the token coin and the sovereign. I do not see that there is any likelihood of the silver token coinage being of greater value than the sovereign, for the sovereign would be exchangeable for 15 rupees at the Government treasuries. If it should be so, that might be a danger to India, because it would have a tendency to lower prices; but I do not see any danger of that, because, the Government having the command of the coinage of silver, if they saw any demand for rupees, they could coin more. I do not see that the danger can arise.

8485. The shilling is kept at $\frac{1}{20}$th of the £ because the coinage is limited. If you coined shillings to an unlimited extent and issued them, you would probably find that they depreciated?—I am not certain what would happen then.

8486. There would certainly be some change?—I cannot conceive the English Government doing that. I suppose that, if they did so foolish a thing as that, the shilling would depreciate, perhaps, to sixpence. You might have to give two shillings instead of one.

8487. If they issued silver coins to an unlimited extent, those silver coins would accumulate in the banks or in the hands of certain persons, and, in order to get rid of them, they would have to offer them at a lower rate; that is, the silver coins would depreciate?—I suppose so.

8488. So that what keeps the silver shilling at its full value—$\frac{1}{20}$th of a sovereign—is the limitation of the coinage?—Yes.

8489. (*Mr. Holland.*) I think you said that the closure of the mints was, in your opinion, justifiable, and had not been accompanied by any serious interference with private interests?—Yes. Bear in mind that I use the word "serious."

8490. You are aware that we have had it in evidence before this Committee, that the great stringency in the money market, that has occurred in consequence of the closing of the mints, has been a most serious hindrance to some branches of trade?—I admit that the stringency was partly caused by the action of the Government in closing the mints—not altogether, for it was partly caused by a quantity of rupees having to be sent up country for the war and famine. At the same time, if you look at the diagram which has been placed before the Committee, the rise in the rate of discount was not very abnormal. There have been equally high rises in several years before this happened. It seems to be rather a chronic thing in the money market in the Presidency towns. I cannot explain it; I do not know enough about the business of banks to be able to say why it should be so. I suppose some people make money out of it, but for the country it is a bad thing. I do not consider that it was a very serious matter, but I admit that the stringency was partially caused by the closing of the mints, and I hope that a remedy can be found for it.

8491. Am I right in understanding that you are in favour of immediate action being taken, or would you rather wait?—If I had the power of settling this question, I should not hesitate at once to make the sovereign legal tender in India, and to open the mints for the coinage of gold. I do not suppose the Government can do that, but if I could do it, I would go at once that far, and no further.

8492. If the Chairman thinks it a proper question, I should like to ask you whether your views would undergo any change with regard to the question of re-opening the Indian mints, provided the mints of the United States and France were themselves re-opened; would that modify your opposition to the re-opening of the Indian mints?—No. Suppose you had an international bi-metallic arrangement with the United States and France to open their mints to silver at 22 to 1, I think it would become a practical question for the Government of India to consider whether they might not re-open their mints, but I would not re-open the Indian mints now with a view of coming to that arrangement, because I think it would do more harm than good.

8493. (*Sir A. Dent.*) You were discussing with Sir David Barbour just now about these large notes that might be converted into gold. Do you say that there is any evidence that large notes do exist in the hands of the public?—Yes, I think so.

8494. I do not think they are held by the Eastern banks, at any rate?—If you would like to see the detail of it, it will be found in the last Report of the Paper Currency Department. I looked through that Report, and I found that there was a very considerable amount of large notes in the hands of the public—I mean, of notes of 500 rupees and over. Of the bigger notes, a certain portion are held in the Government Treasuries. Still, there is a considerable balance, because the liability I made out would be about six million pounds sterling; that would mean about 9 or 10 crores of these notes out.

8495. Would you suppose these notes are held by the bankers or the native princes?—I should doubt whether the native princes hold our currency notes; I should think they are mostly in the hands of bankers in India, but I do not know.

8496. I do not think that any of the Eastern banks hold any number of them?—I do not know, I cannot say of my own knowledge.

8497. Then, you say, you are opposed to export duties, and you say it would be suicidal to tax tea?—I did not mean suicidal particularly with regard to tea. "Suicidal" was rather a strong term perhaps, but the export duties would certainly check the increase of the export trade, and, therefore, it would be against the interests of India to impose export duties.

8498. But, looking at it for a moment from the tea planter's point of view—the tea planter maintains that he is enormously taxed already in the exchange, and he would sooner have an export duty on tea than a high rate of exchange. I was trying to find an answer to the complaint of the Indian and Ceylon tea planter—perhaps your Lordship can help me?—I have read the evidence as to tea with great interest. I take a very great interest in the extension of the tea trade in India. I have been up in Assam and seen the gardens there; it is one of the most valuable additions we have had to the exports of India. The way in which the Indian and Ceylon tea has knocked out China tea in various markets is really wonderful. But on reading the evidence through, I cannot say that I think the complaints of the tea planters were justified, except to some small extent which I will explain directly. I do not see that the people who invested their money in tea had any right to reckon upon a profit from the continuous fall of exchange. They invested their money when exchange was at a certain rate, and, I suppose, they would expect to make a profit in the ordinary way; but I do not think they had any right to reckon upon a continuous fall of exchange. Nearly all the money invested by the tea planters must have been invested when the rate of exchange was as high as, or higher than, it now is. It is now about 1*s.* 4*d.* The average rate of exchange for the four or five years before 1893, when the mints were closed, was a little above that—about 1*s.* 4½*d.*, I think. For a year perhaps before the mints were closed, exchange went down lower. But I do not think that any man of business would have invested money during that time, expecting that the rates would remain low. I do not see how he would have been justified in doing so, because Sir David Barbour, in

introducing the Budget of 1891, gave a distinct warning that in all probability the mints would be closed. Therefore, people investing money in tea speculations in India at that time should have known what to expect. So that I do not think that, as regards that, the tea-planting interest have any fair ground of complaint. I am very sorry that they will not have the advantage of the further fall of exchange, but that would be an additional profit which they had no right to expect. I should be glad if they could have it, but I do not see what right they have to complain and to demand that we should do what is very injurious, in my opinion, to the whole of the interests of India, in order to give them a profit upon which they had no right to count. That is on the general argument of the tea planters. As regards the particular argument that they are put into unfair competition with China, I admit theoretically at once that, if we stop the fall in the gold price of silver in India, it would be a disadvantage to the Indian trade in a particular article as compared with the trade in a silver standard country in the same article, but I must add a great qualification to that; I must add "other things being equal." Other things, as far as I can make out, are not equal in China. It appears there is an export duty on tea in China, and it also appears from the latest information before the Committee that the prices in the coin of the country—the "copper cash," as they call it—have gone up: so that, although they might be put to some disadvantage, —I do not say that there is not some disadvantage—still, it is not anything like so great as if things had been equal between India and China. That is the way in which I look at it. And, moreover, I do not think myself that the tea planters need be afraid of China competition. There must be exactly the same difficulty about the investment of capital in China as there has been in India. People would be afraid of sending capital to a country when they are not sure at what rate of exchange they will get it back again. Besides, you have in China four countries, all gold standard countries—France, England, Germany, and Russia—apparently doing what they can to get as much out of China as possible. When they establish a system of currency, they are just as likely, I think, to take gold as silver for the standard. If I had tea gardens, I do not think that I should be afraid of Chinese competition; but I am not really interested in tea, and this I give only as an opinion.

8499. The duty which the Chinese Government impose, $2\frac{1}{2}$ taels, might be removed in order to improve the industry in China?—Certainly.

8500. And that would hit Ceylon again?—Of course it would. I am speaking of the present condition of things. Pray understand, I have every sympathy with the tea trade, but I am inclined to think, judging from the evidence, that it has been a little overdone.

8501. It is a very important industry, no doubt, and the Government should assist it in every way possible?—Certainly, I entirely agree.

8502. (*Mr. Campbell.*) We have heard a good deal about large sterling borrowing in order to establish a gold currency. You do not propose borrowing?—I should make the change, if I could, without borrowing. I do not like increasing the gold liabilities.

8503. You would rely on trade influences and upon the internal supply of gold?—I should hope that that would, at any rate to a very great extent, meet the difficulty. Of course, I can not be positive about it—it is uncertain.

8504. As regards the stock of gold in India, which is, no doubt, very large, you are, of course, aware that the market price of that gold is higher than the Government ratio of 15 rupees to the sovereign?—Yes.

8505. Do you think it likely that the natives would send that gold in at the rate of 15 rupees to the sovereign when the market value is, perhaps, $15\frac{1}{2}$?—I think, if exchange goes up, there will not be that difficulty.

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1878.

8506. But exchange cannot go beyond 1*s.* 4*d.*?—It may go to 1*s.* $4\frac{5}{32}$*d.*, I think; it can go up to the extent of the cost of insurance and freight.

8507. But I think the natives have bought their gold at a higher price than even that would represent?—I did not know that.

8508. As regards the external supply, the gold that would come from England, that would depend upon trade influences?—Yes, for the sake of getting rupees to carry on the trade.

8509. But the ratio there is a very important part of the question, is it not?—Very.

8510. If the 1*s.* 4*d.* ratio tended to restrict the balance of trade, so that India could not command gold at that ratio, the idea of establishing a gold standard would fail?—It might fail in respect of the gold currency; you might have a difficulty in getting the gold currency, but I do not see why a gold standard should fail.

8511. Of course, to make the Government scheme successful, they must not only sell their Council bills at 1*s.* 4*d.*, but they must command a balance of trade sufficient to supply India with currency as well?—Yes, there must be a considerable balance besides the Government remittances, because there are the private remittances. I think they are calculated at about 3,000,000*l.* In a good year—this year for instance—when the balance of exports will probably exceed all the remittances, if I were managing the finances here, I should increase the drafts upon India in order to get more gold.

8512. In the last five years, we have seen that the exchange has gone very much below 1*s.* 4*d.*?—Yes, Last year we had famine and plague, and a diminution of exports, and everything against exchange that could possibly be conceived. I hope that, after so long a famine as this last one, we may rely fairly confidently upon a series of good years. It is very rare that so extensive a famine as that is repeated within a short time. We have had a bad famine after a small famine. For instance, there was a famine in 1873–4, and afterwards there was the big famine of 1877–8; but the famine in 1873–4 was only over a very limited area. We can only hope that we shall not soon have a recurrence of such calamities as we have had this last year or two.

8513. This year has undoubtedly been favourable to the proposals of the Government of India?—Very favourable.

8514. And that condition may not last?—Certainly. I think the tendency of your questions is, that we cannot be positive that the 1*s.* 4*d.* rate can be kept up. I quite agree with you. I hope it may, and I think there is a reasonable probability of its being kept up. At the same time, if it is not kept up, we must fight it out as best we can. There are ways of fighting it out that it is hardly necessary to go into, but, in any event, I should not alter the rate. Having the command, as I said before, of the other end of the stick, having the command of the coinage of rupees, I think with coolness and deliberation the rate can be maintained.

8515. You would take artificial means, then, to maintain it?—Yes; because, having got a gold standard, and there being free coinage of gold at the mints, you cannot have scarcity of currency; but the thing I am afraid of now is that, as there is no free coinage, there is no automatic adjustment of the currency of the country.

8516. You would rather fight it out by artificial means than, say, put the rate down to 1*s.* 3*d.*?—I think a good financier ought to be able to get over the difficulty.

8517. Of course, it is on trade influences that you must ultimately depend?—Yes. It all depends on the proportion between exports and imports of India. I do not want to discourage the imports, but everything that can be done to encourage exports ought to be done as soon as possible.

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

8518. You would not recommend waiting to see the result of the coming busy season?—I do not suppose that the question can be settled before the next busy season. This Committee has to conclude its labours and to make its report, and then Parliament may have to be consulted; and although I should like to see it done at once, I do not see how this can be.

8519. As regards cashing these large notes, you say that that would be done from gold that had been received into the Treasury?—I think I may put it in this way. Whatever the liability may be, 6,000,000*l.* sterling or something of that sort, I would make arrangements with the Imperial Government—supposing the plan I have suggested were carried out—to be able to draw upon them to that amount. I do not think we should want to hold it, but there should be a guarantee that it would be there in readiness. I do not suppose it would signify whether the notes were paid by bills in London or by gold over the counter.

8520. It would involve sterling borrowing to that extent?—Yes.

8521. Have you considered that these large notes might be cashed in order to find gold for export?—As I said before, I think it is very likely that a cleverer way might be found of doing it than that which I have suggested. I am not at all wedded to this particular plan. What I felt was that, if I was to be examined upon this question, I should be of no use to the Committee unless I had taken these questions, and found some practical way of dealing with each of them; so I went through each, and whatever suggested itself to me as possible, I have mentioned. I do not pledge myself to details. For instance, if I was asked whether we should have subsidiary gold coins to the sovereign, my answer would be that I should, as soon as it appeared that there was a want of small coins in circulation.

8522. (*Chairman.*) After all, that would be a question for the Government of India?—As I have said, these are questions on which I do not venture to offer any dogmatic opinion at all, or make any suggestion, except to show that I have looked into the matter as well as I could, to see how it could be worked through.

8523. (*Mr. Hambro.*) It was put to you by Sir David Barbour, that, if we had an unlimited coinage of shillings, we might depreciate the value of the shillings in relation to the sovereign; but I understand that you would allow silver to be unlimited tender?—Yes, but not unlimited in quantity—unlimited as legal tender.

8524. Therefore, it never could go to a discount?—No, the conditions of the two coins are entirely different. So long as the rupee is an unlimited tender, the conditions of the two subsidiary coins are so different that it is difficult to compare them.

(*Sir David Barbour.*) If they were so largely coined as to drive out all the gold, they would go to a discount.

8525. (*Mr. Hambro.*) I think you may say that the 5-franc piece is practically unlimited tender in France, but I have never known the 5-franc piece in France to be at a discount as regards paying debts?—It could not be, because it is legal tender. The condition used to be that, if you wanted a few napoleons to put into your pocket for travelling, you had to pay a little *agio*. I am talking of 40 years ago, before the change of standard, when there was a double standard in France; you had to pay so many sous on each napoleon.

8526. As a matter of fact, the National Bank of France will always supply local traders with gold against notes, though they might charge a premium for a large amount of gold for export?—They have the command of the situation, in the same way that I think we shall have the command of the situation in India. We must not be bound to give gold for rupees.

8527. But do you not think that the fact that the Bank of France, with its great power, has always been able to grant any facilities required, and at the same time to charge an *agio* to anybody who wanted gold for export, is a protection to the currency that could hardly be performed by Government?—I agree. The Government would not be clever enough to do that.

8528. And do you not think that the strength and the large amount of capital of the Bank of France are among the reasons why the dual method of paying in silver or gold has been able to be carried on in France so easily?—I should not like to express an opinion about French finance, because I do not know enough about it to be able to express an opinion which would be worth having.

8529. Sir David Barbour's point was that the one coin would depreciate as compared with the other, but it would not depreciate for external purposes?—I think there is this element of uncertainty at the present time. No one can say whether there is scarcity or redundancy of rupees. The Government think there is redundancy. People who know the Indian trade very well have come here and said that there is rather scarcity than redundancy. I say that is an element of uncertainty in the calculation. If there is a large redundancy, you would have to buy up the rupees to reduce the redundancy. But I do not think you will have to do that; it is impossible to tell.

8530. I understand you would make gold an unlimited tender for a certain time?—I think that is essential.

8531. And silver at the same time?—Yes.

8532. And what would you do with regard to notes?—Just as is done now.

8533. Would you allow them to continue to be legal payment?—If you keep on your note circulation, you must allow it. Any system of note circulation that might be devised, and which might turn out to be the best, might be adopted; for instance, you might have notes of different colours, one colour of note for gold, and another colour of note for silver.

8534. If you issued two sorts of notes, you might have a premium on one versus the other?—No doubt you might; but those are matters which must be thoroughly worked out. At first I thought that notes ought in future to be only issued for gold, but I am not sure whether you might not go on issuing notes, if they are popular, for silver in the lower denominations.

8535. I rather understood you to say that you did not think a bank, however strong, should be made the custodian of the currency of the country?—Just so.

8536. You think it should remain in the hands of the Government?—Yes, in the condition of India. Unless I heard something that would lead me to a different conclusion, I think that Sir Charles Wood's method was right.

8537. Is that because the Presidency banks are not strong enough?—Partly. Partly also because there is no essential connexion between the note system of the country and commercial transactions. As I understand, at the Bank of England the note issue department is quite a separate business from the other.

8538. It is absolutely separate at the Bank of England?—Then I am right in that; it is a separate business, and, on the whole, in India I think Sir Charles Wood was right in making it not only a separate business but a separate department. But I do not say that my opinion is of any great value in that matter, because things may have changed very much in India in the last 25 years, since I was there; therefore I would not express that opinion with any degree of positiveness.

8539. (*Sir C. Crosthwaite.*) You said that, if you had the power, you would take action at once by declaring the sovereign legal tender in India, and opening the mints to gold?—Yes.

8540. You would also, I understand, fix the ratio at 1*s.* 4*d.*?—Yes.

8541. Do you think there is any practical difference between the present position of the sovereign, which the Government Treasury will receive at 15 rupees,

and that which it would obtain by being made full legal tender?—Yes, I think there is a difference—a distinct and an essential difference—because, unless you make the gold legal tender and you open the mints, you have no automatic system of currency. That is the reason I think it is essential to open the mints to the coinage of gold, and the sooner it is done the better.

8542. But anyone now may bring sovereigns to the Treasury and get rupees for them. Is not that the same thing as a practical result?—I do not think it is. I do not think it is the same, unless by law a particular quantity of a particular metal is the standard of value and legal tender for everything. I think the arrangement now in force to give rupees for gold at the Government treasuries may bring in a certain quantity of gold, and I do not suggest that it should be given up, but there is an essential difference between the two things.

8543. With regard to the difficulty you admitted there might be in keeping the rupee up to the 1*s.* 4*d.* value, does not any objection made on this ground apply in principle, if not in degree, to any ratio that you might adopt, which was in excess of the intrinsic value of the rupee?—I think so. As to the question of rate, I think it is for those who wish to have another rate to bring forward their arguments. The *onus probandi* is upon those who think a 1*s.* 3*d.* rate or a 1*s.* 6*d.* rate is better than a 1*s.* 4*d.* rate. I should object to a higher rate than 1*s.* 4*d.*, for it would disturb trade. I do not see why you are not as able to keep the rate at 1*s.* 4*d.* as at 1*s.* 3*d.*

8544. (*Mr. Le Marchant.*) In alluding to the closing of the mints as not appearing to have interfered with private interests, were you looking chiefly at the evidence as to the effect on prices? Is it your view that the evidence given before this Committee did not point to any material alteration?—I tried to look at it all round. I beg to remind the Committee that I said any "serious" interference. I do not think you can make a change of that sort without some interference, but I think the interference in this case was probably as little as could have followed any important change of that kind. I looked to the interests of the payers of taxes in India and to the interests of trade and to the interests of the holders of silver, and all round to the different interests, and I cannot say that I think there has been any very serious interference with any interest by the closing of the mints.

8545. With reference to the Minute of Sir Richard Temple recommending the introduction of a gold standard, may I ask if any proposition was then made to limit the coinage of rupees?—We did not get as far as that. Sir Richard Temple wrote this Memorandum; it is some time ago, but I see from a note on the papers that we considered it in Council when I was Governor-General, and I believe the practical objections were so great in the then state of the production of gold that it was not thought worth while to pursue the subject further. I brought forward that Minute to-day to show the Committee that in 1872 there was a man who was Finance Minister in India, and whose knowledge of India was as great as that of any man at that time, who did not suppose that there was any popular objection to a gold currency. It was meant to support my argument that a great many of the very highest authorities that could be found considered that a gold currency would be practicable and popular in India. That is the point that I wanted to try and establish as far as I could before this Committee. I do not bind myself to everything in Sir Richard Temple's Minute. He is a very able man and he put his own views forward.

8546. I think you stated that, in your opinion, one essential condition was that the Government of India should pursue a perfectly steady financial policy; that sterling borrowing should be curtailed as far as possible, and a surplus secured and retained?—I am very strongly of that opinion.

8547. Is it in your recollection that Sir David Barbour, in introducing the measure of 1893, concluded his speech with a very similar recommendation?—I am very glad to be reminded of that. I did not hear Sir David Barbour's speech, because I was not in India then, but I have no doubt he will be of the same opinion as myself, having been so long the Financial Member of the Council of the Viceroy. *Rt. Hon Earl of Northbrook, G.C.S.I.* 4 Nov. 1898.

8548. So that, in supporting that view, it will be continuing the policy then recommended and adopted?—Yes; and I may say, although Sir David Barbour is present, that I know pretty well how he was brought to the conclusion he arrived at about closing the mints. As I understand the whole of his policy, he was not in favour of altering the standard from silver to gold. He wanted to have, if he could, an international bimetallic arrangement. It was only upon the failure to obtain such an arrangement that he was forced to advise the closure of the mints to silver for the purpose of establishing a gold standard. I think it is a very strong argument indeed, that the Government of India, while being by no means in favour of the gold standard, found themselves bound by circumstances to come to it, as the only possible solution of the difficulties they were in.

8549. May the Committee take it, from your other remarks, that, if Government were able to obtain a substantial surplus, you would not recommend the withdrawal of it from the uses of trade in the country—that there would be no connexion between the mode of employing that surplus and restriction of the currency available for circulation?—The Government of India are bound to see that they have the command of a certain sum of money, without putting it in the power of the banks to tie it up even for a limited time. I am speaking about those two crores which are kept in the reserve treasury. With regard to the rest of the balances beyond what is required to work the finance of India, I do not see why the greater portion should not be in the hands of the Presidency banks.

8550. So that it would be no interference with the general interests of trade in any way?—Certainly; I do not want to tie up this balance in a bag and sit upon it. I think that would be a foolish thing to do.

8551. (*Sir F. Mowatt.*) I was away when you were speaking about the land settlement, and you expressed the general opinion that it would be a very serious thing to interfere with that in any way. If you have not answered the question, let me ask you this: As I understand Mr. Ralli and one or two gentlemen who support him, what they proposed was this: that, as particular holdings fell in, it should be taken into consideration that the rupee had changed in value since. Not that there should be a general alteration in the settlement; but, as each settlement came up, the Government would be at liberty to urge that the rupee had become of a different value since the last settlement. Did you express any opinion as to that?—I do not think I noticed that any suggestion of that sort had been made, but I do not see, at first sight, what difference it would make, if I were a ryot in the North-Western Provinces, and my land were being settled, what the gold price of the rupee might be. The gold price of the rupee does not regulate the price that I should get for my produce; that is regulated by other causes altogether. It would be nothing to me that the gold price of the rupee had changed; I should neither lose nor gain by it; the settlement would be made on the prices of the place—the prices in the neighbouring markets—which, as I have tried to explain to the Committee from my knowledge of India, follow very slowly, if, indeed, they follow at all, the variations in the gold price of silver. It would be a monstrous thing to say that, because the gold price of silver has altered, this would be any justification for raising rent. The native would not understand it, and I think it would be very unfair to him.

8552. Do you say that the Customs duties should be payable in gold?—Yes, I see no objection to that.

Rt. Hon. Earl of Northbrook, G.C.S.I.

4 Nov. 1898.

I would provide for a perfectly fair notice being given, and I should not extend it to small amounts.

8553. Are you aware at all what amounts are received?—I think it is now 3½ crores.

8554. I think you expressed the opinion that the stringency during the busy season results, to some extent, from the closing of the mints?—Yes, I think so.

8555. Formerly a merchant could buy silver, and could have it turned into rupees by sending the silver to the mint?—Yes.

8556. Now he can send gold from England and claim rupees for it?—Yes.

8557. But this he does not do, because he might lose more by the exchange than the interest he would get for his money in the meantime would amount to?—Exactly.

8558. But I do not understand you to say that the fluctuations of exchange are the direct result of closing the mints?—I meant, not the exchange, but the rate of discount.

8559. The rate of discount?—I say, in looking at the statistics before the Committee, you will find that in other years there has been very much the same fluctuation in the rate of discount.

8560. Then I think it was put to you that paying the larger notes in gold had the effect of contracting the currency?—It would have that effect, if you did it.

8561. But when you get your notes paid in gold, the gold would pass into the currency instead of rupees?—Yes.

8562. You would not at all contract the total currency; you would contract the rupee currency and add to the gold currency?—No; the gold would go, not into the currency, but into the hands of the person to whom you pay it.

8563. But exactly as he would use his rupees, so he would use the sovereign?—He would probably send it to England; but, still, you are right; it would be currency; it would be gold instead of silver currency.

8564. (*Sir John Muir.*) Before putting one question to Lord Northbrook, I would just like to express my very high opinion of the manner in which his Lordship has given his evidence—most fairly and justly. What I mean is, we have had witnesses who have held extreme views on the one side or the other, but I think Lord Northbrook has endeavoured to hold the balance very fairly. You have referred to the periods of stringency in India besides the extreme stringency that we had last season?—Yes, in the money market in Calcutta.

8565. I happen to have a very long connexion also with India—since 1849. Now I think the stringency of last year much exceeded, so far as my connexion with India has gone, anything that we ever had before. Are you aware that Parsees took Government paper to the banks in Bombay and asked for advances, and the banks refused to make the advances, although the rate was 12 or 13 per cent. Then the merchants said: "We must have the money "or we shall be compelled to suspend. We will give "you anything you like to ask up to 18 per cent."?—There was a very considerable stringency in the Bombay Money Market one year when I was in India—in 1874. The rate of discount went up very high; but I believe you are correct in saying that the last stringency lasted longer than on any previous occasion. I do not believe it went higher, but it lasted longer. I think the 18 per cent. must be a very exceptional case. I saw it stated, and I daresay it is correct.

8566. I know it was 18 per cent., because my partner was a director of the Bank of Bombay, and he knows that 18 per cent. was offered by the Parsees and was refused, because the banks had not the money?—It is very extraordinary, but, of course, that being so, it must have happened.

8567. Now, you are, of course, aware from your long experience of India that the native growers of wheat and rice and seeds, &c., are the large proportion of the population of India?—Yes, there is a large preponderance of the native population, no doubt, who are producers of agricultural products.

8568. In your opinion, is a low rate of exchange in favour of the people who are interested in the soil, the growers of wheat, seeds, &c.?—The fall in the gold price of silver, which amounts to the same thing as the fall of exchange, has, I think, to some extent—I do not say to the whole extent, as some think—but to some extent been to the advantage of the cultivators in India. I do not think the main reason of the great increase in exports was the fall of exchange; I think the growth of exports was mainly due to other causes, such as the railroads and the Suez Canal, and the fall of freight, and so on, but I think the fall of exchange had some effect. It has been a partial cause, I admit, and, as far as rupee prices have risen, the cultivators of India have profited; they would not get the whole, but they would get some of the profit.

8569. I was very pleased indeed to find that you so strongly emphasised your opinion, that the increase of the exports of India and the reduction of her imports, so as to turn the balance of trade as much as possible in favour of India, should be the object of everyone desirous of advancing the interests of India?—I did not advocate a reduction of imports.

8570. Some of us perhaps are a little more advanced than your Lordship. I think myself that that is desirable in the interests of India. Now, we had our Chairman giving 10*d.* as the intrinsic value of silver in the rupee to-day. 1*s.* 4*d.* is the rate that the Government of India fix; but that is a difference of 6*d.* in the rupee—an enormous difference. Now, a great many of the people of India have to compete with other countries, especially China. In China the rate of exchange is fixed pretty nearly on the intrinsic value of the metal in the coin, whatever it may be, whether a tael, or a rupee, or a dollar—whatever it is; it is about the intrinsic value of the silver that is in the coin. After having made allowance for the export duty in China, and the little difference in the cash money, is not there an advantage to the grower of tea and coffee in China as compared with India?—I should be very sorry to say exactly what his advantage is; other things being equal, the disadvantage would be much against the Indian grower of tea—I do not suppose any coffee is grown in China—but how far it is balanced by the export duty on tea in China and the rise of prices in copper cash there, I should be sorry to say. It appears to me it is to a certain extent, possibly to a considerable extent, balanced by that.

8571. Then we have referred to the growers of wheat, seeds, &c., and, of course, you know, the number of them are enormous in India?—No doubt.

8572. These are the men that operate on the soil—that produce the revenue—the income of India—and provide the material that is to be exported?—Yes.

8573. Then there is another large class, the merchants who buy the products. Do you not think that the interests of these two classes—the men who are interested in the soil of India and the merchants who buy the stuff that they produce—are of such importance that their views should have great weight in the consideration of this question?—I think they ought to have weight. In respect to the actual case you put to me, the interests of the cultivators of the soil in India would not be affected. I do not know that any cultivator of the soil in India grows tea. English capitalists grow the tea and they employ labour from central Bengal. They pay their labour partly in kind. I do not think there is any class of native cultivators who grow tea. They grow wheat and grain of all sorts, and in Eastern Bengal they grow jute, but I do not think they are subject to the disadvantage, whatever it may be, of Chinese competition. It affects only the tea trade; I do not think it affects India generally at all.

8574. Perhaps your Lordship is not aware of it, but, as a matter of fact, we have in Ceylon and also in Assam and in the Dooars a very small class of

natives who are growers of tea?—I was not aware of that.

8575. (*Sir David Barbour.*) I should like to clear up one point. Mr. Hambro asked you some questions with the object of showing that, if money was full legal tender, it could not go to a discount?—In its own country.

8576. In its own country. Now, if the Government of this country were to issue notes very largely, which were inconvertible, and made them full legal tender, they might, nevertheless, go to a discount?—With other countries.

8577. They might go to a discount with gold?—I do not understand inconvertible notes going to a discount with gold. Inconvertible notes are inconvertible notes.

8578. You might have an inconvertible note for 5*l.*, and you could not get five sovereigns for it. If there was an over-issue of the notes, they might go to a discount as compared with the standard gold coin?—An inconvertible note means a certain quantity of paper having a nominal value. At the time of the French Revolution the assignats became so depreciated that finally they were worth little more than the paper they were printed on. Their value depends on the proportion between the amount in circulation and commodities.

8579. If only a small amount of inconvertible notes were issued in this country, they would not go to a discount?—I do not know what the effect would be of attempting to issue inconvertible notes in this country. *Rt. Hon. Earl of Northbrook. G.C.S.I.* 4 Nov. 1898.

8580. Inconvertible notes have been issued in this country in former times, and they have gone to a discount as compared with gold?—Yes.

8581. Now, as regards the land settlements. When an officer is making a re-settlement, he takes into account the prices of produce and rents?—Yes.

8582. And, if the value of the rupee is altered so as to affect rents and the prices of produce, that alteration is taken into account in making the re-settlement?—Certainly. It would follow from the use of the word "price" that that would be, of course, considered. If anything had an effect on prices, that would be considered.

8583. So that, in so far as it is just and equitable to take into account the altered value of the rupee, that is already done in making re-settlements?—It certainly would be done. At the same time, the point I wished to make was this: I do not think that prices up-country have been affected by the closing of the mints.

8584. The argument was that the alteration in the value of the rupee should be taken into account in making settlements, and I only wish to bring out that, so far as it is equitable to do so, that is actually done under the present system?—It must be so, from the terms of the proposition; the value of the rupee and prices are the same thing.

The witness withdrew.

MR. WILLIAM JAMES THOMPSON, senior, and MR. WILLIAM JAMES THOMPSON, junior, called and examined. *Mr. W. J. Thompson, sr., and Mr. W. J. Thompson, jr.*

8585. *Chairman* (*to Mr. Thompson, senior.*) You and your son are the members of a well-known Mincing Lane firm?—Yes.

8586. You have been a tea broker in Mincing Lane for how many years?—Sixty-seven years.

8587. For many years you have been Chairman of the National Discount Company?—Yes.

8588. (*To Mr. Thompson, junior*). You have been in partnership with your father for the last thirty years?—Yes.

8589. And you are both very familiar with all questions affecting the tea industry?—We ought to be.

8590. What has been your connexion with the tea industry?—As brokers—simply to take the tea entrusted to us for sale in the London market, and to do the best for our merchants.

8591. Can you give us the statistics of the approximate average prices of teas in London since 1884?—Yes. I have prepared the following table:—

APPROXIMATE AVERAGE PRICES OF TEAS IN LONDON.

Season.	Indian.	Ceylon.	China.
	s. d.	*s. d.*	*d.*
1883–4	1 1½	1 3½	11
1884–5	1 1	1 3	11
1885–6	1 1½	1 3	10½
1886–7	1 0	1 1	10
1887–8	0 11½	1 0½	9½
1888–9	0 10¼	0 11	9
1890–90	0 10½	0 11	9
1890–1	0 11	0 11	9½
1891–2	0 10	0 9½	9
1892–3	0 11	0 9	8½
1893–4	0 9½	0 8½	8
1894–5	0 10¼	0 8½	7¾
1895–6	0 9¼	0 8	7½
1896–7	0 9½	0 7¾	7
1897–8	0 9	0 7½	6

8592. During all those years, from 1883–84 to this time, China tea has always been the cheapest?—Oh, yes, in price.

8593. Have the imports into this country from India and Ceylon and from China been proceeding upon a regular ratio, or has there been a great increase in the one and a decrease in the other?—There has been an increase in the one and a decrease in the other.

8594. An increase from India and Ceylon and a decrease from China?—Yes.

8595. How do you explain that the cheapest article should have been the one that has decreased in quantity?—Because India and Ceylon offer you so very much better tea of the same kind than China.

8596. Therefore, you had a better market, although at a higher price?—But, really, India and Ceylon teas are cheaper than China teas because they go farther. You, yourself, well know that you do not require to put so much tea into your pot.

8597. Do you think the general body of people who are the consumers of tea take that into account?—Well, I do not know—perhaps they make it too strong.

8598. Can you tell us what the circumstances are that have caused this change of price?—Supply and demand, in which I agree with the evidence already given by Sir James Mackay and others.

8599. The supply has exceeded the demand?—It has in one sense, because we used in former years to have a bigger stock; it used to be necessary to keep a bigger stock, because the China teas arrive here only during a few months of the year, whereas now every week a large Ceylon sale is held, and for nine months in the year there are Indian sales, so that we never have a shortage of supply. Buyers prefer now going from hand to mouth, and if the Indian and Ceylon supply is short, they prefer being squeezed rather than have to keep large stocks. And we must remember that tea does not keep. You cannot keep your tea for a year or even for six months; it is not as good as it was when it first came in—therefore, it is desirable for that and for many other reasons to keep on selling your tea as it arrives. That is the practice of the London market.

8600. Can you give us an opinion as to the markets for tea other than the English market?—As to the other markets for tea, one is India itself, but that is merely a nominal market, because the Indian native does not drink tea in the same way as the Chinaman does.

8601. But the India native surely prefers Indian tea?—Such tea as he drinks, yes.

Mr. W. J. Thompson, sr., and Mr. W. J. Thompson, jr.

4 Nov. 1898.

8602. India does not import any tea from China ?—Practicly, no.

(*Sir D. Barbour*). They do import a little.

(*The Witness*). There is a little imported en route for Persia and Central Asia, but it is an exceedingly small quantity. Then, if you take Australasia, there you may say that British grown tea has practically conquered the market. There has been a very rapid development on the lines of the home trade; it is now about 20 millions a year.

8603. (*Chairman.*) Perhaps you will put those figures in ?—Yes, I will include the figures. Then we come to the United States and Canada; our trade there is gradually increasing, but very slowly indeed—it may now be some 12 millions a year.

8604. Do you say that Indian tea is increasing in that market ?—Only slowly—very slowly. I am sorry to say that China and Japan have practically the whole of the United States consumption. It is a totally different tea to the Indian or Ceylon tea. Instead of black tea it is green, or "uncoloured", and of a peculiar flavour. Perhaps it is a matter of taste, perhaps it is a matter of their water, but anyhow the Americans prefer the China and Japan tea. I may say that the London dealers who do business in the country districts in England, such as Liverpool, Birmingham, and so on, have casks of water from the different towns sent to them to their London offices, in order to taste the tea made in that water in order to select the samples best suited to the district. It is only fair to say that the Indian and Ceylon planters have done their very best to push the tea in the American and Canadian markets, by putting a voluntary cess upon themselves amounting to many thousands a year, and by advertisements, and even by giving away their tea and sending special agents over to sell it; and, besides that, the London dealers doing the export trade have done the same thing. Yet they have not succeeded in getting hold of the American market, they have not laid hold of the American taste.

8605. Is that true of all the States ?—The whole of America generally. I will give you here the figures that I got from the United States Consulate, on purpose for this Committee, of the teas imported into the United States of America, taking it for 1897 as being the last year. There were 56 million lbs. from China, 45½ million lbs. from Japan, and only 2 million lbs. from British India; that is to say, imported direct. A little more goes from us.

8606. Is there any duty in America upon tea ?—Yes.

8607. It is the same duty for all tea ?—No; there is an extra duty of 10 per cent., if it is an indirect import, otherwise there is no difference; all the tea duties are absolute.

8608. (*Sir J. Muir*). There was an extra 10 per cent. put on for the War ?—I think so. Then there is another market—continental Europe, principally Russia. In that market they consume the same class of tea from China as we get from India and Ceylon, namely, black teas, and, therefore, we are on a better footing there, and the trade with Russia is increasing, I am glad to say, very considerably. This year, again, it is larger than last year.

8609. (*Chairman.*) Is that in India and Ceylon teas ?—Yes, both. I mean the trade from the London market. I should say that the Russians are an exceedingly conservative people. At one time, even the fact that the Indian tea was done up in different packages from those that they had been used to from China militated against it; but now they have found out that really our teas are worth their attention, and we get large orders from Russia for Indian and Ceylon teas of all growths.

8610. In this country Indian and Ceylon teas, of course, have a good market ?—Yes, and our home consumption is increasing every year; it is increasing, you may say, *pari passu* with the population.

8611. Do you think that in recent years there has been an excess of production in India or Ceylon ?—There has been quite enough; 5 per cent. less would have given you 10 per cent. more for your teas.

8612. Do you think the lowering of the price has rather arisen from an excess of supply ?—We have had rather too much, and we also find that we can do with less stocks than we used to, which is a very important factor.

8613. Do you think the supply of Indian and Ceylon teas will increase or not ?—I think so, undoubtedly, but it will not increase so rapidly as hitherto.

8614. How is it affected by the present rate of exchange?—Is that a fair question to put to a Mincing Lane broker ?

8615. I will not ask you if you have not an opinion to express upon it ?—I have an opinion, of course. It is affected. I am quite sure that, since the exchange has risen, many people have not been extending as they would have done.

8616. Then it is to that extent injurious to the trade ?—It has affected it in that way, there is no doubt.

8617. According to your figures it does not seem to have affected prices, but it would have raised the cost of production ?—Yes.

8618. And, therefore, affected the profit and affected the growth of the trade, and possibly the investment of capital in that trade ?—It has affected profit certainly, as we poor shareholders have found out.

8619. (*To Mr. Thompson, senior.*) You agree with your son's evidence ?—Yes.

8620. (*Lord Balfour of Burleigh, to Mr. Thompson, junior.*) I gather from you that the variation of these figures arises, in your opinion, from a change in taste of those who drink tea; they now prefer the Indian and Ceylon tea to the Chinese tea ?—Certainly, and the Chinese have helped that by the quality of their teas deteriorating.

8621. I suppose you say that the relative price of the two teas would be an important factor in determining the consumption. For example, if China tea can be put on the market at a less relative price than Indian tea, it would in the course of time let in the Chinese to compete again ?—It would interfere certainly if they could undersell Indian and Ceylon teas, but it is fair to say that some of our biggest people in London will not use a pound of China tea because it spoils their blend. You know that practically all the tea that is sold in the United Kingdom is blended.

8622. Have you any opinion whether the difference in quality between the India and Ceylon tea and the China tea is intrinsic, or is on account of careless cultivation, or anything which the Chinese by improved methods could counteract ?—It is certainly partially intrinsic, because the Indian and Ceylon tea is not the same as the China tea, it is an indigenous plant, growing wild in the jungles of Assam, and it is found to be superior to the China plant. We have certainly heard that a lot of new tea machinery has been sent to China, but so far we have had no results from that. Anyhow, they will never get from the Chinese plant such fine teas as are got from the Indian plant.

8623. Are you able to say whether any experiments have been made in China with the Indian plant ?—I think not: they have made experiments in Java, and the result has been good.

8624. (*Sir J. Muir.*) You have some interest in tea companies as a shareholder ?—Yes, a little.

8625. And you are aware that the dividends paid by the tea companies this season have been materially less than they were last year and in previous years ?—Yes.

8626. Arising mainly from what cause ?—Increased cost of production.

8627. One of the leading elements in that is the difference in exchange; that is to say, suppose your agents in Calcutta sell a 90 days' sight bill upon a London bank to lay down funds to pay the coolies' wages, if they sell the bill at 1*s.* 4*d.* in the one case, whereas if the Government of India had not in this arbitrary way fixed the rate at 1*s.* 4*d.*, they could have

sold the bud at 1*s.* 2*d.*, that would have made a considerable difference?—Yes.

8628. And probably have turned the loss on the last season into a profit?—It would have made a considerable difference, of course.

8629. What difference do you estimate there would be between a 1*s.* 4*d.* rate and a 1*s.* 2*d.* rate, on the wages of the coolies per pound of tea?—I believe it would amount to about $\frac{5}{8}$ths of a penny per pound.

8630. That effect is felt very much more severely, is it not, in Ceylon than in India, because the entire industry of the Island of Ceylon now, since the coffee failed, is tea?—Yes, that is the great industry of the island.

8631. The great industry of the island hangs now upon tea?—Yes.

8632. Suppose the tea industry should fail, as coffee has failed, what becomes of the island?—I will leave you to deal with that question, I do not like to think of it.

8633. How is the Government to carry on the administration of the Colony?—I am not the Governor.

8634. These are questions, I think, that it behoves us a little to look at. I hear the Ceylon tea planters putting questions of that nature, and I daresay you have heard the same?—Yes, but is it not a little hard to put the question to a poor tea broker?

8635. You are a tea planter to a small extent, but you are not in the same position as some of the poor tea planters are?—No, and I never was in that position from the other point of view either.

8636. (*Sir F. Mowatt.*) In the yearly prices which you gave us of the teas, I observe some curious variations. In 1892–93 I think you said that India was selling at 11*d.*, Ceylon at 9*d.*, and China at 8$\frac{1}{2}$*d.*?—Yes.

8637. The next year it fell to 9$\frac{1}{2}$*d.* in India, 8$\frac{1}{2}$*d.* in Ceylon, and 8*d.* in China?—Yes.

8638. The next year it rose again to 10$\frac{1}{4}$*d.*, 8$\frac{1}{2}$*d.*, and there was a little fall in the case of China to 7$\frac{3}{4}$*d.*?—Yes.

8639. Is there any explanation of that beyond the ordinary rates of supply and demand?—Probably not. We had one very fine year from Assam—a sort of climatic influence came over Assam, and gave us a very large quantity of high priced teas. I think that was the year when the price rose to 10$\frac{1}{4}$*d.*

8640. On the whole, from your experience of the trade, do you anticipate that the supply of Indian and Ceylon teas will tend to increase?—Yes, I am certainly of that opinion.

8641. (*Sir D. Barbour.*) In the figures you gave of the prices, I noticed that, in the earlier years, Ceylon tea fetched a much higher price than Indian, and now it is lower. What is the explanation of that?—In the earlier years there was only a small quantity, and it was of finer quality than now—at first, too, it was a novelty.

8642. I think you said that there had been some over-production in recent years?—Well, there has been quite enough.

8643. You suggested that if there had been 5 per cent. less tea, the price would have been 10 per cent. higher?—Yes.

8644. So that the tea planters would have gained?—They would in that way; but it is impossible to stop production.

8645. But you suggest those figures—5 per cent. less tea would mean 10 per cent more in price?—Yes, our stock is so small, that a reduction of 12 millions in it would cause an advance in price. That is what it would amount to.

8646. You also said that the rise of exchange would diminish the profits?—That is a *sequitur*, I think.

8647. And that would diminish, to some extent, the rate of production?—I think it would eventually have that effect. It has with some people, I know.

8648. According to your figures, if a rise in the rate of exchange caused a 5 per cent. reduction of production, there ought to be some gain to the planters from a rise in the London price?—That is so, taking these figures; but tea, as you know, takes five or six years before it is in full bearing. That is why you cannot stop production.

8649. But the argument would be this: that a fall of exchange might so increase production as to lead to over-production, and be followed afterwards by a reaction?—Quite possibly.

8650. Whereas, if there was a steady exchange, you would, at any rate, get rid of one cause of fluctuation and uncertainty?—Yes.

8651. You said that the tea plant in India and Ceylon is altogether different from the tea plant in China?—Yes.

8652. And gave a better tea?—Yes.

8653. That also gives an advantage to the Indian and Ceylon planters?—Yes, but the first gardens in India were laid out with the China plant, and now nobody would dream of sowing the China plant.

8654. We know that China is an old country, and tea has been grown on the same land there for a large number of years, so that it is possible that the soil may become exhausted; whereas in Assam and the Dooars, you have virgin soil. That would make a difference, would it not?—I do not think so, because the original gardens where the China seed was planted were also on virgin soil.

8655. I do not say what the difference would amount to, but there would be that additional difference?—Of course, it is a newer soil undoubtedly.

8656. And, therefore, a better soil?—There is no doubt.

8657. (*Sir A. Dent.*) Are the prices you gave of the different teas just now the prices in the United Kingdom?—In the London market, yes.

8658. Then you are not including the large quantities of high class teas that go straight from China to Russia?—No, this is only from the London market.

8659. If you included them in your figures, that would make the average for China very much higher?—Very much higher, because they take the bulk of the finer teas, and have done for many years, direct.

8660. You say the stock of tea in London now is very much less than it is used to be?—Yes.

8661. I suppose it is brought about very largely, if not entirely, by the fact of the Indian and Ceylon tea coming in week by week?—Yes.

8662. That, therefore, is a point in favour of Indian and Ceylon teas?—Well, I think, that is only a point in favour of the market remaining steady.

8663. I mean, people will not import China tea because they would have to hold it for such a long period before selling it?—That would be purely from a merchant's point of view, depending on the offers made for the tea from time to time.

8664. Of course, it would affect the merchant very much in considering the quantity of tea he should lay in stock?—Yes.

8665. Therefore, he will prefer to deal in Indian and Ceylon teas?—Yes.

8666. Can you form an opinion as to the possibility of large extensions in the tea-growing area in Ceylon? Though you say you are only a broker, we know how you watch tea growing all over the world. It is the common belief, I think, in Ceylon that there is very little more land available there?—That is what I am told.

8667. You have personal experience of India. Are there large districts in India still available, in your opinion, for tea planting?—I think a very great deal.

8668. I think you said, in answer to Sir John Muir, that the dividends of the tea companies were very largely affected by the extra cost of production?—That is my experience as a shareholder.

8669. I think you might have added that the price here has gone down also?—Not very much.

8670. It is not solely the cost of production?—The price has fallen very little in the last two or three years—the average price. Individual prices may have

Mr. W. J. Thompson, sr., and Mr. W. J. Thompson, jr.

4 Nov. 1898.

fallen, but the average price has not changed much; it is 9½*d.*, 9*d.*, 8*d.*, 8½*d.*, and so on.

8671. Do you think the Ceylon and Indian tea growers have much to fear from the possibility of China tea being again imported in large quantities into this market?—I hope not.

8672. You hope not, but will you go beyond that?—I have never understood why China has not sent us more tea, considering the difference in exchange. I could never understand it; I sincerely hope they will not send us any more; but it is a possibility.

8673. (*Mr. Le Marchant.*) What has been the rate of increase in the production of Indian and Ceylon tea in the last three years?—I can give you the exact figures for the last three years. The imports of Indian tea in 1895–96 were 118 millions; in 1896–97, 131½ millions; in 1897–98, 135½ millions; Ceylon tea in 1895–96, 82 millions; in 1896–97, 92 millions; and in 1897–98, 93 millions.

8674. There would be some fall in price corresponding to the increase from 118 to 135½ millions, would there not?—Yes, and there is a slight fall in price—not much. Then you have to take the fact that we receive at the same time 10 millions less China tea between the two years; we should have less China tea, and more Indian and Ceylon tea.

8675. On the other hand, India and Ceylon would go further in use?—They ought to do. Obviously, we do not want them to do. They do as a matter of fact go further, because they make so much stronger a tea.

8676. Would you attribute that increase of production to the favourable rate of profit that was existing previously?—There were signs, many years ago, that Indian and Ceylon tea would be the favourite. A garden takes five years before it begins to bear properly.

8677. Would the increase of the output be likely to follow any advantage in the way of cheapened production; would the tendency be for the supply to grow up to the limit of profit?—I suppose that is so in the case of every article. It does not matter what the article is, it would be governed by the same law.

8678. So that any special advantage in the way of a low exchange would tend to be counteracted, so far as profit goes, by the increase in production?—In the course of time, in tea, perhaps so. I should like to put in some figures that we are publishing in our circular to-day as regards the external markets.

(*Chairman.*) Any tables you like to add to your evidence we will put in the Appendix.

The Witness withdrew.

Adjourned.

TWENTIETH DAY.

Tuesday, November 15th, 1898.

PRESENT:

SIR FRANCIS MOWATT, K.C.B. (in the Chair).

SIR JOHN MUIR, Bart.
SIR CHARLES CROSTHWAITE, K.C.S.I.
SIR ALFRED DENT, K.C.M.G.
MR. ROBERT CAMPBELL.
MR. F. C. LE MARCHANT.

MR. ROBERT CHALMERS, *Secretary.*

Mr. W. H. Cheetham.

15 Nov. 1898.

Mr. W. H. CHEETHAM called and examined.

8679. (*Sir F. Mowatt.*) Will you state your position?—I am a member of the firm of Kilburn & Co., of Calcutta. We are interested, either directly or through our companies, in indigo factories, tea gardens, a shellac factory, cotton spinning mills, inland navigation, a branch railway, electric lighting and power, machinery, and other property.

8680. Do you attend here to-day to give evidence on your own account or as representing your firm?—Merely on my own account.

8681. You were connected with the firm, no doubt, in 1893, when the Indian Mints were closed to silver?—Yes.

8682. Were you at that time of opinion that that was a necessary action to take?—No, I was very strongly opposed to it.

8683. Will you state generally the grounds upon which you were at that time opposed to the closing of the mints?—The majority of the merchants of Calcutta addressed a protest against the closing of the mints, which will be found on page 198 of the Herschell Committee's Minutes. I will read this extract from that protest: "Our opinion, "which we submit with all due deference, is that the "measures being urged upon the Government of "India by the Currency Association for steadying "and raising the rupee are uncertain, unsound, and "mischievous, fraught with danger to the financial "credit of the Government and to the commercial "prosperity and development of the country. We "do not favour a fluctuating or depreciating rupee, "but we are more averse to a fictitious artificial "sterling value being placed upon the rupee, and we "believe that any proposals yet submitted by the "Currency Association would have much worse "effects than those of the state of things which "these proposals are intended to remedy. As prac-"tical, experienced business men, we do not hold "with the assertion of the President of the Currency "Association, that the fall in silver has restricted "and embarrassed the trade of the country to such "an extent as to create an almost unparalleled state "of depression. We believe that the causes of the "depression, such as it is, are to be found elsewhere. "On the other hand, we desire to make known that "we are not insensible to the embarrassment of the "Government as regards the present state of its "finances, or wanting in sympathy for the employees "of the Government who have suffered by the recent "fall in exchange; but we submit that in order to

" make these matters right, it does not appear to us " to be necessary or desirable for the Government to " resort to the desperate expedient of tampering with " the monetary basis upon which the financial and " commercial system of the country is founded, and " under which the country has hitherto been most " prosperous."

8684. You still retain that opinion I understand?—Most decidedly.

8685. Would you say that the mints should now be re-opened?—I am of that opinion.

8686. Immediately or gradually?—If any expedient such as has been described in the evidence already given could be devised to break the great shock which would undoubtedly come from the re-opening of the mints, I think it ought to be tried; but I believe the market would take command very soon, and that the currency would get on to its old basis almost immediately; that is to say, the rupee would assimilate to the value of silver.

8687. That would now be about 10*d.*?—I think it is 10½*d.*

8688. But you would contemplate the rupee being about that rate?—No; on the contrary, I think the effect of re-opening the mints would be to cause a rise in silver, and that we should have something between the present rate of exchange and the present price of silver.

8689. Something between?—Yes.

8690. Would you contemplate any considerable rise in the value of the silver?—Yes.

8691. Have you thought at all to what you would contemplate its going?—I have. Of course, it is very much guesswork, but I think that silver would rise to between 33*d.* and 34*d.* probably.

8692. That would mean a rupee of what?—I think it is about 12½*d.*

8693. In proposing that, you have in your mind the effect of the position of the Government as having to pay large sums in gold in England?—Certainly.

8694. Have you contemplated how the difficulty of the Government would be met, or should be met, in that case; perhaps I had better take it from the point of taxation; would you contemplate the Government imposing additional taxation?—It might be necessary temporarily.

8695. You do not think it would be permanent?—I do not.

8696. Let me put it in this form: if the rupee were to fall from its present price, say 1*s.* 4*d.*, to 1*s.* 0½*d.*, that would represent a difference in annual payments of between 10 and 12 crores; we should be, at all events for the moment, face to face with the necessity of raising say, to be moderate, 10 crores of rupees?—Yes.

8697. You say it might be temporarily necessary, but in the meantime they must either borrow, or they must raise additional taxation to pay their debts?—They might borrow. I think it would be better to borrow in order to get back to a silver standard than to borrow in pursuit of a gold standard.

8698. What would they have to borrow to pay an additional 10 crores of rupees?—About 6,000,000*l.* sterling. There would be certain immediate compensations, so that the full amount would not be required. For instance, in the opium revenue there would be an immediate compensation.

8699. The opium revenue is rather dwindling, is it not?—It is dwindling, but the return to the silver standard would arrest its decay.

8700. How do you explain that?—Because the Chinese now have to pay such a very high price in dollars, in order to give us the price we want in rupees.

8701. And the lower the rupee, the more China would be able to take, and the price would go up?—China would be able to take more, and the price need not go up in China, but we should get more rupees.

8702. What you have said points to your believing that the price of silver would, at all events, not fall?—If the mints were re-opened do you mean?

8703. The general price of silver?—Quite so.

8704. But how if the decline in the price of silver continues?—I do not think we need fear much, if any, decline in the price of silver. The proportion of silver being produced to gold is falling very fast indeed.

8705. But do you ever recollect a time, since silver began to fall, when we did not think or hope that we had got to the bottom?—Oh yes.

8706. You do?—Yes.

8707. Now do you think that the effect of the opening of the mints would be to steady exchange?—No, I am not prepared to say that. I think there would be fluctuations.

8708. Do you think it would contribute in any way?—It would in the long run. It would not at the outset.

8709. Perhaps you had better state how you arrive at that conclusion?—It would then be on a natural basis. It would be dependent on the price of silver. Many of the most important silver mines are producing less silver than they did.

8710. Let us assume that the mints are now opened to the free coinage of silver; will you state what advantages you consider would result from that to Indian trade?—The most important advantage would be that we should have an easier money market.

8711. "Easier money market," meaning for the moment a larger currency?—I mean we should be able to borrow money on easier terms. The present rate of discount is only 5 per cent. in Calcutta—the Bank rate—but the money market is very tight.

8712. And to what cause do you attribute that?—I attribute it to the closing of the mints.

8713. How do you establish the connexion between the two?—The closing of the mints has reduced the volume of the currency in relation to trade. Population is always increasing, and trade is expanding; if you do not continually add to the currency, you actually in fact reduce it; that is to say, it is reduced in relation to requirements, and we have not got enough currency.

8714. That is what I put to you. You really say it is the insufficiency of currency?—It is the insufficiency of currency.

8715. Now a person taking gold to India can command silver currency, can he not?—At a definite rate.

8716. That is to say, a man taking 1,000*l.* in gold can command 15,000 rupees?—Yes.

8717. Therefore at that price he can command currency?—At that price he can.

8718. Have you considered how far the present silver currency requires increasing? Have you any definite views upon that, or would you merely say that anybody who wished to bring silver in should be enabled to get it coined and get it turned into currency?—I think no man can say how much currency is required. It is a thing that must be settled automatically. If the mints are opened, anybody who wants silver changed into rupees can get it done.

8719. Do you distinguish generally between "currency" and "loanable capital?"—No. I think the relation is probably best illustrated by the relation between bread and toast. You can have bread without toast, but you cannot have toast without bread. If I go to a bank I do not ask for "loanable capital." I say, "Will you lend me so many rupees? " I want so many rupees to pay my wages or to buy " my cotton or indigo." The phrase "loanable capital" never comes into the conversation between me and my banker. What I want is rupees.

8720. Now, as regards the recent stringency in India. Do you consider that it extended to India generally, or only to persons engaged in the external trade?—It certainly extended into districts with which

Mr. W. H. Cheetham.

15 Nov. 1898.

we have connexions in Behar; it extended into districts where we buy cotton—in Central India.

8721. To the same extent?—In Behar, yes.

8722. What rates were payable during the tight season there?—Well you see that, when a Bank rate jumps up to 12 or 13 per cent., it is indicative of very great stringency, no doubt, but it does not indicate the exact amount of the stringency, because, when money gets to 12 per cent., most people cannot get it on any terms.

8723. Except on the terms of importing gold?—But the people have not got the gold to import.

8724. That is why I asked you whether you considered that "loanable capital" and "currency" were identical. A man might have no rupees, but if he had ample loanable capital he could first of all get sovereigns, and with sovereigns he could get rupees?—May I ask what you mean by "loanable capital?"

8725. I was taking it from you as "currency" for the moment?—If we have currency, we have got the rupees, and do not want to borrow.

8726. But if you have gold, you have the power of getting rupees?—But we have not gold. We have all these things—indigo factories, cotton mills, machinery, and almost every kind of property you can think of, but we have not got the currency; we have not got the gold.

8727. Do you anticipate that the stringency of last year will be repeated?—We have the stringency now. If I go to a banker and say that I want an outlay for an indigo factory, if he will give me the advance at all, which is doubtful—although I would not undertake any indigo factory which was not perfectly sound—the banker would say "I must have 9 per cent." In Bombay the best cotton mills have had to pay more. A dozen mills have arranged to buy cotton, say, at 9 or 10 per cent., and mills which were not of the first class have had to pay much more. I should like to explain why a cotton mill requires so much capital. The Indian cotton mills are dependent on the Indian cotton crop for their raw material. That crop goes to the market in two or three months. If the Indian mills do not lay in a stock during those two or three months, the chances are that the cotton is exported, and then they are put into a hole during the rest of the season. Therefore we buy, perhaps, 10 or 12 lakhs' worth of cotton in February, March, and April. We borrow the money to pay for that cotton from the banks. We used to get that at 4 per cent. If we go to a bank now, if it is in Bombay, we should have to pay 10 per cent. In Calcutta we generally arrange to pay, say, 1 per cent. over Bank rate, with a minimum of 4 per cent.; but, if we go to a bank to-day, I do not think any bank would let us have money on those terms.

8728. That is not because of the want of security, but because it has not got the money?—It has not got the money.

8729. Did that stringency ever arise before the mints were closed?—I remember various commercial crises, not only in India but in England.

8730. I see that in 1884 the Bank rate touched, in March and April, 12 per cent., in 1876, 11 per cent.; and that is the nominal rate, as 5 per cent. is now. The additional charge which the bank make upon you above that, I presume they made upon you then as they do now, so that really if 5 per cent. now represents 10 per cent., this 12 per cent. represents nearly 20 per cent.?—I say that the rate does not rise above 12 per cent. 12 per cent. seems to be the limit for the rate, or very nearly, just as 10 per cent. is the limit for the Bank of England rate. I have not known the Bank of England rate above 10 per cent. But what I want to point out is this, that in 1877, when the average Bank rate was 8 per cent. and some decimal, a compensatory action was immediately set up. The consequence was that over 14 crores of silver came out in 1878, and away went the Bank rate down to an average of 5 per cent.

8731. When you say an average, you mean through the year?—Yes. May I just offer you this diagram to show how the average Bank rate compares with the import of silver. The red line there is silver, the black line is the average Bank rate for the year.

[*For this diagram, see Appendix.*]

8732. If you take 1889 and 1890, the Bank rate rose to 12 per cent. In 1884 it rose to 11 per cent. In 1882 it rose to 10 per cent. In 1894 it rose to 10 per cent. In 1897 it rose to 10 per cent. In 1898 it rose to 12 per cent. Now, to go for a moment to the prices. What would you say had been the course of prices of food grains since 1885, when the heavy fall set in?—The price of rice in Bengal has risen considerably.

8733. Looking at Mr. O'Conor's Table in the Appendix, and taking the years 1886 to 1898, you see that the rise in rice is from 135 in 1886 to 167 in 1898. The rise in wheat is from 117 in 1886 to 147 in 1898. Then there are a series of Indian grains, of which the prices are given in the same way; they have risen from 122 to 139, from 122 to 134, from 103 to 173, and so on, and, taking the total averages, the prices have risen from 957 in 1891 to 1,000 in 1898. Now, what state of prices supports the contention that a falling exchange as opposed to a steady exchange stimulates exports?—I do not consider that a falling exchange in itself necessarily does stimulate exports.

8734. You do not think it does?—Not necessarily. A falling exchange between two gold countries merely indicates an adverse balance of trade on the part of one of them, which is adjusted by a transfer of bullion in the last resort; but a falling exchange, with open mints, between India and gold countries is not a mere balance of trade; it corresponds with a change between silver and gold. We get in India through such a falling exchange more silver for our produce, which stimulates production, which gives a material benefit to the producer in India, and, more than that—more than the actual result, which he perhaps is unable to trace—it has a very great moral influence. If he sees that he is getting three rupees where he was only getting two rupees, although he might have to pay something more, he thinks he is better off, and that undoubtedly stimulates production.

8735. You do not think that he carries the mental process a little further, and says to himself, "Although "I am getting three rupees where I used to get two, "I do not get more for the three than I used to get "for the two"?—He does get more, because he does not pay the same in proportion; but the moral effect is even greater than the actual effect.

8736. Do you think there is any limit to the fall in the value of silver which would be beneficial to him?—I think we cannot anticipate any great fall in silver, if any.

8737. But there is no point at which you would draw the line, and say the further fall in silver would not be for the advantage of the producer in India, either moral or practical?—No, there is no point that I would fix. I do not think anybody could fix such a point, but silver is a precious metal; silver is very different from inconvertible paper currency.

8738. Now to go for a minute to China. Do you support the view that a fall of the dollar exchange is acting as a bounty on cotton spinning in China?—Yes.

8739. As a matter of fact are the China mills prosperous just now?—The China mills are in an incipient stage. Those which are managed by Chinese have been comparative failures; those which are being managed now by Europeans are, I believe, doing very well, but I have not any figures.

8740. Has that at all affected the output of Indian cotton mills?—That could not affect the output.

8741. In point of fact, are the exports of yarn from India increasing or decreasing?—Mr. O'Conor, I think, said that the export of yarn had not decreased, but I cannot follow his figures.

8742. Of cotton yarns in the year 1885 the export was 78,000,000 lbs., and it has risen to 199,000,000 lbs. Taking the last few years, it rose from 134,000,000 lbs. in 1893–94 to 158,000,000 lbs. in 1894–95; in

1895–6 to 184,000,000 lbs.; in 1896–7 to 195,000,000 lbs.; and in 1897–8 to 199,000,000 lbs. That is a very rapid increase, apparently?—I must say that I do not understand those figures. The "Bombay Gazette" of the 9th August said that during 1897 we sent 23 per cent. less yarn, and 64 per cent. less piece goods, to the Far East than in 1896. From Bombay in 1896 473,000 bales were sent, and in 1897 362,000 bales. That was partially made up for by increased shipments from Calcutta, which benefited by the plague in Bombay. Calcutta sent 30,000 bales in 1896 and 62,000 bales in 1897, the two together making 503,000 bales in 1896 and 424,000 bales in 1897. My figures do not include Madras, but I have reason to suppose that Madras is a very small quantity. They have, I think, only five mills there.

8743. Is the explanation to be found in the words "to the Far East" that you used there? Is there any other export, except to the Far East, of cotton yarn which would not be included in those figures?—There is a small export to Singapore and Batavia, but it is unimportant. There may be this explanation, that Mr. O'Conor's figures are for the financial year, and mine are for the 12 months ending 31st December.

8744. Have you the same thing for any of the previous years?—Yes, I have all the figures here. I have also the yarn report from Hong Kong, which corresponds very closely with my figures. The total imports from India into China and Japan of cotton yarn in 1896 were 500,000 bales (my figures were 503,000 bales), and in 1897, 447,000 bales (my figures were 424,000 bales, but I omitted Japan, and I have not got the Madras exports).

8745. Are there any other commodities in which India competes with China?—Do you mean of shipments from India to China?

8746. Yes?—There is opium. China is growing opium to an extent which did not prevail formerly.

8747. India competes with China in tea. As to that we have had a great deal of evidence, and I do not think we need take you through it, as there is no question, I imagine, that the Chinese tea trade is not at present holding its own against the Indian trade, and has not for many years?—No. I think one reason for that has not been mentioned, at least I have not noticed it in the evidence. Something was said, I think, in Mr. Cameron's evidence about the internal taxes on tea: I think he made out that that amounted to about 14 per cent. That would seem to be regarded as a kind of set-off against the disadvantage of our exchange. I do not think that should be taken as a set-off in any way. It was the very fact that these internal dues existed which gave such an impetus to the development of the tea trade in India. It is not a new thing—not something that has cropped up since exchange has turned so much against us.

8748. Still it does act as a weight upon the Chinese tea dealer?—But, because the inefficient Government of China allows this restriction of trade, that is no reason why we should impose a relatively larger restriction on trade to give them back this disadvantage and something more.

8749. I do not think that was contended. The fact was put forward to show that, taking it all in all, the tea trade in China was not, on the present constitution of China, likely to affect the Indian tea trade. I do not think it was contended, at all events I did not so understand it, that it was supposed to be an exact equivalent for India's alleged disadvantage in exchange?—I do not think it should be looked at as a set-off in any respect. It seems to me that that is very much as if in the next war with China, because the Chinese were armed with bows and arrows, we should throw away our Maxims.

8750. Do you know, as a fact, that the wages paid to the labouring classes in China are not paid in silver at all, they are paid in copper "cash"?—I believe so.

8751. And that copper cash does not vary with the value of the dollar?—No, it does not vary with the value of the dollar. At the present time copper is relatively higher than it was.

8752. (*Mr. Campbell.*) I think Mr. Cameron's evidence was to the effect that the copper cash had increased in value, as compared with silver, by about 14 or 15 per cent.?—Yes.

8753. (*Sir F. Mowatt.*) That 15 per cent. which you quoted was not on the question of commodities, but on the question of the cash?—I think Mr. Cameron put the two together, and made it 36 per cent., and said we were only at a disadvantage of 6 per cent., taking the exchange disadvantage at 36 per cent. I think that is what he said.

8754. As bearing upon the China trade, have you any facts within your own knowledge as to whether the wages and general prices in China are stationary or rising?—I have none within my own knowledge; I have seen the report from our consul at Shanghai, but I cannot say anything about the interior. I think wages have not increased, or very slightly.

The Secretary read the following extract from Sir Claude Macdonald's Consular Report for the year 1896 *on the Trade of China.*

"The price of labour and of raw produce alike must ultimately be paid in copper cash, and the silver tael is merely a convenient form of reckoning or carrying about the number of cash for which it will exchange. It has been stated that, while the price of silver in relation to gold has been going down, its purchasing power in China has remained constant. This would only be true if there had been no alteration in the exchange between silver and copper cash, and supposing the value of the latter in relation to other commodities to have remained unchanged. As a matter of fact, there has been a steady rise during the last few years in the silver price of cash; the year 1896 has witnessed a further considerable rise throughout China, attributed partly to scarcity and insufficient minting of the coin, so that the tael, which formerly exchanged for 1,500 cash, will now only purchase 1,200 or less. Side by side with this increase in the silver price of cash there has also been a marked tendency for the cash itself to depreciate in regard to commodities in general, so that the gold-price of Chinese commodities has not fallen to an extent by any means so great as has been generally assumed from the decrease in the exchange value of silver."

8755. I am not sure whether I gather from the answer you made earlier in your examination whether you hold that silver prices remain steady in silver countries—whether the fact of the mints being opened to silver would steady prices?—I think that silver has been much steadier in relation to commodities than gold has. I have here Mr. Sauerbeck's figures, which I will put in. There is a very remarkable addition at the bottom of that paper. These are the silver prices of 45 principal commodities for 20 years from 1874 to 1893, and also the index price of silver; and the addition of the index price of commodities is 1,603 for the 20 years, whereas the addition of the index price of silver for the 20 years is 1603·1, against the figure of 2,000 for gold.

(*For these tables see* Appendix.)

8756. After your evidence I need hardly ask you this; you would object, I suppose, to the introduction of a gold standard into India?—By a gold standard, do you mean a gold standard with convertibility between silver and gold at a fixed ratio?

8757. Yes?—With convertibility?

8758. Yes?—I believe in a universal gold standard; I should like a universal gold standard, but I think it is impracticable. It is not for our generation.

8759. Upon what reason do you base that?—I do not believe there is enough gold to do it. I think, in all the estimates that have been given of the gold that would be required to have a gold standard with complete convertibility, the estimates of the gold required are very much too low. We have an unknown quantity in hoards of rupees, all of which might under

Mr. W. H. Cheetham.

15 Nov. 1898.

certain circumstances come forward to be exchanged into gold. I am afraid to say the figure which I have got in my mind which might be required; it would be deemed extravagant.

8760. That is to say, you contemplate that the fact of being able to convert silver into gold would bring out the whole or the greater part of the silver hoards?—It would undoubtedly bring out a very large volume. It might bring out the whole.

8761. Why should it bring them out?—Because the people might prefer to hoard in gold. Many of them do. Within the last four months, I am assured by a Marwari broker that 2 crores worth of gold bars have been taken out of Calcutta and sent up country.

8762. You think that would be increased—that they would prefer hoarding gold coinage to gold bars?—I think there is a danger of it.

8763. Do you put that merely as a danger that must be considered, or as a danger concerning the probability of which there is evidence?—I think it is a danger that must be considered.

8764. You must face the risk of it—you must have it in mind?—Just so.

8765. Now, while the mints were open, and silver was falling, say, from 1876 to 1893, what was the state of Indian public finance year by year as regards surpluses or deficits? At page 56 of Part I. of the evidence taken by this Committee, Mr. O'Conor gives this evidence:—"1479. Can you tell us how the financial "position of India has stood since 1875, and whether "on the whole her revenue has exceeded her expendi- "ture?—I have prepared a statement of the surpluses "and deficits of those years, which I put in. It is as "follows:—" Then he gives a table, and he goes on: —"These figures show that in the 20 years ending "with 1892–3, that is, ending in March 1893, just "before the closure of the mints, there was an aggregate "surplus of Rx. 17,175,499, and an aggregate deficit "of Rx. 19,573,587, the not deficit in that period "amounting to Rx. 2,398,089. That was the result of "20 years' finance during a time when India is "supposed to have been extremely prosperous under "a continually declining rupee." I merely draw your attention to that, because those figures were put in. I do not know whether you have any observations to make upon them?—No, all I wish to say is that it includes a very large amount of war expenditure.

8766. Between 1885 and the closing of the mints in 1893, are you aware whether there was any increase of taxation?—The only increase I can call to mind was an increase in the tax on petroleum.

8767. The figures given by Mr. O'Conor would apparently show 4½ crores between 1885 and 1893?—The enhancement of the duty on salt was a general levelling up, if I remember right. We had different duties in different parts of India, and I think we levelled them all up to 2 rupees 8 annas per maund.

8768. Have you any further observations you would like to add?—I should like to state this as regards the cotton spinning trade. In Sir J. L. Mackay's evidence, question 320, he gave a list of the profits made by Calcutta and Cawnpore mills in the year 1897, on which he relied as a proof that the closing of the mints had not exercised a prejudicial effect upon the cotton industry. The Cawnpore mills have no trade with China, but the Bombay mills, which have, and which contain, perhaps, eight times as many spindles as the Calcutta mills, are not mentioned by him. You cannot take the Calcutta and Cawnpore mills as evidence of the general prosperity of the trade in cotton spinning in India. There are certainly six times as many spindles in Bombay as there are in Calcutta. The Cawnpore mills are not directly affected by the China exchanges; their customers lie all round about their mills; it is an absolutely internal industry. The Bombay mills rely very largely on their trade with China. They did very badly in that year, because of the plague, which absolutely crippled their production. For that very same reason the Calcutta mills benefited. We never had such a profitable year as we had in 1897. In the case of our own mills, we sent nearly three times as much to China as we had done in 1896. With the gradual resumption of fuller work in the Bombay mills, the prosperity of the Calcutta mills has absolutely disappeared. The mills are running at a loss now; they did not make depreciation in the first half of this year, and to-day they are running at a loss. One of the mills, which has preference shares, was unable to pay its dividend on the preference shares for the half-year ending the 31st August. In Bombay the trade is said to be worse than it has been for very many years.

8769. You are speaking now of the current year?—Of the current year; the trade is so bad that I do not think there is any doubt that short time would have been resorted to, but for the fact that we could not get the China and Japan mills to join in a short time movement. In Japan the trade has not flourished since the adoption of the gold standard. It was particularly flourishing before they had a gold standard; and, although they have adopted the standard of 32 to 1, or something like that, the cotton spinners have had to seek help from the Government to keep their mills going; they have had to get large loans from the Government to help them through. You will see in my memorandum the following paragraph, showing the effect of the fall in exchange:—"Before the "mints were closed, we used to sell our 30d/s drafts "on China against yarn at, in round figures, Rs. 225 "per $100. The rate has since been down to "Rs. 132 per $100, and is now a little over Rs. 140 "per $100. Taking it at Rs. 150 per $100, our "Chinese buyers have now to pay $84 instead of $56 "per bale to give us the same number of rupees that "we got when exchange was Rs. 225 per $100.

"$84 at Rs. 150 per $100 = Rs. 126
"$56 at „ 225 „ = Rs. 126."

I wrote out that paragraph without any reference to my own records, but afterwards I thought it would be advisable if I could give a concrete instance, and I looked at my records, and you will see I have added this paragraph: "In November 1892, when exchange "was Rs. 219½ per $100, we sold 10's to China at "$60 per bale, and in July 1897, with exchange at "Rs. 151½ per $100, we sold at $90 per bale." That paragraph was inserted after I had written the previous paragraph of the memorandum without knowing that there was such an instance in our books.

8770. (*Sir A. Dent.*) What was the price of cotton then?—I cannot give you the price of cotton on those particular dates; I can give you the price of the cotton we used in our own mills.

8771. It depends largely on the price of cotton and the price you sell at?—Yes. There was not very much difference in the cotton. Our clean cotton for the last half of 1892 cost us 44 pies per lb., that is July to December 1892. In 1897 our cotton for the first half-year cost us 45½ pies; for the second half-year it cost us slightly under 45½ pies. There is a difference of about 3 per cent.

8772. (*Sir F. Mowatt.*) Is that all you desire to add?—I think that is all I desire to add about the cotton-spinning trade. I should like to add a word about the stringency in the money market. The rate of discount is not the only criterion of the state of the money market. For instance, even when money has been very dear, 12 per cent., I have known a few bills discounted at perhaps 4, 5, or 6 per cent. below the Bank rate. I think you have that shown clearly in Mr. Allan Arthur's evidence; he has had the same experience as I have had. But those low discounts were no criterion of the money market whatever. It is a very peculiar thing. There are certain small Shroffs in Calcutta who have balances of, say, 10,000 or 15,000 rupees in their hands, and they wish to employ these sums for short periods. In our cotton trade we are drawn upon at 60 days' sight, and those people discount short bills at very much lower rates than we could borrow at from the banks. It is the same no doubt with the jute trade. Government paper is now utterly discredited, not only through the value

having fallen so considerably, but through the impossibility of getting advances against it, and these Shroffs would rather discount a short bill, giving employment for their money, than take the risk of putting into Government paper, when they might be put into a hole by being unable to get advances against it when they wanted to. We find that it is quite impossible to raise money for any commercial purposes. Suppose we want to issue industrial debentures, it is an absolute impossibility. It is not a question of price, but we cannot get the money. For the most promising industry we could not raise money on shares. The shares of dividend-paying concerns are nominally quoted in the papers, but you cannot sell them. Take the shares of a large steamboat company with which we are connected, which has been paying for years a steady dividend of 8 per cent.; if I want to sell 500 shares in that company I cannot do it; there is no money to buy them, and there has not been for many months. The debentures of the same company are absolutely unsaleable.

8773. Do you say that no new industrial concerns have been started in India during the last few years?—No, I do not say that. There was a large increase in cotton and in jute about three years ago, but many of the people who took shares then, and people who bought debentures, find great difficulty in getting rid of them now, and are put to great stress in order to take them up. Take another case. We undertook for one of our companies to build a branch line of railway. This was to be built in two sections. The total cost would be about 25 lakhs of rupees. For the first section we issued 4 per cent. debentures, and they were eagerly taken up.

8774. In what year was that?—That was in 1895 or 1896, perhaps 1896. I think it was just before the stringency became very manifest in 1896. Now the time has come to build the second part of the railway, and we want another 12 lakhs, we simply cannot get the money, nobody will take these debentures, we have got to find the money ourselves. Now, with a stringent money market, that is a very heavy loss indeed to the promoters of the railway. It is not the encouragement which Government should give to private enterprise. What I mean is this, that the Government, by closing the mints, have really, although they do not appreciate it, actually discouraged private enterprise in that way.

8775. You attribute to the closing of the mints your inability to raise capital for private enterprises?—Yes.

8776. That is since 1896?—I think it was up to 1896 that the money was available: I think it was in 1896 that we got the money to build a new cotton mill. In 1896, money only rose to 7 per cent. in the beginning of the year; it fell to 3 per cent. in the autumn, and the enterprises that I spoke of were all arranged for in, or before, August of that year. Between August and December the rate rose to 10 per cent., and since then there has been no market in industrial shares.

8777. What has been the rise and fall in Government securities during that time?—The 3½ per cents. have been between 109 and 110; the present rate is about 93.

(*Mr. Campbell.*) About three years ago it was close upon 110.

8778. (*Sir F. Mowatt.*) Have you anything else to add?—No, I have nothing more to say.

8779. (*Sir J. Muir.*) You mentioned that in 1893 the majority of merchants protested against the closing of the mints?—Yes.

8780. Was that the majority in Calcutta, or did it apply to Bombay also?—It applied to Bombay and Karachi.

8781. Calcutta, Bombay, and Karachi?—Yes.

8782. What is the feeling of the merchants now in these same cities?—I think it is clearly against the Government policy, with the exception of a number of eminent men, who might, perhaps, be counted on the fingers of one hand, who only emphasise the unanimity of the remainder.

8783. In other words, the great majority of the merchants in Calcutta are against the Government policy?—Decidedly against it.

8784. (*Mr. Campbell.*) Do you mean the Government policy as disclosed in their last despatch, or their policy in regard to the closing of the mints?—The closing of the mints.

8785. (*Sir J. Muir.*) And are the great majority of the merchants in Bombay opposed to it?—I think so.

8786. And in Karachi?—I do not know about the feeling in Karachi.

8787. In Madras do you happen to know what the feeling is?—No, I have no business connexions in Madras.

8788. Then your feeling seems to be against the closing of the mints in 1893?—Decidedly.

8789. And you think the mints ought to be re-opened?—I do.

8790. We have had witnesses before us who have indicated that the re-opening of the mints may mean a fall in the value of the rupee to a very low figure. Apparently you do not share that view at all. Your idea is that possibly it might be 12½*d.*?—That is my idea.

8791. Did I understand you to say that you hold strongly to the opinion that a rapidly increasing population such as we have in India requires, not a reduction of currency, but an increase, to meet the increase of population?—Certainly.

8792. Did I understand you rightly to say that the trade in cotton-spinning mills in India, having regard to the period when suitable cotton can be obtained, requires large quantities of cotton to be bought in February, March, and April?—Yes.

8793. And that formerly you were able to obtain facilities to meet your large purchases at about 4 per cent., whereas now you have to pay 9 or 10 per cent.?—Yes, cotton mills have to pay 9 or 10 per cent.

8794. That is a very heavy tax indeed upon the spinning enterprise?—No doubt.

8795. We had it in evidence before that in Bombay, while the nominal rate was 12 per cent., Parsees were unable to obtain accommodation from the bank on Government paper at even a much higher rate—that, in point of fact, they offered the manager of the bank at Bombay anything he chose to demand up to 18 per cent., and yet they failed to get accommodation, and were put to serious inconvenience, and, in fact heavy loss. Have you any information to that effect?—I have read the speech of the Chairman of the Bank of Bombay on the 4th August 1898.

8796. You understand pretty well about the tea industry. We have been seeing reports coming out pretty regularly for some months now, in which there is almost invariably the complaint that dividends have been very materially reduced in consequence of the 1*s.* 4*d* rate, as compared with the profits that they formerly realised. Does that coincide with your experience?—I do not attribute the present state of the tea industry entirely to the exchange. I think the tea industry is passing through one of those phases which all remunerative industries have to pass through. Too much land, for the time being, has been put under tea; the crop has been too large for the temporary consumption, and on that account the tea industry is undoubtedly passing through a severe crisis. Added to that, comes a certain additional difficulty through the exchange, which is the more felt because the industry itself is not in a flourishing condition.

8797. Referring to the disadvantage that India has through the exchange, did I understand you to intimate that it was about 36 per cent.?—I took that figure from Mr. Cameron's evidence.

8798. Have you any notion how many years China has enforced this tax that we have heard so much about?—I think from time immemorial the mandarins have had this likin tax.

Mr. W. H. Cheetham.

15 Nov. 1898.

8799. That is what I understand. Then it is hardly right to deduct this 14 per cent., which is an old-standing tax, from the 36 per cent. which Mr. Cameron stated was the disadvantage which the Indian planters were now suffering. He is made to say that 14 per cent., plus the 15 per cent. of advance in copper cash, made about 30 per cent.; so that he only made it 6 per cent. of disadvantage; whereas, if I understand you rightly, you would still call it 20 per cent., that is to say, you would add to the 6 per cent. the 14 per cent. ?—Yes.

8800. You said that the amount of gold required for a gold standard would be very large indeed, and you hesitated to name the figure which you had in your mind. I think it would be interesting to the Committee if you were to give us some indication upon that point, because there is a vast diversity of opinion; we have had opinions on one side, and I should like yours on the other, as to what amount you think would be needed?—I would rather not give any figure. It is an exceedingly large one.

8801. Would you say 50 millions in gold?—50 millions in gold I think would be inadequate.

8802. Seventy millions?—Now you are asking me to state what my opinion is.

8803. (*Sir C. Crosthwaite.*) Do you mean for a standard or a gold currency?—To establish a standard with convertibility.

8804. Absolute convertibility?—Absolute convertibility.

8805. (*Sir J. Muir.*) Do you think the natives would, if they had the chance, hoard it, just as we know they hoard rupees, and that a very large amount would disappear?—I think there is a danger of it.

8806. (*Sir C. Crosthwaite.*) You say you think the gold would disappear?—I think a large amount of it would.

8807. But you know that it is said that there is a great scarcity of rupees in India, so as to make it almost impossible to get them?—In circulation, yes.

8808. How would the gold disappear; how is it to be obtained? Suppose that the Government established a large reserve fund of 20 millions, how would that gold be drawn from the Treasury? I suppose only by exchanging rupees for it?—By exchanging rupees for it.

8809. If it is almost impossible to get rupees now, how could you expect to draw, say, 300,000,000 of rupees from the currency in order to draft away the Government gold?—Because at the back of the currency in circulation is an unknown hoard of rupees. In the evidence of Sir Antony MacDonnell he says that the great bulk of the savings of the people of India are in rupees, and not in ornaments. That coincides with independent evidence that I have got; I must say that it was a great surprise to me to hear it.

8810. You think there are sufficient hoarded rupees to come out and buy the gold?—I think there are.

8811. Why do not those hoards come out now to relieve the stringency, when you say there is such a stringency, and the discount rate is so enormously high? I suppose the people who have the hoards would buy the gold merely for the sake of the profit?—No, merely for the sake of hoarding.

8812. But they will not produce the rupees from their hoards for the sake of profit?—They never have done.

8813. I suppose the native banker trades for profit?—Yes, certainly.

8814. Therefore he will not keep an inordinate amount of his capital locked up, merely for the sake of having a hoard?—I do not think bankers do hoard in that way.

8815. Who do you think do hoard?—The people of India.

8816. That is to say, the whole population?—The whole population.

8817. Therefore the great mass of the hoards would be in very small amounts, would they not? Comparatively small amounts, 20 rupees here, 50 rupees here, 100 rupees there, and so on?—I think in very large amounts besides those small amounts.

8818. Here and there, I suppose, there would be some large hoards?—We have known silver of very early coinages come out by the cartload. I have in my mind now a very big lawsuit, in which a Maharajah was concerned, and in which the barrister's fees were paid by silver. All those rupees bore the mint mark of 1840. Of course I know that 1840 was a mint mark that lasted for a good many years. Every one of those rupees was as bright as if it had come from the mint the day before. There are very large hoards in temples and among the zemindars undoubtedly.

8819. Why do you think that they would come out to buy gold from the Treasury, when they could be used now? If they wanted gold, they could get the gold now?—They do not happen to want gold now, but, if you made gold the standard, you would give it an extra value in the eyes of the people, I should say. I do not say positively that the rupees would come out, but it is a danger that we have to apprehend.

8820. These hoards must combine. Even the largest would not do more than scratch at the Government reserve. They would have to combine?—No doubt.

8821. How would they combine?—I do not think there is any community in the world which has such powers of combination as the natives of India.

8822. For certain objects, I agree; but I have never known them to combine for such a purpose as this?—I have known them to combine for the purpose of keeping up the price of an article, or for the purpose of depressing an article.

8823. In trade they would combine, of course, but these hoards would not be in trade; they would be here and there among private individuals—chiefly men of hereditary wealth. However, you think that would be a danger?—I think it is a distinct danger.

8824. You admitted, I think, that the re-opening of the mints would render it necessary that the Government should raise a large sum by taxation?—Yes, I think it would.

8825. That would not be a mere temporary thing; it would be annual?—It would be temporary, because the prosperity of the country would increase so rapidly. May I read you this extract from Barbour's "Theory of Bi-Metallism," at page 150: "The fall "in the rate of exchange cannot have had a ruinous "influence on Indian finances, since the Government "of India had surplus revenue of 450 lakhs . . . "in 1882, eight years after the fall began, and has "since been able to meet all the ordinary cost of "administration without additional taxation, although "the further fall, subsequent to 1882, has thrown an "additional burden on the finances of nearly 200 "lakhs per annum." I suppose that refers to up to about 1885.

8826. In 1882 a remission of taxes was made by Lord Ripon. Since that the rupee has kept falling, has it not?—Yes.

8827. It is much lower now than it was in 1882?—In 1882 the exchange value was about 1*s.* 8*d.*

8828. Since then it has kept falling, we may say, pretty steadily?—Yes, there was a rise in 1890 up to 1*s.* 6*d.*, or something like that.

8829. There was a temporary rise, but, in a general way, it is correct to say that it kept on falling since that date, until after the closing of the mints?—When the mints were closed, it was 1*s.* 3*d.*, and it then fell, I think, to 1*s.* 0½*d.*

8830. I do not want the particulars, but it has fallen. Therefore the country ought to have been prospering still more; it ought to have continued to prosper. We ought to have had a more flourishing revenue by the end of 1894 than we had in 1882?—I believe the revenue did increase. We had an increased revenue, I believe.

8831. But there was a still greater increase of expenditure, was there not?—Well, of course, many people think that the expenditure has been unnecessarily high.

8832. Since 1884 there has been a large increase of taxation, has there not?—By the figures shown to me to-day I think it is about 6½ crores.

8833. And therefore, notwithstanding the fall of exchange, we have had to impose very considerable additional taxation?—Yes.

8834. Then what ground is there for believing that, if we re-opened the mints, we should not have to impose additional taxation to fill the deficit, but that the revenue would rise up to the mark required?—I think you would temporarily either have to borrow or to raise additional taxation.

8835. You say temporarily, but what ground is there for supposing that we should not have to do what we have had to do since 1884—what hope is there that the revenue will rise to meet the deficit—to meet such a large deficit as the re-opening of the mints implies?—The hope is this. At present the development of the country is arrested. Our industries are crippled by very dear money, by the impossibility of developing them.

8836. But what I want you to tell me is this. During the time the mints were opened and the rupee was falling, the revenues did not develope sufficiently to meet the deficit without additional taxation. How, therefore, can we suppose that now, after the re-opening of the mints, and when silver has still more fallen, and a very large deficit will have to be met—how can the responsible Government of India act on the supposition that the revenue will rise?—I think the Government would have to impose fresh taxes, but I think the country could bear them.

8837. Even up to the extent of, say, 8 or 10 crores?—Sir Antony MacDonnell, I think, says that he considers the country could bear from 6 to 8 crores more taxation than it does at present.

8838. (*Sir A. Dent.*) Does he say that?—I think that is in his evidence.

(*Sir A. Dent.*) He says it in a very qualified way.

8839. (*Sir C. Crosthwaite.*) Why do you think the country will be able to bear it if the mints are opened?—I think the fall in exchange would increase production very much. I think the farmers, who represent the great body of the population, would get a great deal more silver for their produce, and would be able to pay a portion of it into the Treasury.

8840. You think that prices would rise greatly?—If silver falls, or rather if exchange falls to the parity of silver, I have no doubt they would get more.

8841. The tea-planters have told us, and that I take to be the great argument from the manufacturers' point of view also, that the prices of food and wages would not rise; that you would still be able to get labour in India at the same price as hitherto?—Wages paid in kind, of course, are not affected by a rise or fall in price at all.

8842. Practically they do rise and fall with the price?—They do not rise and fall with the price; they are not affected; you can leave out of consideration all wages paid in kind.

8843. I understand that you hold that, because the rupee is not on the natural basis of its intrinsic value in silver, therefore the cotton spinners in India are at a disadvantage with the China mills?—Yes.

8844. And some of the tea-planting interest have also told us that owing to the same cause they are at a disadvantage in competing with China tea?—Yes.

8845. They explain it by saying that, whereas the China people are able to pay their expenses in cheap silver, the manufacturers and planters in India are obliged to pay their expenditure in the more expensive rupee. That I understand to be the argument?—Yes.

8846. If the re-opening of the mints causes the prices of food grains in India, and therefore, in the course of a little time, at any rate, the cost of wages, to rise, I do not see how you can argue that the re-opening of the mints will be such an advantage?—As far as cotton manufacturing is concerned, the rate of wages paid is so very much in excess of what agricultural labour is worth that a rise in the price of grain does not make so much difference to them, and there is no reason to suppose that wages in the principal manufacturing districts would rise except very, very gradually.

8847. Then where is the disadvantage at which you are placed with regard to China by the closing of the mints?—The disadvantage is, that we are paying these wages in the more expensive standard.

8848. You do not think you would give them any more rupees, even if you opened the mints?—I do not think we should in those manufacturing districts.

8849. Then it would not benefit the great mass of the labouring population?—The great mass of the labouring population is of course agricultural.

8850. They get their payments mainly in kind, and therefore they would gain nothing by the re-opening of the mints?—They would gain nothing on that.

8851. You as employers would gain, because you would not have to pay them anything more?—We should not pay them anything more. The rise would be very gradual.

8852. Therefore any advantage that would come from the re-opening of the mints would go, not to the whole country, but to certain classes?—It would go to the class which is most important, the agricultural class which tills its own leasehold land, which includes 70 per cent., perhaps, of the total population of the country.

8853. They would get more rupees?—Yes.

8854. But those rupees would not be worth so much, would they?—No; but, as their expenditure is not as large as their income, they would have a bigger margin of profit.

8855. Do you know the average acreage of holdings in India, about?—No, I do not know that.

8856. With regard to the other way in which you say the loss could be met, namely, by borrowing, I suppose you would only propose that as a very temporary expedient?—Quite so.

8857. You talk of the borrowing of gold by the Government of India to establish a gold standard as a similar measure. Is that quite fair; the Government borrowing gold with the view of putting it in reserve, and thereby establishing a gold standard, is one thing, but you propose to borrow a large sum merely to sink it in the deficit of the first year's operation?—The advantages to the country of a silver standard are so paramount that I think it would be better to borrow for that purpose than to borrow for gold.

8858. (*Sir F. Mowatt.*) You mean borrowing from year to year to fill the deficit?—Yes; I have a great objection to borrowing certainly; but I say I would rather do it for the sake of the silver standard than borrow to establish a gold standard.

8859. I think you went as far as this, did you not, that you prefer to borrow to meet a deficit, rather than to increase taxation to an amount sufficient to put an end to the uncertainty?—No, I beg your pardon, I did not say that.

8860. (*Sir C. Crosthwaite.*) I should like to ask a question with regard to the railway you mentioned. You said you were able to raise debentures at 4 per cent. in 1896?—I think it was 1896.

8861. And after that you were not able to place any debentures?—You cannot place a debenture at all.

8862. And you attribute that to the closing of the mints?—Yes.

8863. Would you explain how you would have been able to get the money, supposing the mints had been opened?—If the mints had been opened there would have been a free supply of currency.

8864. But I do not understand how that would give a man money to invest. The man who wants debentures has certain savings to invest. If I am not able to invest now because I have no money, I do not see how the re-opening of the mints will give me money?—When the money market gets into a state of extreme stringency, neither the banks nor anybody else will lend money; they keep everything they have in reserve.

Mr. W. H. Cheetham.

15 Nov. 1898.

8865. I suppose other securities might be sold to take your debentures?—Possibly.

8866. And those are not saleable?—I do not think any securities are saleable.

8867. Do you think the re-opening of the mints would make them saleable?—Yes; after the shock was got over, it would give confidence. I believe that the re-opening of the mints would give a great shock, but it would be got over.

8868. You say that there is now a monetary stringency, but anyone who takes gold to the Treasury can get rupees at the price of 15 rupees to the sovereign. What is the reason that is not done; is it because the price is too high, or because there is no confidence?—I think it is want of confidence.

8869. If the Government of India fixed their policy and established confidence, that would be a point gained?—If they established confidence; but could they establish confidence?

8870. But that is one of the important points—suppose that they established confidence?—I do not think they can establish confidence.

8871. Not in a gold standard?—Not in a gold standard.

8872. But you think that, if they re-opened the mints, that would establish confidence?—I believe so.

8873. Although there would be no certainty that the loss might not be so heavy as to compel them to close the mints again? They have closed the mints once, and, if they are re-opened as an experiment, especially accompanied by borrowing to fill the deficiency, do you think there would be confidence in the maintenance of that position?—I believe so. I do not think the Government, if they once re-opened the mints, would ever close them again.

8874. (*Sir A. Dent.*) You were referring just now to Sir Antony MacDonnell's evidence. I suppose you were thinking of his answer to question 5856, on page 217, in which he said, "I believe myself that "the country could now afford, without injury to "industry or commerce, 6 or 8 crores of additional "revenue." You were thinking of that, no doubt?—Yes.

8875. But have you followed the other answers that he gave from 5856 to 5884? He immediately qualifies his first answer at question 5867. He says: "But, "to raise that, you would have either to incur a "breach of faith, by increasing the land revenue in "spite of the land settlements, or you would have to "impose unaccustomed and new forms of taxation; and "I, as a responsible administrator, should fear the "result of doing that." You have read the rest of those answers of his?—Yes.

8876. I thought it was only fair to bring that out?—I ought to say that I was not proposing to raise the land revenue, or anything of that kind. My proposal was that the amount required should be raised by indirect taxation, in the shape of import duties, which those cultivators and other people in the North-West Provinces would not realise that they were paying.

8877. But all Sir Antony MacDonnell's answers after 5856 seem to me to be rather against the possibility of further taxation?—I think he is referring to direct taxation in the form of land revenue.

8878. Now you say that you think gold might be freely bought out of hoards in India, if it was made a standard?—No; what I said was that I thought gold might be substituted for the hoarded rupees.

8879. Do you think, if a gold standard was established in India, the natives would bring out gold from their hoards and convert it into sovereigns? In other words, would they not sooner hold gold in the form of coins than in the form of bars? They could hoard it equally well in either way?—I do not know. Judging by the analogy of silver, I suppose they might like to have their gold coins.

8880. That would greatly help the establishment of a gold standard in India, would it not?—Not at all, if they put the gold coins back into the hoards from which they took their bars. The form in which they hoarded it would not have any effect whatever on the circulating medium.

8881. My idea was that, when it was put in a form in which it is easily circulated, as a sovereign, it would be less liable to be hoarded than when it is in such a cumbersome mass as gold bars?—But we have the analogy of silver, in which they prefer to hoard rupees.

8882. But are we so certain that they do hoard rupees? You think they must hoard gold, because the gold is not visible, but that is not the case with silver?—We know that an enormous amount of silver has been imported during the last 60 years.

8883. Are you aware that large numbers of sovereigns did circulate up to 1866, or thereabouts?—I have never seen them in circulation. If I want a few sovereigns I can buy them—I can buy them in the bazaar—but I should be surprised to hear that sovereigns ever circulated in the interior of the country for the purposes of trade.

(*Mr. Campbell.*) They were received at the Government Treasuries, but they were not in circulation in the country.

(*Sir C. Crosthwaite.*) There were great numbers at one time in the country; they were not hoarded.

8884. (*Sir A. Dent.*) You said you had no fear of a decline in the price of silver and that the mines were producing less silver than they used to?—Proportionately.

8885. But are you not afraid that, if the price of silver advanced, those mines would enormously increase their production?—I think an effort would be made, naturally, to increase the production, if the price of silver advanced very materially; but I do not think that would come into operation until the price had considerably advanced. It is one thing to carry on a decaying mine, which pays at a certain rate; a man will go on working his mine at a loss in the hope of a turn in price; but, once that mine is shut up, it is a very different thing to open it again.

8886. You attribute to the closing of the mints your trouble in negotiating shares and also the issue of debentures for your railway: but has there not been during the last year or two the same difficulty in other markets than Bombay in realising shares or issuing debentures? Has not Bombay been suffering from exactly the same thing as the London market, for instance, or the Paris market?—I am not well acquainted with the course of the markets in London. Many of the markets in London are, I think, absolutely speculative markets—the mining market, for instance. There I can understand very well that there has been very great depreciation in values.

8887. I think people in business in other commercial centres have found, in the last year or two, great difficulty in handling new issues and bringing out new companies. You consider that Bombay was rather specially disadvantaged?—I am speaking of Calcutta; I do not know about Bombay. I should have thought that there was no comparison at all between the state of the Calcutta market and the state of the London market. I think even now any sound industrial concern or any railway offered on the London market would find capital.

8888. Then you said that money that you used to get on cotton at 4 per cent., you have now to pay 9 per cent. for from the banks?—The Bombay mills have had to pay from 9 to 10 per cent.

8889. That has only been for the last 12 months perhaps—the last season?—The last two years 1897–98.

8890. Then was not 4 per cent. a very exceptional rate in India on which to borrow money for cotton?—I do not think so, we had that for several years.

8891. You are taking an extreme in the one case of 9 to 10 per cent.; are you not taking an extreme in the other, when you talk of 4 per cent.?—4 per cent. was the minimum, but we had it for long periods at 4 per cent. I was only speaking of our own particular concern then.

8892. (*Sir Francis Mowatt.*) Was that for very short loans?—The way is this. We borrow the money in the spring of the year, and, as the cotton is worked up in the mill, and the yarn is sold, we gradually pay off the loans, so that towards the autumn the loan is wiped out.

8893. So that the loan is wiped out practically?—Yes.

8894. Did I understand you to say that it was not an unusual thing that you should be able to borrow for four or five months at 4 per cent?—Yes, we did that for several years.

8895. For many years?—For several years. I will not say many years.

8896. (*Sir A. Dent.*) Then you have had to pay 6 or 7 per cent.?—Yes. Our arrangement was that we should pay 1 per cent. over the Bank rate, with a minimum, but the Bank rate went to 3 per cent., at any rate for some considerable periods.

8897. (*Mr. Campbell.*) I think you said that although the Bank of Bengal rate is only 5 per cent., money is stringent?—Yes.

8898. I suppose you are aware that the Presidency Banks' cash balances are at present pretty full?—Yes, I think they are.

8899. So that, judged by that criterion, there is no stringency?—Quite so.

8900. I suppose there is no difficulty in obtaining short loans at the Presidency Bank rates?—No, you can get short loans at the Presidency Bank rates, or a little under, perhaps.

8901. (*Sir F. Mowatt.*) What period do you cover by short loans?—Two or three months.

8902. (*Mr. Campbell.*) Then it is only with regard to loans extending over a lengthened period that you might call money difficult to obtain?—Yes.

8903. Would you say that that is caused, not so much by actual stringency at the moment, as by fear of money becoming stringent under existing circumstances, as it has done in the last two years?—I think it is the fear of further stringency in the spring.

8904. With the mints closed, and no possibility of relieving it except by means of sovereigns at the 1*s.* 4*d.* exchange?—Yes.

8905. You also said that you do not see that a falling exchange necessarily stimulates exports, but I think you added that a falling exchange might only be the indication of an adverse trade balance?—Between two countries with the same standard.

8906. Between any two countries, if exchange falls?—I think there is a very great difference between a fall of exchange between two countries, one of which has a gold and another has a silver standard, and a fall of exchange between two countries who each have the gold standard.

8907. Do you mean in the ease of adjusting it?—The ease of adjusting it, and also in its effects on prices.

8908. But between two countries having the same standard, the fall of exchange cannot go past the remitting point?—Exactly.

8909. But you say the fall of exchange stimulates production?—The fall of exchange in a silver country like India, with open mints, does stimulate production by its effect in raising prices.

8910. As exports are only surplus production, would you not say that that stimulates exports?—It certainly stimulates exports.

8911. Would you put it in this way, that a fall in exchange, by its stimulus to production and exports, is what enables an adverse balance of trade to be adjusted between a gold-using country and a silver-using country?—Certainly.

8912. Now, on the question of India's trade with China, you say that the closing of the Indian mints led to a very serious fall in the China exchange?—It did.

8913. So that, to sell at the same price in China or Japan, the Indian mill had to lessen its cost of production?—Yes.

8914. If it could not lessen its cost of production, it had to get a higher dollar price?—Just so.

8915. You are aware, no doubt, that the China and Japan mills use Indian cotton to a very large extent?—A very great change has come over the Japan trade. They are taking an enormous quantity of American cotton now.

8916. They may do that, but they are still taking a very large quantity of Indian cotton?—I think the imports of Indian cotton into Japan are probably, this year, only one third of what they have been.

8917. Of raw cotton?—I believe so, from India. I believe in the previous year the exports of cotton were something like 220,000 bales.

8918. The exports of cotton to Japan in 1895-96 were 2 crores 44 lakhs in value, and in 1896-97 3 crores 76 lakhs, and in 1897-98, which is the latest return we have, 3 crores 25 lakhs?—My information now is, from a man who does a very large proportion of the trade, that Japan will take very little of this current crop of cotton from India owing to the cheapness of American cotton, and that his firm is doing a very large business in American cotton for Japan.

8919. The point I want to put is this, that to the extent to which China and Japan use Indian cotton they have no advantage over the Indian manufacturer?—Through the operation of exchange, not the slightest.

8920. The one equalises and counter-balances the other?—Quite so.

8921. Then it would be only when the China and Japan mills begin to use their own native-grown cotton, or American cotton, that the exchange question would come into play?—As regards the raw material, yes.

8922. Have you any statistics or information as to the extent to which China is beginning to grow cotton for her own mills?—There has always been a certain amount of cotton grown in China. I remember in 1861-65, during the American War, when there was what was known as the cotton famine, that China cotton was imported into England. We do not find it a very suitable cotton for spinning, ourselves, but it undoubtedly is used in the China mills.

8923. Native grown cotton?—Native grown cotton, undoubtedly.

8924. Have you any information as to whether the growth of China native grown cotton is increasing?—I have seen a newspaper report to that effect, but I do not place any reliance upon it. I do not know.

8925. If it should increase, it would be a more serious blow to the Indian trade than anything which has occurred yet?—It would be a very serious blow.

8926. It would be a blow, not only to the manufacturer, but to the Indian producer?—Just so.

8927. Then the Indian mills also compete with Manchester for the supply of the Indian home market?—Nominally they do. Practically they have ousted Manchester from the production of the coarse goods which they are able to manufacture. There is an attempt in Bombay now to spin finer yarns, but it has not succeeded to any great extent. As regards the bulk of goods manufactured in India, it is of such a coarse texture that Manchester cannot compete with it, and it has lost the trade for some years now.

8928. Has not the fall of American cotton enabled Manchester to compete to a certain extent in these coarse goods?—I should say not.

8929. Is it not the case that American cotton has fallen to a greater extent, and in much larger proportion, than Indian cotton in price?—I should say it has fallen, but, as the qualities are so different, it is rather difficult to make an exact comparison. Taking the 1*s.* 4*d.* exchange, the cotton they are using in our mills you may put down at 2½*d.* per lb.; the price of American middling to day is 3*d.* That is a difference of 16 per cent.

8930. Would you consider that a high exchange gives Manchester an advantage?—Yes, it gives Manchester a slight advantage.

Mr. W. H. Cheetham.

15 Nov. 1898.

8931. The Indian mills you have told us work largely on borrowed money ?—They very largely use borrowed money, just to lay in their stocks of cotton.

8932. And, the higher the rate of interest they have to pay, the more it will tell on the profit they earn ?—Undoubtedly, very much.

8933. Does the higher rate of interest affect other industries besides the mill industry ?—It affects the jute mills. The jute mills in the autumn have to lay in very heavy stocks, for the same reason that the cotton mills have to lay in heavy stocks in the spring. It affects also indigo factories, which work largely on borrowed capital.

8934. How is the internal agricultural industry affected by a rise in the value of money ?—I do not think that it is much, if at all, affected, except as the stringency in the money market affects the demand for their produce. I doubt if the rates of interest charged to the cultivator are higher because there is a stringent money market at the seaports.

8935. They are not higher ?—I doubt if they are higher.

8936. I suppose they are always high ?—They are always high, I think.

8937. You object to a gold standard ?—Yes.

8938. Has the basis of 1*s.* 4*d.* anything to do with your objection, or do you object to it *in toto* ?—I object to it because it is not a natural basis. I object to any rate being fixed.

8939. Would you admit that there might be advantages to India in having a gold standard, seeing that about 80 per cent. of her trade is with gold standard countries ?—I do not think that that affects the question. The bulk of England's trade in the early part of this century was not with gold standard countries. When she adopted the gold standard, it did not affect her profits, it did not affect the volume of her trade in any way.

8940. If the ratio were brought nearer the intrinsic silver value of the rupee, would that lessen your objection to a gold standard ?—It would not lessen my objection. I think any ratio which is not of the actual value of silver is objectionable.

8941. You say one reason why you object to a gold standard is the difficulty of obtaining the gold ?—Yes.

8942. But are you aware that the production of gold in the world is increasing very largely of late ?—I am.

8943. That does not affect your opinion ?—Some surprise has been expressed that prices have not risen owing to the increased volume of gold produced, but it seems to me that, by the demonetization of silver, there was a very tremendous gap to be filled up before any increase in the production of gold would have any effect ; and, although the production of gold seems to be very large, it is not a very large per-centage on the total stock of gold in the world.

8944. You also say that there will be considerable danger of the gold being hoarded ?—I think there is.

8945. Gold is now obtainable at slightly over 15 rupees to the sovereign ?—Yes.

8946. So long as exchange is not put up over 1*s.* 4*d.*, gold cannot be cheaper than that ?—Just so.

8947. So that, unless there is an idea (which we have not heard of) of raising the ratio higher than 1*s.* 4*d.*, gold is now at its cheapest ?—Yes.

8948. But is there any indication of unusual hoarding going on now ?—The only case I have heard of is these Marwaris, who have turned their property, as much of it as they could, into gold, and have sent the gold into their native country. That seems a remarkable movement.

8949. Was not that from fear of the plague ?—Probably the plague had something to do with it.

8950. I heard that same story, and I was told that they were so frightened of the plague that they were deserting Calcutta and taking their gold and everything else with them ?—But they have not brought it back.

8951. (*Sir F. Mowatt.*) Have they come back themselves ?—Numbers of them have.

8952. (*Mr. Campbell.*) How is it known that they have not brought it back ?—Well it is not known. At any rate, they seem disinclined to turn it into capital available for carrying on business.

8953. One criterion of the extent of hoarding would be the extent of India's imports of gold from this side ?—Yes.

8954. There has been no marked increase ?—Besides the imports of gold, there is a certain production of gold in India itself, about three-quarters of a million sterling per annum ; it is only the balance of the exports and imports that is shown.

8955. There is no marked increase in that way. So that if, with gold, at its very cheapest, there is no unusual hoarding going on, is there any reason to suppose that, if a gold standard were introduced, even at 1*s.* 4*d.*, there would be any increased hoarding ? And, at a lower rate than 1*s.* 4*d.*, which would mean a higher price for gold, is it not reasonable to assume that there would be less inducement to hoard ?—The danger I see is that the natives might wish to exchange their hoards of silver for hoards of gold—not to increase their hoards, but to exchange them.

8956. They can do that now on the cheapest possible terms, and they do not ?—But circumstances might arise at any moment, especially if the Government stamp were affixed to the value of the gold, which would make the natives think that it would be better worth hoarding than silver. That is the danger I see.

8957. Have you any information as to the prevalence of illicit coinage ?—I can give no proof.

8958. I mean the coinage of a silver rupee which is instrinsically as good as the Government rupee ?—There is a very widespread belief that it is going on to a considerable extent, especially in the native states ; but, short of capturing the coiners and discovering their implements, I do not see that any proof is possible.

8959. What is the practice of Government at the present time with regard to light coins ?—Any light coins that we send to the bank are cut, and the pieces are returned to us, by which they become only of their bullion value, so that we lose, say, 6 annas on every light rupee, in addition, of course, to the loss of weight.

8960. The loss falls on the last owner ?—On the last owner who presents the rupee.

8961. Have you formed any idea of the proportion of coins thus cut up ?—I have not. In our firm we make our native establishment responsible for all fraudulent coins and all light coins, and I have no means of ascertaining the proportion of light coins.

8962. (*Sir J. Muir.*) Have these coins been light from the beginning ?—I am afraid a great many of them have been sweated. The natives will put a lot into a bag, and shake them up till they can collect a lot of dust from the bottom of the bag.

8963. (*Mr. Le Marchant.*) In speaking of these coins, it is the case, is it not, that the Government make an allowance for fair wear and tear ? I quite understand that, where they are sweated, they would be returned in the way you describe, but does that apply to all cases ?—I understand it does. Mr. Campbell has told me that the coinage of a particular year, which was withdrawn from circulation, was accepted by the Government at the full value, but my recent information from Calcutta is that all light coins are cut and the pieces returned.

8964. You were speaking of the importation of silver in or after the year 1878 ; do you attribute that to the high rate of discount and the demand for money ?—Yes, in 1876 and 1877 the average rate of discount rose very high, and that immediately seemed to draw silver from Europe.

8965. Do you consider that there were any other important causes which bear on that importation of silver ; or was that the chief cause ?—I see on the diagram that the line follows approximately the same variation in almost every case. If there is a high rate of discount, the import of silver immediately increases.

In 1890-91, owing to the apprehension, I suppose, of the mints being closed, there was a very large importation of silver, and down went the Bank rate.

8966. Was it not the case in 1877 that there had been a very heavy fall in the price of silver?—There was a rise in the rate of exchange in 1877.

8967. Did that concur with a fall in the sterling value of silver?—No; that concurs with a rise in the sterling value of silver. 1877 was a year in which there was a little break in the drop in exchange.

8968. The table which I have before me shows that the average price of silver was in 1875–76 $56\frac{7}{8}$ pence an ounce, and in 1876–77, $52\frac{3}{4}$ pence. A fall of 4*d.* would conduce to sending out silver?—I suppose the cheaper an article is, the more people will take of it, as a rule.

8969. Was it not the case that there were heavy Government borrowings in sterling at that period?—I have not the figures before me.

8970. Government borrowing in silver would be another cause, would it not?—There was a period from 1874–75 up to 1877–78 of very heavy borrowing.

8971. Sterling borrowing as well?—Sterling borrowing as well.

8972. That would, so far as it went, be a contributing cause, would it not?—I think so. Borrowing in sterling would probably reduce the amount of Council bills offering, and silver might be sent out instead.

8973. I think you were alluding to the remarks of a previous witness as to the increase of business in the cotton mills of Calcutta. May I ask whether there has been an increase in Bombay also, in out-turn? Of course I am aware that in the plague year there would naturally be a less out-turn, but taking the succession of recent years, would you say that the number of spindles employed has been more or less?—The number of spindles has been increasing undoubtedly.

8974. And the production naturally with it?—Naturally.

8975. That would point to a certain expectation of profit in the trade?—In Bombay they say it points to an expectation of profit on the part of the agents, who get 3 pies a lb. on the production of the mills under their charge.

8976. Still, I suppose, that is within the power of the employers to some extent?—Many of the mills in Bombay are worked on that principle. By employers, I suppose you mean shareholders?

8977. Yes, directors representing shareholders?—Many of the mills are worked on that principle, and there has been great complaint in Bombay about it.

8978. Have you any information as to the profit or loss of the mills established in Japan?—No, I have not.

8979. As to the mills in China, have not some of them changed their locality, with a view of more profitable business in a different spot?—You can hardly move a cotton mill.

8980. You can start a new one?—But you leave the old one up. I have got a list of the mills in Shanghai, and the mills at the out-ports, and also I see that another mill is being started at Hong Kong, but I have no information as to the exact results. I think I have already said that under Chinese management they gave very bad results.

(*Sir A. Dent.*) That is the case. I think some of the Chinese mills are in a very bad way just now, and the mills under the management of Europeans seem to be just holding their own, and one or two of them pay small dividends. That is the last news from Shanghai.

8981. (*Mr. Le Marchant.*) I think you were alluding to difficulty in placing the shares or debentures of joint stock enterprises in India. Do you know if there has been an increase, or the reverse, of the capital of companies registered under Indian law in recent years?—Oh yes, undoubtedly an increase.

8982. Up to a comparatively recent date?—Up to 1896 certainly.

8983. Do you consider that the recent absence of markets may be owing to some temporary causes?—I consider that it is owing to the closing of the mints.

8984. But that has only taken effect in the last few months?—Since the end of 1896. The Bank rate ran up in the autumn of 1896 from 3 per cent. to 10 per cent.

8985. Would you say that, with open mints, sterling capital went more freely into all forms of investments, take railways for example?—I have not had experience of sterling railway bonds, I do not know about that, but I do consider that as long as the mints were open there was a free, full flow of capital from England for industrial purposes.

8986. Has it not been necessary, for the Government to raise capital for railways to a very large extent in a sterling form and with a guarantee?—The Government have offered guarantees to private individuals and companies to induce them to make railways undoubtedly, a guarantee of 3 or $3\frac{1}{2}$ per cent.

8987. Do you think that policy would have been pursued, if rupee capital could have been obtained at similar rates?—Without the guarantee?

8988. Or even with the guarantee?—Possibly not. Railways require such an enormous amount of capital. In our own case, where we only wanted 25 lakhs, there did not seem to be any difficulty in getting it.

8989. You think it is a question of amount?—Also I think on the Bombay side there are two or three railways which have been built in the same way with rupee capital.

8990. Some have been subscribed since the closing of the mints, have they not?—Our own railway was subscribed since the closing of the mints, and before the stringency of money became effective.

8991. In speaking of stringency, do you think there were any causes besides want of currency which contributed to it?—Of course there are always causes which are in operation; for instance, we have busy seasons and we have slack seasons, and we expect to have dearer money in the busy season than in the slack season.

8992. Did the Government expenditure on railways, war, and famine, withdraw money from bank centres?—I think probably the expenditure on war did withdraw a considerable amount of money from the commercial centres.

8993. And the inability of Government to offer Council bills would, to a certain extent, have affected it?—The failure to sell Council drafts is equivalent to being unable to draw money from the Treasury. The Council drafts are the means by which money is withdrawn from the Treasury.

8994. And placed at the disposal of the market?—No doubt.

8995. But, in the absence of these, the market would to that extent have been bare of funds?—Yes, the market always expects to be able to get these Council drafts.

8996. That would have been a contributing cause?—If the Government refuses to sell Council drafts, of course it tends to make money scarce.

8997. But, if remissions of revenue are necessary, the Government cannot sell drafts as usual?—If it has not money in the treasuries, of course it cannot sell Council bills.

8998. It has been suggested that that money, wherever it may have been, would have performed the same service to trade as if it had passed through the Government into the hands of bankers. Would you be of that opinion?—Certainly not. Take the money that is expended on a frontier war. It takes a very long time for that money to dribble back into commercial channels.

8999. And equally if the revenue was not collected, so that the rupees remained up country?—If the people who cultivate the land have the rupees in their possession the revenue is not remitted, because they have to pay their rent.

Mr. W. H. Cheetham.
15 Nov. 1898.

9000. Where would you consider the rupees would be in the case of the Government remitting taxation?—If Government defers collecting revenue, it is because they think the people cultivating the land are not in a position to pay it, and have not got the rupees to pay

9001. But, in the result, the funds would not be coming to the banking centres to the same extent as in the ordinary course?—If the Government has not the money in the treasuries, it is not available for Council drafts at the banking centres.

9002. And stringency to that extent would be increased?—Yes, certainly.

9003. Do you think stringency arose to some extent from the tendency to remit capital out of India at that time?—I think there was a tendency to remit capital out of India when exchange rose to about 1*s.* 4*d.*, and there were a great many instances in which more would have been remitted but for the fact that the persons who wanted to remit it were utterly unable to realise their securities. Their securities or Government paper they could not realise, or they would have remitted.

9004. Would the same cause have deterred capital from going out at that time?—Not if there was remunerative employment in India.

9005. But for the purposes of being lent for short terms?—That is a question for bankers, not for me. We merchants do not lend money for short terms. It is part of a banker's business.

9006. Were the banks influenced by apprehensions of a fall in exchange?—I think they wanted to be secure. They were sterling banks, and they wished to have all their capital, at all events, in the standard of which their capital was composed.

9007. But it would be the anticipation of an eventual fall of exchange that would determine them?—I suppose so.

9008. How far, with open mints, would the same conditions occur, if the sterling price of silver were falling?—I think that is a banking question. As far as a commercial man is concerned, I think, if he sees remunerative employment for his money in India, he will send it out. I do not think that we had any difficulty in getting money when the mints were open.

9009. But discount rates did rise frequently in crop seasons?—Of course there were fluctuations, sometimes high and sometimes low.

9010. But there was a frequent recurrence of high rates?—As a rule the rates always rise in the spring, about January and on until April, and then they fall, and in the autumn months you have the lowest discount rates.

9011. Can you point to any previous occasion when there was such a concurrence of circumstances—war, famine, and plague—contributing to stringency? For instance, it was not so in 1877-78?—No, perhaps not. I do not suppose there have been so many circumstances concurring before.

9012. If a gold standard were established, and confidence were secured, do you consider there would then be the same difficulty about money flowing out to India?—If there were confidence, I believe the money would go out; but I do not see how you can establish confidence in a gold standard.

9013. In the case of other countries that are on a gold standard, for instance, the United States and England, do you consider that money flows to and fro easily?—Yes, it comes very easily indeed. Of course, very often it is not necessary to send money, because it can be adjusted by bills and banking facilities, but gold does come freely from the United States, and goes back there freely on occasion.

9014. Still the possibility of its moving easily mitigates the difficulty to a large extent?—It obviates the necessity of moving it very often—the fact that it can be moved so easily.

The witness withdrew.

Mr. D. Graham, C.I.E.

Mr. DONALD GRAHAM, C.I.E., called and examined.

9015. (*Sir F. Mowatt.*) Will you state your qualifications?—I am an Indian merchant, a member of the firm of William Graham & Co. My head-quarters are in Glasgow.

9016. You are also a member of the Glasgow Chamber of Commerce?—Yes.

9017. Do you attend here as representing them?—No, simply as representing my own views.

9018. And as regards your firm, do you represent their views?—I am speaking for myself, but I ought to explain that my partners generally concur with me. There are two who do not. There are two who are in favour of a gold standard, if it can be managed; but both are against currency contraction. One thinks that convertibility might be guaranteed by the Imperial Government.

9019. The evidence you are giving to-day is practically your own evidence?—Practically my own evidence.

9020. (*Sir J. Muir.*) And that of the majority of your firm?—The majority, except the two I have mentioned.

9021. (*Sir F. Mowatt.*) As I shall have to take you over very much the same ground as the witness who preceded you, perhaps I may, with a view to shortening your evidence, ask you generally whether you agree with the evidence Mr. Cheetham has given. First of all, did you hear his evidence?—I heard a good deal of it.

9022. Does that generally represent your own views?—Yes, generally. I might express myself differently perhaps in some ways.

9023. You were not called before Lord Herschell's Committee?—No.

9024. But you wrote a letter to Lord Herschell which was printed in the blue book?—Yes.

9025. Practically, do you adhere to what you said in that letter?—I adhere to the evidence I then brought forward.

9026. We may take it, therefore, that you were opposed to the closing of the mints, in 1893?—Yes.

9027. And were you opposed to it on the ground which the previous witness went into, or would you like to specify the particular grounds on which you base your opposition?—Perhaps I had better specify my own grounds. The first objection I had was, the depreciating of the value of the silver ornaments of the natives. I thought it was a wrong done to the people of India, and impolitic.

9028. That assumes that the silver ornaments had been purchased when the rupee was at a higher price?—Well, they were purchased at the rupee value, weight for weight; they were the same value as the rupee, whatever its sterling price was.

9029. But the value of the rupee has increased since that time. Many of these ornaments may have been bought when the rupee was lower than it is now?—Yes, but in old times the silver in ornaments was always of equal value, weight for weight, with rupees.

9030. What I wanted to have explained was this. In the case of an ornament purchased when the rupee was at 1*s.* 2*d.*, if it was brought out and sold when the rupee was at 1*s.* 4*d.*, the owner would not lose so much by it?—Well, the owner would know nothing about the sterling value of silver. He simply sold it for rupees, weight for weight.

9031. But he might not lose appreciably?—If it was separated from the rupee, he would lose.

9032. Although he bought it when the rupee was of a lower value?—Yes.

9033. (*Mr. Campbell.*) With open mints he would always get 106 rupees for 100 tolas, whereas now he

would get 70?—Exactly; when the mints were closed he would only get 70 as against 106.

9034. (*Sir J. Muir.*) Therefore, there was a heavy loss?—A heavy loss. My point was that, from time immemorial, the native holder of ornaments had been accustomed to look upon ornaments as weight for weight the value of silver rupees. By the closing of the mints he was deprived of that, and his ornaments were depreciated in realisable value by about 30 per cent. My second point was that I thought too much stress was laid on the difficulties of the Government, and too little thought given to the interests and wishes of the people.

9035. (*Sir F. Mowatt.*) Do you distinguish the Government, acting for India, from the people themselves?—Well, I think the Government distinguished themselves as something separate from the people, and that I thought wrong.

9036. When you say that too much stress was laid on the difficulties of the Government, is it that you consider that the Government need not have called for greater taxation?—I thought they looked too exclusively, upon the difficulties of the Budget, and not enough upon the effects of what they were going to do.

9037. It is not that you denied that there was great Government stress, but you say there were other considerations which outweighed it?—Yes. Then I expressed the view that, had exchange not fallen, great loss and suffering would have resulted from the depreciation which must have taken place in the rupee prices of commodities. I am strongly impressed with the feeling that the prosperous development during the period 1876 to 1896, would either not have taken place or would have been greatly retarded. I expressed the view that, while I had no doubt of the ability of the Government to raise exchange by the restriction of the supply, I was of opinion that this would involve risk of loss, or even disaster, in other directions. I alluded to the practical difficulty of procuring a gold reserve such as would make the gold standard effective, while still continuing to give a sufficient supply of silver currency, as in the cases of France and America, to which the then proposed scheme had been likened. I remarked that India was a country of seasons—that, while the value of money might sometimes rise in the active season to 12 or 15 per cent., it might fall to 1½ or 2 per cent. in the idle season. Under an automatic system the supply would adjust itself, but I failed to see how the Government, under an artificial system, could so regulate the quantity as to give a sufficiency at one season without causing an inconvenient redundancy at the other. No one, I thought, could estimate the amount of injury which might be caused to the trade during its active period by artificial scarcity. I referred to Portugal, about which I had some personal experience; the fall in exchange there having been greater than in India, although up to 1891 the currency was believed to be upon a good basis and so definitely fixed that contracts were made indifferently in "libras" or in milreis, in the belief that the two terms were synonymous, but yet there came a great and sudden collapse. Then I referred to native opinion. I was at that time in correspondence with Mr. Sorabjee Bengalee, C.I.E., a Parsee gentleman of conspicuous reputation for high ability and financial experience, one of the most highly regarded and thoroughly representative men of Western India. He expressed himself in the strongest terms against the policy of the proposed closure of the mint. Mr. Sorabjee has since died. Those are the points that I brought forward in 1892.

9038. And you remain of the same opinion?—I remain of the same opinion, and I think that subsequent events have justified the views expressed.

9039. Do you consider, therefore, that the mints of India should now be opened to silver again?—Yes, I think it must come to that.

9040. Would you contemplate that being done at once, or by gradual processes, such as we have had described in the evidence put before us?—I should like it to be done gradually, if it possibly could be so done. The chief point is the stringency of money; and if that could be relieved—if, for instance, when the Bengal Bank rate went up to 6 per cent., or above, the Government were to buy silver and issue rupees in moderate quantities, say, a crore at a time—that would relieve the stringency, and, by raising silver and reducing the value of the rupee, it might possibly in course of time bring about an approximation of the two, and then would come an opportunity to open the mints. I do not think there is any urgency, so long as the money market is kept relieved. That is my chief point. I doubt also if the full effects of the closing of the mints have yet had time to show themselves. I think the mischief is in the stringency of the money market, and, if that is relieved in some way or other, I think the question of opening the mints might possibly be left alone; it might be delayed, perhaps.

9041. And the test of the necessity would arise when the rate of discount rose very much?—The rate of discount.

9042. You said that you were sensible of the stress of the Government's difficulty in 1893. Do you consider that the same difficulty would attend them now; that is to say, that payment of their gold interest would necessitate either borrowing or an increase of taxation?—Undoubtedly, in the first instance, yes. I would look upon it, more or less, as temporary.

9043. You would consider that the growth of prosperity that would result from the opening of the mints would be such that the product of the present taxation would in fact increase?—That is my view; and for this reason: I think there is no loss to the country; there is a loss to the Government, but a gain in other quarters. It does not make any difference to the country, as a whole, what the rate of the rupee is.

9044. But still the country, as a whole, would have to find the money?—The country would not have to find any more.

9045. You think the Government could continue to pay an additional 8 or 10 crores, or its sterling equivalent, and yet the country would not suffer?—The country would not suffer, because the country would gain in other ways.

9046. Have you considered at all, or do you regard it as outside your evidence, what taxation would be possible in the meanwhile, or would you have recourse to borrowing?—I would avoid borrowing. I would rather tax than borrow. I think it would be a pity to borrow.

9047. Have you at all considered what taxes would, in your opinion, be necessary?—To begin with, I think, there would be a great saving in opium. If you raise the exchange on China, assuming that the China price remained the same, there would be a great jump in the rupee price of opium. That I calculate would give you something like 1½ crores.

9048. You look upon that as a permanent increase?—As a permanent increase, assuming the dollar price in China remained the same.

9049. And that the amount of the opium trade remained the same?—Assuming that, yes.

9050. Then you would recommend import and export duties?—I would recommend import duties because, I think, the trade would bear it.

9051. And export duties?—Export duties, I think, might be a necessity, although I do not like them.

9052. Imposing the two would hardly amount to an encouragement of trade?—If, as presumably would be the case, prices rose as exchange fell, then the produce would be able to bear the strain of taxation. There are objections of one kind or another to all taxes, but it is necessary to raise the revenue in some way. Prices presumably would rise.

9053. You assume that prices would rise, if exchange fell?—I think that is the natural inference.

9054. Then you allude to death duties?—I do not know whether that has ever been suggested or not;

Mr. D. Graham, C.I.E.

15 Nov. 1898.

but I know there has been a feeling in India that the wealthier classes escape taxation. Of course, I appreciate that it is a very difficult question, especially in view of the Hindu laws of inheritance.

9055. I understand you as only just indicating these points?—That is all.

9056. You would be of opinion that from these four sources the Government might raise the additional 8 to 10 crores of taxation required?—Yes There is another item I have jotted down, namely, the railway revenue. I think it would be quite fair for the Government to increase railway rates on the same ground I have mentioned, namely, that, if prices rose, commodities would be able to pay so much more for transport.

9057. You would not say that the rates are now fixed upon the basis which is thought likely to produce the largest revenue?—That is so; but, if prices rise, as I assume they would, commodities would be able to pay so much more.

9058. Then the whole of your argument rests on the assumption that opening the mints to silver would result in a considerable rise in prices?—I think so, yes, as well as on the belief that there can be no real advantage to India from the mere raising of the value of the rupee.

9059. Do you consider that the opening of the mints would have the effect of increasing stability of exchange?—I think it would now.

9060. Now, as distinguished from before 1893?—Yes. I think there were exceptional causes which broke down the price of silver, but I think those causes have now exhausted themselves. There was the demonetisation of silver in Germany, and there were the discoveries in America, the increase in the production of silver; and there has been a scare about silver all over the world which, I think, has been carried too far. If the mints were opened in India, I think it would be a signal for more confidence.

9061. More confidence in the future of silver?—In the future of silver; and I think there are great hopes for the future of silver. Africa is coming forward and China also, and, I think, there will be an immense consumption of silver in the future; and there are no exceptional causes, as far as we can see, to send it down.

9062. Would not a large production of silver have a tendency to lower the price?—No doubt. How far that would be so it is impossible to say.

9063. But does your argument assume that you have touched bottom with the fall of silver now?—That is my opinion.

9064. In speaking of the benefit to the trade of India generally of the free coinage of silver, would you say that the benefit was general, or that the benefit would be felt by particular classes?—I think it is general, for this reason: I think in a country like India you want a free and large and cheap and abundant currency, and I think you can only get that by an open mint.

9065. When you say "cheap" currency I am not sure that I follow you?—I mean ample. Of course it might be too cheap. I see there has been reference to it in the examination of previous witnesses. It was said: "If it was an advantage to India to have exchange at 1*s.* rather than 1*s.* 4*d.*, therefore it must be so much better to have it at 6*d.* or at 3*d.* or at 2*d.*—a *reductio ad absurdum*." Of course there is a limit; there is a limit of suitability. I say when the rupee gets below a certain point it would be unsuitable; but so far as we can see there is no possibility of that.

9066. Can you indicate, roughly, at what price you consider it would be unsuitable?—It is impossible to say exactly, but as long as it is a fair standard of value, suitable for the wants of the people of India, it would be all right. I think the people themselves are the only judges of the point at which it would cease to be suitable.

9067. I am not quite sure that I follow you even now. Roughly, should you contemplate the possibility of a fall below 10*d.* rendering it unsuitable?—I would not say below 10*d.* I think that would still be suitable, but it would gradually get less and less suitable, if it got much below that; if, to take an extreme example, it became like copper, it would be too bulky to be suitable. The people of India themselves are the only judges of the point at which it would cease to be suitable.

9068. You consider, I think, that the real necessity for the opening of the mints is to prevent the very high rates and the stringency?—Yes, that is my opinion.

9069. Now, taking the extreme stringency that we have had before us this last year, you were present when Mr. Le Marchant was examining the previous witness as to the causes other than the mere contraction of currency which affected that?—Yes.

9070. Without taking you through all the causes that were put forward, do you appreciate that the other causes had that effect?—Yes, I concur in that view that they must have had some effect.

9071. A comparison between the rates charged in India with those charged in England, would not be quite a fair comparison, would it, because the normal rate is lower in England than it is in India?—Yes, I agree in that.

9072. Do you hold that the stringency was general through the internal trade in India, or was it limited to particular localities?—I can only speak of my own knowledge for the Presidency towns. I know it has been said that it was not felt so much in the districts. I cannot speak as to that.

9073. As regards the Presidency towns, it was generally felt?—Yes, very severely.

9074. Does it coincide with your own experience that the native bankers were at that time lending money considerably below the bank rate?—I have no knowledge of that.

9075. I see it is stated that one of the native bankers was lending at 6¾ per cent., while the Presidency Banks were charging 10 per cent.?—Yes; that did not come within my experience. I can hardly understand it, there must be some explanation.

9076. The explanation was that they had not a fixed rate, but that it depended entirely on the security and the shortness of the loan?—Of course the period of the loan would make a great difference.

9077. On the whole, assuming the mints are not opened next year, should you foretell as great a stringency?—I think it is quite possible not. Everyone seems to expect it, and very often, when that is the case, everyone makes such ample provision that it is guarded against. That might happen this year.

9078. That rather suggests the idea that provision can be made to prevent stringency?—Well, to a certain extent, not altogether.

9079. Just in the same way as a famine foreseen is a famine provided against?—Yes.

9080. You have heard the previous witness say that, since the fall of silver began, prices in India have risen very much?—Well, I have tried to get at the prices, but they are all governed by so many different circumstances that I found it impossible to draw any real inference.

9081. I will not take you through the figures, with which I have no doubt you are familiar, but, as a general impression on your mind, should you say that they have risen?—If you take any particular article and examine it, you find there a number of causes which affected it. I have found it impossible to draw any definite conclusion.

9082. But upon the whole you would not consider that the prices have generally risen materially?—I do not think so. The prices of imports and exports at the Presidency towns I do not think have altered much. I have compared the prices given in the Bombay Chamber of Commerce reports for 1877 and 1897, and I find them almost identical.

9083. I was thinking more of the ordinary prices of the food stuffs of the people?—I have tried to get at that, and I have found myself unable to draw any definite inference.

9084. Without taking you through the reasons—because, if you entertain the opinion, the reasons are pretty clear—you say that a falling exchange as opposed to a fluctuating exchange stimulates exports?—Yes, undoubtedly, I think so.

9085. And you hold that the limit of the fall of the rupee, at which that ceases to be true, is what you have already indicated, viz:—the suitability of it?—Yes.

9086. Are you familiar with the China trade?—No, not at all.

9087. Or the output of the Indian cotton mills?—I have no special information beyond what is open everyone.

9088. Is it one of the grounds of your feeling in favour of the opening of the mints, that prices are, as a fact, steadier in silver countries than elsewhere?—I think they have been practically steady in India.

9089. I do not know whether your objections to a gold standard in India are on the ground of its impossibility or on the ground that it would not serve any good purpose?—Both.

9090. The impossibility depending on the amount of the reserve fund which would be necessary?—That is one reason.

9091. Do you consider that that fund must be larger than the amount indicated by those who take the Government view?—I think it is almost impossible to say what would be necessary, until it is actually tried.

9092. In saying that, do you refer to the possibility of increased hoarding?—There again, also, we do not know at all what would happen in the way of hoarding.

9093. Have you formed any idea of the amount of the reserve fund which would be necessary?—Well, Sir John Muir asked the last witness if 50 millions would be about it. I should put it at something like that, but it is a mere guess. That is the kind of feeling I have in my mind.

9094. I think we have gone over the ground pretty well with the previous witness. Have you any other observations you would like to make?—There are one or two notes that I have made. I noticed in Sir Edgar Vincent's evidence, he recommended that instead of Council drafts it would be better if the Government altered the system altogether and purchased bills in India. I think the Committee should consider very carefully before adopting that recommendation. It was tried once before about 20 or 25 years ago. The Government bought some bills in Calcutta and it created something like a panic in the market. The Bombay Chamber of Commerce took the matter up at the time and expressed a strong feeling about the mischief that had been caused by it; and they passed a resolution, which was sent to the Government, to the effect that, considering the enormous influence which the Government remittances had on the exchange market, the proper thing was to fix the general policy at the beginning of the year, and to adhere to it, unless for some very special reasons, very much as it is now. Then I have a note here about the China trade. Sir James Mackay gave statistics of the exports of raw cotton and cotton yarn to the Far East, but he omitted to give the exports of cloth, which is a very material point. I think that ought to have been given, because it alters the argument very much. His point was that there had been no falling off; that there had been rather an increase in trade with China in cotton and cotton yarns; but, if he had given the yardage of cloth, it would have told a very different story.

9095. (*Sir A. Dent.*) That is a very small item, is it not?—I have the figures here.

9096–7. (*Sir F. Mowatt.*) Do you say it affected his total?—No, it affected his argument.

9098. Will you give us the figures, and we can see how far it affected his argument?—There was a steady increase up to 1895–96.

9099. Will you give us the exact figures?—92,662,327 yards in 1895–96.

9100. From India or from Bombay?—This is from the whole of India to the Far East. It is corresponding with the figures that Sir James Mackay gives. In 1896–97 it fell off to 74,577,344 yards. In 1897–98 it fell to 62,251,715 yards—a falling off which has still been going on.

9101. (*Mr. Campbell.*) The value is very small comparatively, is it not?—The value was Rs. 1,49,89,631 in 1895–96, and it fell off to Rs. 1,06,48,893 in 1897–98. This is to all countries; it is mostly to China and Japan.

9102. (*Sir A. Dent.*) And it is all grey cotton?—All grey cotton.

9103. Unbleached?—So I understand. Then there is another correction which is a very important one—the quantity of silver coin in the country. In Mr. Harrison's evidence he gives it as 120 crores.

9104. (*Sir F. Mowatt.*) You mean circulating?—That is his estimate of the current coin in India. In his previous examination in 1892 his evidence, based on a similar calculation, brought out a very different result—that there were 166½ crores in active circulation and 50 crores in hoards. That is in the Herschell Blue Book, page 308.

9105. I do not think that the total 120 crores that he mentioned in his evidence the other day included hoards; that was the active circulation?—Yes.

9106. Still the comparison is between 166½ crores and 120 crores?—Yes. I do not know whether there is any explanation, but it shows the difficulty of ascertaining what the amount of existing currency really is, and it is a very, very important point, in connexion with any scheme involving convertibility.

9107. (*Sir J. Muir.*) It is a large divergence?—Yes. Then there is another point. There is a great deal said in the evidence about the speculation that was caused by a fluctuating exchange before the mints were closed. I would like to say that my experience is not that at all. I think the movements in exchange gave rise to the present system of covering or securing exchange, both in the import and export trade.

9108. (*Sir F. Mowatt.*) You think it rather checked speculation?—Yes, it rather checked speculation. That is my experience.

9109. Both before and since the closing of the mints?—Yes; there is another point that I have referred to, namely, the difficulty of securing exchange on account of the uncertainty of the money market. Debts are not paid with the same promptitude as formerly, and it is almost impossible to calculate when money will be paid; and therefore it is very difficult to arrange about forward contracts.

9110. Was not that equally so before the closing of the mints?—No, because debts were paid so much more promptly and regularly. Then I notice that Mr. O'Conor referred to the gold movements for the last five years. He said the large gold exports had been caused by the famine. There is a mistake there, because the large gold exports were made in 1894–95—before the famine. I think the explanation about the gold movements is the sudden rises or falls of exchange. When there is a sudden fall of exchange, there is a natural tendency to export gold. Before the bazaar price of gold responds to the fall, it becomes very suitable as a means of remittance. That has always been the case. When there has been a sudden fall of exchange, there has been an increased export of gold.

9111. It means a rise in the price of gold?—A rise in the price of gold, but the price does not respond just at once, and therefore it becomes profitable as a remittance.

9112. (*Sir J. Muir.*) You have given us your views as to the means by which the Government of India might increase revenue if they were so disposed?—Yes.

9113. You referred to opium, and you referred to import duties?—Yes.

9114. You mentioned that in 1897 the import duties amounted to 3¾ crores, and you think that by doubling the rates an increase of 3¾ crores might be secured?—Yes, I think so.

Mr. D. Graham, C.I.E.

15 Nov. 1898.

9115. You are yourself a senior partner in one of the largest, if not the largest, import houses of Manchester goods into India, Ralli's running a very close race with you. You should be able to form a pretty accurate idea as to that, and as to the effects it would have on your own business. I take it, you do not see any difficulty, in so far as your own business is concerned, in the rates of import duties being doubled?—No, I think it is a lesser evil than to have a stringent money market.

9116. You agree with me that it is the great duty of those who desire the prosperity of India to do all they can to increase her export business?—I think so, undoubtedly.

9117. We have had witnesses who took another view, such as Sir James Mackay and Mr. Allan Arthur, in whose views I do not think you concur?—Not altogether, no.

9118. Then, as regards export duties, you are of opinion, I gather, that the export of jute might be fairly taxed, and also an export duty might be put upon tea, provided the 1*s.* 4*d.* rate were discontinued, which is a severe tax itself upon tea?—That is my view, especially as it has come out in the evidence that tea pays an export duty in China.

9119. You would, then, see no difficulty in an export duty of, say, 10 per cent. on tea and jute, which would bring in an income of 2 or 2½ crores?—Yes.

9120. In point of fact your view coincides with that of a great many of the merchants of India—merchants in Calcutta, Bombay, Madras, Karachi, and elsewhere, who think that the Government raise difficulties unnecessarily with regard to what they think the great difficulty of increasing the revenue from taxation and from further duties?—Yes, that is my view.

9121. And that view is held by a very large number of the merchant classes throughout India?—Yes.

9122. In fact, the Government seems to have made up its mind that, in order to square its Budget, the great thing is the 1*s.* 4*d.* rate, irrespective of the disasters it would bring on the mercantile classes in India?—Yes, that is so.

9123. Then you bring in here the death duties. I believe you have given to that subject some little consideration, and, personally, I should give a good deal of weight to your opinion upon the matter?—I explained to Sir Francis Mowatt that it was merely a suggestion. I know there are great difficulties in consequence of the Hindu law of inheritance, and there are other questions which make it a very serious matter, but I had not noticed that it had been referred to at all in the evidence so far given to the Committee, and I just mentioned it.

9124. You are aware also, are you not, that there is a feeling that the wealthy natives of India escape the taxation that they ought to bear?—Yes.

9125. And there is a feeling of injustice abroad in India with regard to that?—Yes, a feeling that they might fairly contribute more than at present.

9126. In point of fact, you think that, if it is a fair and just thing in this country to exact death duties, it might be just to apply the same thing in India?—I think, if there were not local difficulties, it would be just; and that, without pressing at all on the poor people unduly, a large revenue might be procured from the wealthy people who are now escaping taxation. I think that is a subject that ought to be fully considered.

9127. Then, as regards railway rates; if the country becomes more prosperous than at present, and there is a large population moving backwards and forwards with more money in their pockets, they can afford to pay higher rates for railway accommodation?—Yes.

9128. (*Sir F. Mowatt.*) Do you regard it as right that the rates and fares on the railways should be altered according to the means of those who use the railways or fixed with reference to the necessary cost of the traffic?—Well, both will have to be considered.

9129. I should like to understand whether Sir John suggests, and you accept, the view that, as the poor people may have money in their pockets, and are able to travel more, the rates of the railways should be put up?—I was not thinking of passenger rates; I was thinking of traffic rates. If prices rise, commodities can afford to pay more for cost of transport.

9130. (*Sir J. Muir.*) You were glancing at the rates charged by banks when making advances, and as to what might perhaps happen in the busy shipping season; are you aware that severe strictures have been passed on the Government for tying the rupees, and not allowing the banks of Bengal and Madras and Bombay to have the use of those rupees?—You mean in the Treasury balances. I think something ought to be done in that way.

9131. It has been a severe complaint, especially in the last year, when the rate went up to 10 per cent. in Bombay, Calcutta, and Madras, and 13 per cent. in other places, and when, with all that, money could not be obtained in Bombay even at 18 per cent. Do you think it would be well if some arrangement could be made for the Treasury to let free some of the rupees that are kept tied up irrespective of the loss and difficulty that are entailed on the merchants and people of the country?—I hope that, now the subject has been referred to, some arrangement may be made. I have been hoping that.

9132. You are aware that there has been a great feeling of discontent created throughout India by the Government policy last season?—I know it has been commented upon.

9133. Then, I see that you make special reference to the figures produced by Mr. O'Conor, which you think convey a misleading impression with regard to the Manchester goods trade. Will you kindly explain wherein you think Mr. O'Conor was wrong?—The comparison was given, naturally enough, perhaps, for 10 years, 1886–87 to 1896–97; but the year 1886–87 was rather a misleading one to take, because it happens it was a year of great activity itself; there was a sudden increase in that year. It was 5 crores more than any previous year. Therefore, the comparison of it with those following it would create a wrong impression. As a matter of fact the increase over the whole period has been very steady and continuous.

9134. Will you state the figures?—A more accurate idea, perhaps, is given, if you commence from 1876–77, which was the year of the first great fall in silver. The yardage in the year 1876–77 was 1,187 millions; in 1893–94, the year the mints were closed, the yardage was 2,130 millions. Similarly, cotton yarn increased from 33¼ to 42¾ million lbs., and that is in spite of the great competition of the local mills which, as the previous witness has shown, has taken away the whole trade in coarser cloths and yarns from Lancashire. As a matter of fact, the trade has steadily been increasing all through, and therefore it is a mistake to suppose, as implied by the figures from 1886–87 to 1896–97, that it was only stationary.

9135. Do I understand that you estimate that 232 millions of yards of these cloths have been lost to Manchester?—That is my calculation.

9136. Under the old *régime*, do I understand you to say that merchants, conducting such businesses as Ralli's and yourselves, had no difficulty whatever so far as exchange was concerned, because you knew the price at which to buy the goods in Manchester, you knew the price at which you could sell in Calcutta, and you could fix exchange forward?—Yes, that was done through the exchange banks.

9137. And there was no difficulty in conducting business in that way?—No, not at all.

9138. (*Sir F. Mowatt.*) It is now more difficult to fix the exchange forward?—Yes, on account of the difficulty of calculating when you will be paid your debts.

9139. Do the banks demand a higher rate?—No. I mean that, on account of the uncertainty in the money market, you cannot rely on getting your debts paid. Much larger credit has to be given now.

9140. (*Sir J. Muir.*) It is more difficult now to recover debts, and larger and longer credits have to be given by the bunneahs?—Yes.

9141. And all that tends to make business more difficult?—Yes.

9142. And there are greater risks?—There is greater uncertainty. As a matter of fact, the outstanding accounts of my firm, which used to form 16 to 18 per cent. of the total business, have latterly increased to over 30 per cent. Of course, the plague and famine have had something to do with that. I would not say it was all owing to the stringency of money, but that is the chief cause.

9143. And the same rules which are disadvantageous to your business affect other houses with a similar business?—I presume so.

9144. (*Sir C. Crosthwaite.*) You blame the Government for distinguishing between what you think were Government interests and the interests of the whole country?—Yes.

9145. Do you think that a Government which takes a certain course in order to avoid the necessity of putting more onerous and difficult taxation on the country can be justly blamed in that way?—But that is my point, that there would be no increase of taxation on the country as a whole.

9146. You think not?—I think not. The debts are paid in produce at the gold value, and therefore it makes no difference.

9147. Quite so, for India as a whole, I admit. Your principle is that the rupee is a mere medium, that the real exchange is an exchange between Indian produce and European produce?—Exactly.

9148. And that, therefore, the real question is the sterling price of Indian produce?—Yes.

9149. And you think that, if the mints are reopened, the deficit that will follow, owing to the greater number of rupees which Government will have to find in order to pay the home charges can easily be met by increased taxation on the country?—I think it can be met. I will not say easily, because I quite realise that there will be difficulties; but it can be met, and my point is that that is a lesser evil than that of forcing exchange by artificial scarcity.

9150. You also think that a fall in exchange will stimulate the exports?—Undoubtedly.

9151. That is to say, there will be more exported from India?—Yes, there will be a stimulus to production and more exports.

9152. I suppose you admit that to export more from India merely, in itself, is not necessarily a good thing?—Oh, yes; I look upon a country as like a great manufactory. Its first charges are its own requirements and ——

9153. For instance, if 1,000 tons of wheat are exported from India now and fetch 1,000*l.*, it will be better for India under open mints to export 2,000 tons for 1,000*l.*?—Yes.*

9154. The mere fact of increasing the quantity, irrespective of the price obtained, is good, you say?—Yes, I say it is good because it increases production and gives employment to the people.

9155. Would you apply that to any private individual—that if he can sell a ton of any article for 1*l.*, it is better for him to sell 2 tons for 1*l.*?—There are fixed charges, and the on-cost. Up to that point there is no profit. The profit begins after that. As you increase the quantity, the advantage goes on in an increasing ratio.

9156. But can you apply that to the agricultural products of a country which is worked in small tenures?—Yes, most certainly.

9157. The more they pay out, the better, no matter what they get; the more they export the better, no matter what they get?—Well, of course there is a limit to that.

9158. That is what it comes to—the more they export, no matter what the price is, the better for them?—No, I would not say that.

9159. Therefore it is a question of sterling price?—Sterling price, undoubtedly.

9160. If you stimulate production in this way by opening the mints and having cheap silver, will you, or will you not, lower the price; is not the effect to lower the sterling price if you pour quantities of Indian produce on the market?—I do not think so. It may have a small effect. It is a question of supply and demand. If the supply is in excess of the demand, then the price is forced back on the cost of production, but, if the demand is equal to the supply, or in excess of it, then the price is governed accordingly. In such great articles of Indian produce as wheat and cotton, they are influenced by other circumstances altogether. To a slight extent possibly the quantity from India may affect the price, but it can only be a small per-centage.

9161. Then in what way does low exchange stimulate the exports?—Because the cultivator, instead of selling his produce for 12 rupees, gets 13 or 14 rupees.

9162. He gets more rupees?—He gets more rupees, and he is able to cultivate more. He is encouraged to take in more land and to put it under cultivation.

9163. Then you think he does get more rupees?—Yes.

9164. You think that prices in India do rise?—They must rise, if exchange falls. Cotton, for instance, must rise at the port, and that must reflect itself sooner or later on the grower.

9165. But I understand you to say that silver prices in India do remain pretty steady?—They have done, because there has been a considerable fall in gold prices.

9166. If silver prices in India have remained steady, then the cultivator cannot be said to have had more rupees?—Well, taking it in that way; but on the other hand, if exchange had not fallen, if silver had remained at its old level, he would have had to accept fewer rupees.

9167. He might have got less rupees?—He might have got less rupees, and he would have suffered very much.

9168. Then you say, never mind about the taxation, because the country will get so many more rupees; but what certainty have we that the country will get any more rupees? All that has happened hitherto, according to your own statement, is that the cultivator has not got as many less rupees as he would probably have done if the fall of silver had not for him counteracted the fall in sterling price?—I think the answer to that is that there has been a great fall in the sterling price of commodities, and—that being so—it is certain that, if silver had remained at its old level and the rupee at 1*s.* 10*d.*, there must have been a corresponding fall in rupee prices. The general impression now is, however, that we have got to the bottom.

9169. Then we are to take a great step, on the "general impression" that we have got to the bottom?—Yes.

9170. And, if rupee prices do not rise as you anticipate, and the Government of India has opened the mints, what will be the condition of that Government, where is this extra taxation to come from?—Again the answer to that is that, if prices did not rise with open mints and a lower rupee, it would be because gold prices had continued to fall; and, were such to be the case, then with closed mints you would have a corresponding fall in rupee prices,

* *Note by Witness.*—This answer requires explanation. I do not seem to have followed the exact meaning of the question. The idea that open mints would so affect sterling prices is one to which I am opposed, and in my reply I was thinking only of the advantage a country must have in finding a market for its surplus produce. The circumstances which could have brought about such changes in values must have been accompanied by so many other changes of an economic kind that it would have been impossible to reply directly to the abstract question as I now read it.—D. G.

Mr. D. Graham, C.I.E,

15 Nov. 1898.

and great suffering in consequence. It is as broad as it is long, depending upon sterling prices.

9171. Suppose India, in reopening the mints, does pour a quantity of produce upon the London market, the tendency will be to lower the prices?—I do not take that view. Of course, it is a disputed question.

9172. Many of the witnesses we have had have stated that the first effect of a fall of exchange is to lower the sterling price?—I do not take that view myself. Of course it is a matter of argument.

9173. It is not so certain after all?—No. Of course everyone is entitled to his own opinion, and I know that views differ. In some few articles, in which Indian production governed the sterling price, it would no doubt have some effect, but only, I think, if supply exceeded demand.

9174. Then there is another point which bears upon that, and it is a question which I asked a former witness. We have had experience now for years of a falling rupee, and we have not found that the revenue rises to meet the deficit. You are aware that the Government of India has had to put a good deal of taxation on the country since 1884?—I think there was an error about that. It is all given at page 271 of the Herschell Blue Book.

9175. Since 1884, taxation has been increased?—Since 1884, until the closing of the mints in 1893, there have been three crores of taxation. I think you are including the cotton duties, which were imposed subsequently.

9176. I am taking it up to the present time?—But that was after the mints were closed and the cotton duties were reimposed. It was just the reimposition of what was remitted in 1882. Taking the whole period, from 1873 to 1893, there were increases amounting to Rs. 4,15,40,000 and remissions amounting to Rs. 4,57,40,000.

9177. Including those duties, there were 4½ crores added to the taxation since 1884?—Rs. 2,94,00,000 up to 1891. Then there was subsequent taxation—the cotton duties were reimposed in 1894.

9178. Also, taking the surpluses and the deficits for the 25 years from 1873 to 1898, the Government has had a net deficit of Rx. 2,398,088?—Of course, it depends very much on the dates. At each fall of exchange there has been a heavy deficit.

9179. But, taking the 20 years together during which we have had this fall of exchange, we have ended with a deficit. There is a net deficit over 20 years of over Rx. 2¼ millions?—Yes, that appears to be so. As I say, at each fall of exchange there was great difficulty and a deficit, but, as trade responded, things revived and there was a great surplus. There was a deficit in 1876–77, which was the first great fall of exchange. Then there were two more bad years, and there was a deficit of Rx. 2½ millions and 4¼ millions roughly.

9180. But, taking the whole 20 years and deducting the surpluses from the deficits, there remains a net deficit?—I do not think it is fair to take the whole 20 years—you should take the different periods. The first great fall of exchange was in 1876–77. Then there were some very bad years, but when the trade responded there were great surpluses. Not only trade responded, but revenue increased, and there was a great remission of taxation in 1882–83. Here are the figures: In 1882–83 there was Rx. 1,219,000 of cotton duties abolished; the salt duty was reduced by Rx. 1,400,000, and there were other small sums.

9181. There was a great remission of taxation in 1884?—There was a net remission of taxation of 2¼ crores. Then taking the different periods, there was that first great fall of 1876; and, as I point out, the trade at once began to respond. There was a very large increase in it, and also in the revenue. In 1880 to 1884 the revenues were very prosperous; so much so that it is dwelt upon in the Budget of 1882–83 as a great period of prosperity for the country. Then came another fall in exchange in 1885–86, and there were three bad years. Then the country responded again, the trade rapidly increased and with it the revenues, and in 1889, 1890, 1891, and 1892 there were large surpluses. Then came another period of depression, and that was met by the closing of the mints. My contention is that it is a fair inference that, if things had been left to right themselves as before, there would again have been an adjusting increase of trade and of revenue.

9182. Then there was an extra tax put on in the interim?—Yes; the salt duty was raised again, and the income tax was put on; that was Rx. 2,800,000.

9183. Then the *quasi*-local taxation that had been remitted in the North-West Provinces was put on again?—Yes, the patwari tax, Rx. 250,000.

9184. But my point was simply this, that during all that time this influence, which is said to be beneficial, was going on, the rupee was falling more or less steadily, and yet at the end of the time, in 1892, you see that the Government were face to face with the great difficulties with which you say you sympathise?—Oh yes, I sympathise with them, but my point is this, that the country does not respond straight off at once; it takes a year or two, or three perhaps; therefore I hold the view I have stated, and it is illustrated by these previous cases, where, if you allow a year to elapse, the country will respond and the revenues increase.

9185. Without taxation or with taxation?—Without taxation. As a matter of fact in 1882–83 there was taxation remitted, notwithstanding the enormous amount (which is also given in the Herschell Blue Book) paid for the Afghan war.

9186. But taxation was reimposed, and additional taxation added?—Not at that period.

9187. Not at that period, but since that, while the rupee has continued to fall, the Government have been compelled to reimpose the old taxation and to impose additional taxation?—Yes, but I say the country has not had time to respond to that. There was an increase of 2¾ crores in 1886–89, but in the three years following that there was no less than 6½ crores of surplus.

9188. What happened after that?—Then there was a fall again, and there was a big deficit, and that is what led to the closing of the mints, and the whole position was then changed.

9189. You say the country has not had time to recover even from that last fall?—I say everything has been checked. I quite admit plague and famine have had an important influence; but I say, more than anything else, the stringency of money has interfered with the progress of the country. That is my experience. I am strongly convinced of that.

9190. Anyhow, notwithstanding those figures, you maintain that a falling rupee will enable the country to meet any extra taxation that will have to be imposed?—Yes, it does not make any difference; it is taking from one pocket and putting into another. The Government save, but at the expense of the country, but it does not do any good to fix the rupee; you could not make the country rich by raising the internal value of the rupee.

9191. You say it makes no difference to the country as a whole whether the rupee is at 1*s.* 4*d.* or 1*s.*?—No.

9192. Then how is the country, as a whole, better able to pay the increased taxation, which the 1*s.* rate would necessitate?—Because the cultivation and produce are so enormously stimulated. If the people get more for their produce, they grow more.

9193. I thought your principle was that they got no more for their produce—that it did not matter to them what the exchange was?—They get more in rupees, which is what they look at. I say the great thing is to give them rupees, and to encourage the production of the country. As Mr. O'Conor says, there are 100 million acres of culturable waste land. Is it not the duty of the Government, seeing that the population is increasing at the rate of 3,000,000 a year, to do everything that is possible to stimulate the productive power of the country, and so to give food and employment to the rapidly-growing population?

9194. Then, whatever they gain on the exports in rupees, I suppose you admit that they would have to lose on the imports?—Yes, I admit that, and I am a sufferer myself; but it is only temporary. I am constantly asked how I, who am an importer of piece goods, take up this line. I say it is not a matter of imports and exports; it is a matter of the welfare of the country; and therefore if an exporter gains by stimulated production, I, as an importer, if I do not gain directly, will gain afterwards by the increased prosperity of the country.

9195. (*Sir F. Mowatt.*) Generally, I think, it has emerged from this conversation that you hold that the greater the number of rupees that pass through India, the greater is the benefit to the country?—Yes, that is what it comes to.

9196. (*Sir C. Crosthwaite.*) Irrespective of the value of the rupee?—Irrespective of the value of the rupee. Of course there is a limit, as I said, as long as the suitability is maintained.

9197. You think there has been a great contraction of the currency?—There has been a contraction felt; there has been no actual contraction, because no rupees have been taken off, but there has been a constant dispersal, and that has been felt; the wants of the country are always increasing; and, if no increase of currency is given, it is practically contraction.

9198. Has that shown itself in prices? It ought to show itself, I suppose, in the lowering of rupee prices in India?—Yes.

9199. Have prices fallen in response to it?—It is said not; but perhaps it is too soon to judge.

9200. Take the ornament matter. There is a case where the price of silver in rupees has fallen?—Yes.

9201. But do you think the prices of any other commodities have fallen in consequence of the restriction of the currency?—I was saying that I had great difficulty in following prices; there are so many different circumstances that affect them.

9202. *Primâ facie*, we might presume that the price of other commodities has also fallen if we could trace it?—Yes.

9203. But they are affected by many other causes?—They are affected by many other causes.

9204. If that is so, is it right to say that a wrong has been done to the people of India by closing the mints, in respect of their ornaments?—I think so.

9205. Suppose a man could have got 2 rupees for his silver ornaments before, and now he gets only 1 rupee 8 annas, or 1½ rupees say, yet that 1½ rupees is worth as much perhaps to buy food and other commodities as his 2 rupees were before?—Well, you cannot tell that. He ought to have the 2 rupees, because he was led to believe that the rupee and silver were synonymous terms—weight for weight.

9206. That is to say, he has been accustomed to think so?—He has been entitled to believe so.

9207. That would not apply to any gold that he had saved or hoarded?—No, because gold is a marketable commodity; that is different, you can scarcely compare silver with ordinary commodities.

9208. Still he would lose on his gold just in the same way?—He might or might not. That is a different thing. He would know, if he bought gold, that he might lose or gain, because gold is a commodity.

9209. I suppose you would admit that of the people's savings there is more saved in coined rupees than there is in uncoined silver?—You mean in ornaments?

9210. I am taking the people of India generally. There is more money saved in coined silver, in rupees, than in uncoined ornaments?—I have no information on that subject.

9211. We were told so, I think, by Sir Antony McDonnell?—He would be a good authority upon that.

9212. (*Sir F. Mowatt.*) He put it, I think, at about two rupees for one rupee's worth of ornaments?—I have no knowledge of it myself.

9213. (*Sir C. Crosthwaite.*) If that is the case, if the savings in rupees are larger than the savings in uncoined ornaments ——?—To that extent, my criticism would not apply.

9214. The mass of people have gained on their savings, supposing that to be true?—Supposing that is the case, that is true.

9215. And if you reopened the mints, and you dropped the rupee down below what it ever has been, you hit all those people who have saved rupees?—I suppose you do. They would lose the advantage of the artificial value given to the rupee.

9216. So that it does not seem to me that there is more to be said on the one side than on the other, with regard to hoardings and savings?—Well, of course, there are both sides to be considered.*

9217. As to the prices of food, you say you do not know whether they have risen?—No, I have tried to examine the question of prices, but I have not been able to find that out.

9218. (*Sir A. Dent.*) You were saying that, if the mints were reopened in India, there would be an immense consumption of silver, and that would probably be added to in the course of time by a large consumption in Africa and China?—Yes.

9219. Then you say also that silver has about touched bottom?—That is the impression that I have, judging by the state of the market for the last few years.

9220. Do you think the amount of silver can be largely increased?—No doubt it would to some extent.

9221. If that can only be increased to a moderate extent, will not the price of silver be materially forced up in the next few years?—I think it very likely will.

9222. Then on the other hand we have an increasing production of gold?—Yes.

9223. It has increased enormously in the last 15 years?—Yes.

9224. And we know that that gold is absorbed by Russia, Germany, and Japan and other countries?—Yes.

9225. That absorption will cease, no doubt, at some time. All these new supplies of gold will be pressing on the market?—Yes.

9226. Do you not think we shall then have a much higher ratio between gold and silver than we have at present?—I think that is quite possible and even probable.

9227. Do you not think that this question may settle itself in the course of time?—Yes, and I have said that, as long as we keep the money market steady, the thing may be allowed to drift; the money stringency is the only thing that I think is urgent.

9228. I suppose you would sooner see the Indian Government begin at 1*s.* and work upwards, than adopt their present principle of 1*s.* 4*d.* and work the markets up to that?—Yes, that is my view. I would rather see them go on some sound basis.

9229. It was suggested, (I think by your partner, Sir Frank Forbes Adam), that India should make overtures to America to try to get on a proper basis. Do you agree at all in that?—I think it would suit India. As far as I understand it, the proposal is that India should come under an obligation to keep the mints open for a certain limited period. I think that would suit India very well. I do not care about international agreements very much.

9230. That is the point; it would be very difficult for India to carry out any international agreement?—Very difficult, and I do not think France would come in. What I would be afraid of is that there would be a temptation to enter into negotiations with a view of getting a higher ratio. I think it would be a mistake

**Note by Witness.*—Mr. Harrison (page 308 of the Herschell Blue Book) estimated in 1893 that the silver in India amounted to 510 crores, including 300 crores in ornaments and bullion; 166½ crores of rupees in active circulation; and about 50 crores of rupees in hoards. If this is correct, then Sir Antony MacDonnell must be making a mistake.

Mr. D. Graham, C.I.E.

15 Nov. 1898.

for India to propose the negotiations. If an offer was made to India it might be accepted, but I object to her entering into negotiations which would only disturb the market and might never come to any result.

9231. As to your suggestions for additional taxation, one of them is with regard to opium. That would be a very precarious source of revenue, would it not? The trade is largely dying out on account of the large growth of opium in China?—I do not know anything about the trade. I merely take the figures of the trade as it is, and calculate the difference in exchange. Very likely you may be correct in that.

9232. Then you suggested doubling the import duties. Do you think that Manchester and Glasgow would agree to that?—I think there is a general acceptance of my view, so far as I have heard, and I am in a fair way of knowing.

9233. Then you consider that they have materially changed their views from those that, as we know, they held at one time?—I think one of the strong reasons against import duties at that time, was that the amount to be collected was small in comparison with the amount of trouble and annoyance that would be created. Of course, if the collections were doubled that argument would be in great measure met.

9234. You have made some remarks about the difficulties of buying exchange forward. Have you not found in your business for the last few months that it has been comparatively easy to fix exchange several months ahead?—That is very easy, but I refer to the difficulty owing to the uncertainty of payments. Credit, owing to the state of the money market, has had to be extended very much.

9235. I think we all find in business that exchange can now be settled many months ahead with much greater facility than it could a year ago?—Are you talking of India and China business?

9236. I am talking of the last four or five months as compared with two or three years ago?—No, I do not think so; for many years past there has not been any difficulty.

9237. (*Mr. Campbell.*) One question as to the effect of high or low exchange on prices. You stated that the effect of a falling exchange was to raise the rupee price?—Yes.

9238. I think Sir Charles Crosthwaite suggested that there might be an offset in a fall in the sterling price?—Yes.

9239. But would you consider that, in such articles as cotton, wheat, and hides, and large articles of export of that kind, India is not the only seller *to* European markets; she has to compete with the United States and other countries?—Yes.

9240. And she is really a comparatively small seller?—Just so.

9241. So that the Indian supply cannot regulate the sterling price?—No.

9242. An increase or decrease in Indian exports will have a very small effect?—That was the conclusion I came to.

9243. Then, again, you said there had been no actual contraction of circulation since the mints were closed?—So far as I know.

9244. But are you allowing for such influences as wear and tear and export?—Well, what I meant was that probably there would be no melting.

9245. There might be less melting, but can you say that there has been no melting?—No, I cannot say that.

9246. From ordinary causes, would you say that there had been no contraction?—There has been relative contraction as compared with the previous times, when there was constant automatic expansion.

9247. While, with the population increasing, as it is, one would naturally expect that they would require more?—Undoubtedly, yes.

9248. Sir Alfred Dent has asked you whether you approve of trying to come to arrangements with other Governments in regard to the opening of the mints. You said that you were adverse to negotiation?—Yes.

9249. Do you think that one great difficulty would be the question of fixing upon a ratio?—I think that would be the difficulty.

9250. And you also think that it would be inexpedient for India to tie her hands?—For any lengthened period. I think if we merely kept the mints open at 22 to 1 for 10 years, that would be a mere nothing.

9251. You could not recede from it once you had agreed to it?—I do not suppose India would wish to recede from it, but, if she was only bound for 10 years, her independence would not be materially compromised.

9252. Then you suggested that, with the view to the gradual resumption of free coinage, the Government might, in the first instance, coin as occasion required?—Yes.

9253. Would not that be a questionable power to confer on the Government?—Yes, it would, but I propose it as a temporary measure—as an expedient—to let the exchange fall gradually.

9254. Would you consider that a proper power to put into the hands of Government?—Well, there are objections to it, but I think for a temporary purpose it would not be objectionable.

9255. Government's interest, of course, would be to maintain exchange for the sake of their council bills?—My suggestion was that it should be guided by the Bank of Bengal rate. If the Bank of Bengal rate went up above 6 per cent., or whatever it was, they should issue rupees and relieve the money market.

9256. Would not that be to transfer the power of regulating the currency into the hands of the Bank of Bengal?—I see that. It is a matter that must be carefully considered, and perhaps I have not sufficiently carefully considered it.

9257. The Bank of Bengal's interest might clash with the public interest?—Yes.

9258. It might be their interest to refrain from putting the rate above 6 per cent., and they might refrain from doing it?—That is a very strong point undoubtedly, but they could not long resist the course of the market, or their reserves would be drawn away from them.

9259. Then, again, there is another point in connexion with that; you cannot eliminate the Government's power of control altogether, because the Government have it in their power to manipulate the money market of Calcutta by means of withdrawing or lodging their Treasury money with the Presidency banks?—Yes.

9260. So that, if they found it to their interests either to coin or not to coin, they might be under the temptation of manipulating their balances at the Presidency banks with that view?—That might be so. They would have conflicting interests, on the one hand to make the profit on coinage, and on the other to support the rupee by restriction; but I should hope that they would aim at doing what was really best for the country.

9261. Do you object to a gold standard altogether?—I object to a gold standard altogether, because I think it is impracticable. It depends upon what kind of gold standard you mean. If it could be made effective and convertible without expense, I would not object to it, but I do not see how it can be done. I would not object if it could be done economically and safely and effectively.

9262. Is the present ratio of 1*s.* 4*d.* any part of your objection to the standard?—Well, it is a question of degree. If it was 1*s.* 2*d.*, it would be more easy to keep it.

9263. It would be nearer the real silver value?—Just so.

9264. And, according to your view, the lower rate would help to maintain the favourable trade balance on which Government depends for payment of its obligations?—That is so.

9265. And to whatever extent the ratio approached nearer to silver, the evils from the present system

would, in your opinion, be mitigated?—Yes, provided the money market was relieved.

9266. That is, a standard established which would promote the flow of gold into India for currency purposes?—Yes; it would have a better chance of doing so.

9267. At present the rate of 15 rupees to the sovereign has not brought in gold at all?—No, because the sovereign has a greater value in the market.

9268. And the question would be whether 16 or 17 rupees would induce people to send gold to the Currency Department, where they will not send it at 15 rupees?—Yes.

9269. Now there was a question that I asked Mr. Cheetham, whether, considering that 80 per cent. of India's trade is with gold-using countries, there would not be certain advantages in having a gold standard on that ground. What do you say to that?—I think there would be certain advantages, but I do not think it matters much. As long as there are no violent fluctuations, I think the trade accommodates itself to gold or silver; so I do not think it matters very much.

9270. If both England and India were on a gold standard, the trade balances could be much more readily adjusted than now?—Yes.

9271. And an adverse trade balance could be adjusted by a shipment of gold home in that case?—Certainly that would be an advantage.

9272. While at present, or with a silver standard, it can only be adjusted at the cost of a heavy fall of exchange or the temptation to increased sterling borrowing?—Yes; if there were not the great practical difficulties to get over, it would certainly be an advantage to adjust trade balances in gold.

9273. India could not adjust her trade balance very well by shipping home silver to Europe, because the loss in exporting silver and selling it in Europe would be so great?—She could not ship it to Europe, she could ship it to Eastern countries, and under open mints she thus exported not only silver but rupees.

9274. You alluded to the trade of India being seasonal, requiring a large supply of currency at one time and involving a plethora at another?—That is one of the practical difficulties.

9275. And that, you say, may lead to a rate of interest of 12 per cent. at one period, while at another the rate may be as low as 1 or 2 per cent.?—Yes.

9276. Would not the gold standard obviate that, to some extent, at all events?—Yes, because you could transfer so much more easily.

9277. Then another advantage would be the stability of exchange?—Certainly, if you could establish an effective gold currency.

9278. Now, suppose a gold standard were thought to be desirable, the question would be as to finding the gold?—Yes.

9279. Would you approve of borrowing for that purpose?—I think it would be very objectionable.

9280. Borrowing ought to be avoided?—Borrowing ought to be avoided.

9281. You think any increase of sterling obligations ought to be avoided?—Any increase ought to be avoided; and I may say here it is one of the drawbacks to what has happened that the Government has had to borrow 6½ millions for the mere sake of supporting exchange. That has been one of the unfortunate results of closing the mints.

9282. Then, at a ratio which would not hamper or embarrass trade, do you see any difficulty in the way of India acquiring the necessary gold in return for her surplus exports, in the same way as she has hitherto acquired the necessary silver for the purposes of currency?—There would have to be some attraction for it.

9283. Suppose a lower ratio is given?—A lower ratio would attract it.

9284. You consider that a better mode than borrowing?—Oh, yes.

9285. And, of course, it would be a slower process?—Yes, and it could only be done if the trade balance was constantly favourable.

9286. Do you consider there would be any disadvantage in its being a little slower?—No, I do not think so.

9287. The gold, as it came out, would relieve the money markets—as it was passed into currency, it would relieve the money markets, would it not?—I do not see how the gold is to be got out.

9288. Supposing the mint price of gold is not lower than the market price, people shipping gold would send it to the currency department instead of selling in the bazaar?—Yes, that would depend on the bazaar price.

9289. But the question of ratio does come in?—Yes; if that were possible, it would certainly be a better way; the question of ratio is very material—the lower the ratio, the better the chance of attracting gold.

9290. I suppose you admit that that would postpone the question of convertibility until a sufficient supply of gold had been acquired?—Yes, it would. Borrowing would be a much quicker process, but would be very costly, and always with risk of eventual failure.

9291. (*Mr. Le Marchant.*) You were alluding to a remission of taxation in 1882. Was it not the fact that that followed a very considerable reduction in the Government expenditure on public works? Financial conditions were more favourable in consequence of diminished expenditure on public works and reduction of establishment?—That may be so. I had not noticed that.

9292. And subsequently the Government did not find it possible to continue so low a rate of expenditure?—I had not noticed that. I do not remember that.*

9293. I think you quoted a remark of Lord Cromer, in introducing the budget, alluding to the prosperity of that time?—Yes.

9294. Do you recollect that he subsequently, said that if he had foreseen the future, he would never have reduced taxation?—I had not heard of that.

9295. Did not England give India 5 millions sterling towards the expense of the Afghan war?—I think there was such an item, but there was a very large Indian expenditure on the Afghan war.

9296. Yes; but England did contribute to assist India?—Yes. I think in 1880–81 there is no less than 7 crores charged for war, and 5½ crores in 1881–82. That is nearly 13 crores in two years.

9297. I think you alluded to silver, or the rupee, as possibly in the future becoming a coin of widely extended use in Africa?—Yes.

9298. How far is it the case that at present four different Protectorates have moved in the direction of a gold standard rather than silver? Have you given any attention to that?—No. I know that the rupee is the coin of Zanzibar.

9299. The rupee is no doubt used by coolies who have emigrated from India, but can you say anything further than that?—What I had in my mind was that for a few years past there has been a kind of scare about silver and a desire to boycott it, which is, I think, very unfortunate; and I think, if the Indian mints were opened, silver would come to be in favour in most of those countries.

9300. You think those countries might follow suit?—Yes.

9301. You say that, in your opinion, "the Government is shifting the burden on to the country and "trade"?—Yes.

Note by Witness.—The expenditure on Public Works is given in the official returns as follows:—

	Rx.
1877–78	5,066,965
1878–79	5,171,501
1879–80	6,371,166
1880–81	7,397,443
1881–82	6,393,531
1882–83	7,165,747
1883–84	6,580,721

Mr. D. Graham, C.I.E.

15 Nov. 1898.

9302. But must not the country and the trade bear the burden in any case? The Government cannot be separated from the country and the trade?—The burden thrown on the trade is this money stringency; the Government has artificially raised the rupee for the mere sake of balancing the budget.

9303. But still the Government cannot be isolated from the country. The country at large must bear the burden in some way?—I entirely agree, but my point was that the Government has, as a matter of fact, separated itself and considered itself as something different from the country and trade, and has described the loss in exchange as a loss to the country, which it is not.

9304. It is a loss just so far as taxation would be a loss to the country?—Well, it is as broad as it is long.

9305. When you say that it is as broad as it is long, in what form do you think that a benefit to a country arises from a lower exchange?—My point is that the debt is paid in produce—it is not paid in rupees. The Government save on the Council drafts by a high rupee, while the country suffers in consequence by the artificial contraction of the money market. In my opinion, the loss to the country is really greater than the gain to the Government, but, as far as the actual payment of the debt is concerned, it is the same.

9306. Taking the country as a whole, it is neither a loss nor a gain?—Just so.

9307. It is the sterling value of the produce which you must consider?—Exactly.

9308. Taking the country as a whole, what is the effect of importations of silver? I am assuming that silver falls, and that more is taken by India in payment for exports, so that a larger amount might be available for currency. As between India and countries abroad, England for instance, would you say that there is any difference, for that it is merely that a certain amount of sterling value is sent in silver instead of some other form?—Very much so. It would come in as an import with other commodities.

9309. But a larger quantity, owing to the fall in price?—Yes, and owing to its suitability for India.

9310. Then taking India itself, and the different interests in India, would not some producers and mercantile houses make a profit on the importation of silver and the higher prices of produce?—In the first instance they would.

9311. But would not that be paid by the purchasers in India? Would it not be a transfer of wealth in India itself?—There would be a gradual distribution, but, if there was a general rise, it would be distributed all over.

9312 But, so far as there is a rise, somebody has to pay a higher price. I am assuming that it is not that England pays more, but that in India prices generally are higher. That would be a case where every consumer would pay more?—Yes.

9313. And every seller would receive more?—Yes.

9314. But, so far as there may be a difference of interest between the seller and the purchaser, there would be an unequal distribution?—To a certain extent there would, yes. The poorer classes in India are producers more than consumers.

9315. You say, "for the internal trader to buy gold in "order to get it exchanged into rupees at 1*s.* $4\frac{1}{16}$*d.*, "presupposes that he already has the rupees, and there- "fore, however great the scarcity, the operation would "be a senseless one for him." Would not the producer be in the same position for obtaining gold under the present system as he would have been for obtaining silver under open mints? Has he not in each case to part with his produce or goods, whatever they may be?—Yes; but I was answering the question which has been frequently put, and I think it was put here this afternoon. Why does not a trader in the country take gold to the mints and get silver for it? My answer to that is that no internal trader has any interest in so taking it; he would have to buy gold to take it to the mint, and to buy gold means that he must have the rupees, and he would be just where he was before. He would only buy gold to take it to the mint, if there was some profit, that is, if the price in the market was less than the mint price, whereas it has always been more.

9316. In any case the silver or the gold would come in as the result of trade?—There is no silver now received at the mint.

9317. But silver under open mints, or gold on a gold basis, would in either case, come into the country for circulation through the immediate agency of foreign trade, and the internal trader would obtain command of gold or silver by selling his produce?—Yes, but he might not sell it for foreign trade, he might sell it to somebody in the interior of the country.

9318. Still, in that case, he would be paid?—He would be paid, yes, but in silver rupees, the only legal tender money. If gold was also made legal tender money, he would be paid in whichever was cheapest in the market. I was thinking of that particular question that has been asked so often: Why is it that gold is not taken to the mints, and rupees got in exchange for it? It is said: How is it possible that money is dear, when people could get it on paying gold for it at the rate of 1*s.* 4*d.* the rupee? My answer to that is that it is to no one's interest to pay gold at the rate of 1*s.* 4*d.* the rupee.

9319. Is that owing to the apprehension that exchange will fall?—It is not so much apprehension; it is a matter of market price. As long as they can get $15\frac{1}{4}$ rupees in the market, they will not give sovereigns to Government at the rate of 15 rupees.

9320. But a person who has anything to sell can obtain either rupees or gold?—Oh, yes; if he wanted it. He would first sell for silver rupees, the currency of the country. If he wanted gold, he would have to pay the market price for it. He would not in that case take the gold to the mint.

9321. I think, as to prices, you preferred not to discuss the Government tables?—I said that I had tried to go into the matter of prices, but I found, through the many circumstances connected with different articles, I could not draw any inference.

9322. This diagram exhibits the aggregate of all prices; it would point to the level of prices up to a recent date as being about the same as that in other times of scarcity. Now, just so far as that is a sufficient representation of the facts, it would point to prices not having yet been lowered by the existing policy?—No, they have not been lowered.

9323. That is going so far as one can infer at all; of course there may be other explanations?—Yes; it may be too soon perhaps to judge—the existing policy only began to tell in 1897.

9324. What evidence do you consider there is that low exchange in the past did increase exports on the average?—I think, as a matter of fact, there was a great increase of trade after each of the great falls. The first great fall was in 1876–77. It was followed by a large increase of trade in 1879 and several succeeding years. The next great fall was in 1885–86 and 1886–87. Again a great increase of trade in 1888–89 and 1889–90 followed. Then came another fall in 1892–93, and again a rapid increase of trade in 1894–95 and 1895–96. The check came in 1896–97, but how far this was owing to plague and famine, and how far to money stringency, it is impossible to say.

9325. There may have been other causes that bore upon that?—There may have been other causes. There was very little movement before the great fall; then it increased very rapidly, according to the figures here.

9326. There may have been other reasons, such as the construction of railways and the development of the country?—Oh! yes; and, on the other hand, a point I made was that, if there had not been this fall of exchange, if silver had remained the same, there would have been a fall in commodities similar to what there was in gold countries, and, therefore, that would have been a great loss to the country; the country would have suffered from the general fall of prices.

9327. In the way of not obtaining the same amount of rupees?—There would have been a general fall of prices, and we know that, when there is a general fall of prices, it creates a great deal of distress in all quarters.

9328. During the American Civil War, there was a great increase in the paper currency of the United States and a corresponding rise in prices?—Yes.

9329. Should you say that the rise of prices during that period contributed to a larger export trade and a larger business generally?—Well, I have not any knowledge of the subject. I have never looked into that matter, and I would not like to venture an opinion.

9330. As a principle, you would think that high prices, due to the currency, would contribute to a permanent development of trade?—I think so. An ample supply of currency must surely help to stimulate production.

9331. A distinction might be drawn between high prices in India that arise merely from the expansion of currency, from a larger amount of silver being brought in and coined, and high prices arising from higher sterling values in markets abroad?—Oh, yes, the two causes would be quite distinct.

9332. A rise of prices from an expansion of currency would not affect the country's position abroad. As you say in your note, India, as a whole, would be in the same position?—It would stimulate her productions.

9333. So far as production was increased, and sterling price was not lowered, that would affect her position, but that is all?—That is all.

9334. That is the measure of it?—That is the measure of it, I think.

The witness withdrew.

Adjourned.

Note subsequently handed in by Witness.

I desire to add a few brief remarks on important points which were not touched upon in my examination. The questions put to me referred mostly to the past, and the evidence which I gave was directed towards showing that no sufficient case had been made out for closing the mints in 1893, and that the results had not been fortunate. With reference to the future, I have expressed the view that the only question of currency is the contraction of the currency, and, provided that some plan can be devised for relieving any pressure which, as the active season advances, may bear upon the money market, the question of open or closed mints may remain a little longer in abeyance. In the first place, I think that the full effects of the closing of the mints may not have had time to show themselves; and, in the second, that any new changes of an experimental character should only be entered upon after very full and critical examination. Mr. Lindsay's scheme has deservedly received much attention and is supported by many authorities. My opinion is that the elasticity allowed in it is insufficient; that the convertibility provided for involves much greater risk and responsibility than is contemplated; and that the principle underlying it, namely, that the rate of exchange, and not the rate of discount, is the test of deficiency or redundancy of the currency, is wrong and mischievous. I hold that, while exchange may be the measure of the requirements of the foreign trade, that of the internal trade is the rate of discount, and consequently that the scheme makes no adequate provision for the currency wants of the country. There are great practical difficulties to contend with—the great existing silver circulation, the large sterling obligations, the seasonal character of the trade, and the risk of an adverse trade balance. Considering all these, it seems almost impossible to reconcile the necessities of the country, in the way of a free and elastic currency, with the limitation necessary to maintain the nominal par of a gold standard.

There is the alternative of a gold currency. I take it that the essential conditions of a gold currency are, first, that it must be accompanied by an abundance of silver token coinage according to the utmost requirements of the trade and the people, and second, that convertibility of it with the standard must be at all times and under all circumstances assured. The first difficulty is to get a sufficient gold stock on which to declare convertibility, and the second is to retain that stock when once convertibility has been declared. The cost of creating and keeping a gold stock (which, except as so far as it represented paper in circulation, would be wastefully idle) would be a crushing addition to the burdens of the country, while recent history is full of warnings that only the most favourable circumstances can ensure the retention of the stock.

There remains the plan of reversal and the opening of the mints. Before 1893, India had a free and automatic currency, suitable for the habits of the people and the character of the trade, fairly steady as a standard of value, and under which the country prospered. Why not revert to it? The sterling obligations are no doubt unfortunate, but there they are, and they must be met. It cannot in any way mitigate or modify them to give the rupee a local and fictitious value, which has no recognition on the part of the creditor, and which is forced by a contraction which only hampers the trade and checks the development of the resources out of which alone the obligations must be paid. My belief is that all schemes which are not in full harmony with the special conditions of India, or not backed by sound and accepted principles, are doomed to disappointment, and that a return to open mints is not only the most safe and prudent course, but the one which in the long run will be found inevitable.

DONALD GRAHAM.

TWENTY-FIRST DAY.

Wednesday, 16th November 1898.

PRESENT:

SIR FRANCIS MOWATT, K.C.B. (in the Chair).

SIR JOHN MUIR, Bart.
SIR C. CROSTHWAITE, K.C.S.I.
SIR ALFRED DENT, K.C.M.G.
MR. ROBERT CAMPBELL.
MR. F. C. LE MARCHANT.

MR. ROBERT CHALMERS, *Secretary*.

Mr. D. Cruickshank.

16 Nov. 1898.

MR. DAVID CRUICKSHANK, called and examined.

9335. (*Sir F. Mowatt.*) Will you state your name and position?—I am a member of the firm of Messrs. Begg, Dunlop, and Company, merchants and agents in Calcutta and London, and especially interested in indigo and tea.

9336. You are Chairman of the new Indigo Association?—Yes, they have elected me President.

9337. Were you opposed to the closing of the Indian mints in 1893?—I expressed no opinion upon it in 1893, but I was opposed to it before, when my opinion was asked on the subject by the Government.

9338. When you say before, do you mean shortly before, or at what previous period?—There was a proposal to establish a gold standard in 1886, put forward by General Strachey. At that time my views were asked by the Government, and I recorded a minute on the subject, in which I was opposed to the closing of the mints.

9339. Was that on the general ground that it would amount to a check on the export trade?—Yes, owing to the divergence which would have been created between the value of the rupee and the value of silver, and the effect of that on the export trade of India.

9340. Your view being that the rupee should exactly correspond with the market price of silver at the time?—The effect of giving an artificial value to the rupee, in my opinion, operates to the disadvantage of the export trade of India.

9341. Your view was that no artificial value should be given to the rupee at all, that it should find its level with the price of silver. May I take it that that was the main ground of your opposition, or were there other reasons then, or are there reasons of which you feel the force now?—What I said at the time in the minute which I recorded was: "Generally, the "adoption of General Strachey's proposals would "have a prejudicial effect on Indian exports, which "it should be the object of the Government to "encourage by every possible means, so as to increase "the balance of trade in favour of this country" (that is India) "and thus lead to a greater demand for "silver." That of course was in connexion with the fact that at that time the price of silver regulated exchange more or less.

9342. I take it that you still entertain those views now: nothing has happened since to alter your opinion?—As regards the effect of the artificial rise in the value of the rupee upon the export trade, certainly my views are not changed.

9343. Taking the trade in which, I think, you are more directly interested, that of tea, will you state what injurious effects have been, in your opinion, produced on that trade by the closure of the mints in 1893?—In the case of tea, sterling prices being settled by means of supply and demand, and taking the sterling value of a pound of tea at 9*d.*, the equivalent of this at 1*s.* 0½*d.* per rupee (being the lowest point to which exchange fell) would be 9 annas 11 pies. At the exchange at 1*s.* 4*d.*, the equivalent would be 7 annas 9 pies, showing a difference against the planter of 2 annas 2 pies, or about 22 per cent., if he sells his tea in Calcutta.

9344. That is really the price you consider the tea trade pays for the closing of the mints?—Certainly, if exchange had remained at the lowest point to which it fell, 1*s.* 0½*d.*

9345. At what point, subsequent to 1893, did the trade begin to feel the effect of that? How soon after 1893?—When exchange rose. Exchange first rose materially in 1896. The lowest point in 1895—at least the average for the Secretary of State's Bills, in 1895—was 1*s.* 1·64*d.*, and in 1896, 1*s.* 2·45*d.* Of course, any rise in exchange affects the rupee price of tea.

9346. What effect had that upon the profits of the tea trade? They continued very considerable through 1896, did they not? The trade was doing very well?—The profits of 1897 were affected by the lower prices.

9347. Has the extension of cultivation in India been checked by a falling off in the profits on tea?—Certainly it is being checked.

9348. The pinch began to be felt in 1896?—It is being felt now worse than ever. It is well known that extensions have been largely stopped wherever it was possible to do so, and the strongest evidence of this is seen in the fact that tea-seed has become practically unsaleable, which it is at the present moment.

9349. You cite that as showing that there is no disposition to extend the gardens now?—Just so.

9350. You said, I think, that tea depended a great deal upon the ordinary law of supply and demand?—Sterling prices.

9351. Sterling prices have somewhat fallen, have they not?—They have fallen during this present year. The average price of Indian tea sold in London for the year 1897 was 9*d.* per lb. The average price of Indian tea sold in 1898, up to the present time, is 8·68*d.* per lb.

9352. How far do you consider that that has been affected by the supply being greater than the demand?—The supply has affected the prices of tea, but the fall in prices led to an increased consumption, which has enabled the increased output to be taken off. As a matter of fact, at the present moment the position of tea is statistically better than it has been for some time.

9353. What do you mean by "statistically better"?—That is as regards stocks.

9354. The stocks in London now in hand are smaller?—The stocks in hand are smaller than they were this time last year.

9355. Should you say that that fall in price has at all been caused by the supply of tea being greater than the demand for it in the markets which are now open to the tea trade?—The increased output of tea has only been taken off by lowering prices, but at the reduced price the increase has gone into consumption.

9356. Now would you state what you consider the direct effect of a high exchange on the tea-growing industry of India, apart from the sterling price of tea in the London market? How does it affect your profits?—It reduces our profits.

9357. It reduces your profits in what way?—Of course, the prices of tea in rupees are governed by the sterling prices. In reply to a previous question I said, if you take the value of a pound of tea at 9*d.*, which was the average price of tea in London last year, the equivalent of that at 1*s.* 0½*d.* would be 9 annas 11 pies, and at 1*s.* 4*d.* the equivalent would be 7 annas 9 pies, showing a difference of 2 annas 2 pies against the planter; that is to say, he gets less in rupees than he would at the lower exchange.

9358. The cost of producing the tea is unaffected?—The cost is unaffected.

9359. As regards indigo, is that affected in exactly the same way?—Yes, in a similar way. Taking the sterling price of indigo at 4*s.* per lb., the equivalent of this at an exchange of 1*s.* 0½*d.* would be 250 rupees per maund. At the exchange of 1*s.* 4*d.*, the equivalent would be 195 rupees per maund, showing a difference against the planter of 55 rupees per maund, or about 22 per cent., and representing on the present season's crop of Bengal, Behar, and North-West indigo a loss of Rx. 6.82.000.

9360. What effect has that had on the indigo trade as regards the amount of its output? Has it begun to check it?—It will now. The effect of low prices on the production of indigo is shown by the following extract from a London broker's circular, dated 4th October 1898:—"The final estimates of the crop "from Calcutta give the very moderate total of "maunds 124,000, or about maunds 13,000 below the "average of the last ten years. The very small out-"turn in Benares and Doab is largely due to decreased "cultivation, on account of unremunerative prices, "and, should the coming Calcutta season show no im-"provement on the rates ruling in July, we have no "doubt that a considerably smaller area will be sown "next season in Lower Bengal and Behar. From "Madras we hear of the same complaint, that present "prices do not pay the cultivator, and that the area "under indigo has consequently been reduced, and "the crop is likely to be a very small one."

9361. Who are our competitors with India in indigo?—Java is a competitor, and indigo comes from Guatemala also.

9362. When you say it does not pay the producer, is it the competition from outside that you refer to?—One thing that is affecting indigo at the present moment is an artificial dye made in Germany, which, it is possible, may be developed into something that will materially affect the consumption of indigo.

9363. And that is sold at a lower price?—It is not sold at a lower price at present, but we do not know whether they may not be able to produce it at a lower price.

9364. That is a consideration quite apart from the rate of exchange or the profits of the trade, is it not? I mean, if indigo were supplanted by some invention, it would not very much matter, unless you thought you could undersell it, whether the exchange were high or low in India?—Of course it is hoped that we should be able to undersell it; but, as a high exchange operates against indigo, it handicaps India in its competition with this artificial dye.

9365. So far as price goes; but if the dye supersedes it because it is in other respects better —— ?—It is a matter of price.

9366. But it is the fear of that that you refer to?—No, it is a matter of price.

9367. What relation do you consider existed between the volume of the currency and the rates of discount in India, before the mints were closed? Did the fact that the volume of currency was larger than at present affect the discount rates?—It cheapened money. The more abundant money is, the cheaper it will be, naturally.

9368. Do you distinguish generally between currency and loanable capital?—Capital to be available for trade purposes must exist in the form of currency, and, if money is dear, that is a sure sign of scarcity.

9369. Of scarcity of currency?—Yes.

9370. But may I put what I mean in this way? I understood you to say that there were not enough rupees, for instance, in this last busy season, to carry on the trade of the country?—There was stringency.

9371. But any person producing gold to the Government could have claimed from them rupees at the rate of 15 to the sovereign?—He could have done so.

9372. And they would have been bound to produce it, even if they had to coin more rupees?—Quite so. But the price of gold as fixed by Government was too low.

9373. If there had been loanable capital, if there had been gold, or if there had been securities which would have produced gold, that could have been made to reappear as rupees. So that there is a distinction, is there not, between the loanable capital that could have been made into currency, and the currency itself?—But you would have to attract gold to the country, and you can only do that if you make it profitable to import it in the shape of currency.

9374. Now, as regards the stringency on that occasion, did it extend, do you think, to the internal trade of India generally, or merely to the external trade with other countries?—It extended to the interior. In the course of correspondence with Calcutta, I have got the following information with regard to stringency in the Mofussil, that is to say, in the interior. In a letter dated Calcutta, 18 August 1898, my correspondent writes: "You ask, cannot we "from November next get our indigo constituents "to draw drafts at 90 d/s. to tide over the worst "period of stringency?" (The stringency hitherto has been greatest in about December, January, and February.) "Now the position is much worse in the "Mofussil than in Calcutta, with the result that "many indigo concerns this present season have been "quite unable to cash their drafts at 60 d/s., and "some not even at 30 d/s., and we have been obliged "to a certain extent to remit outlays in currency "notes. The present currency policy can only in-"crease this difficulty, and I fear it would be quite "impossible for us to get concerns to draw at the "usance you name." In a letter dated Calcutta, 29th September 1898, it is stated: "It is well nigh "impossible to get reliable statistics in reference to "India's vast internal trade. That there is great "dearth of loanable capital in the hands of native "bankers, who were formerly rich and ready to lend "largely, there is no doubt. Take a place we know "well, like ——, the local bankers there, such as the "—— and others, are practically insolvent, and "——, ——, ——, and others tell me there is "literally no money there for trade purposes. In "Cawnpore, too, we know money was most stringent "during the first six months of the year. But it is "generally believed the stringency in India would have "been greater but for the help of illicit coinage." Then in a letter dated Cawnpore, April 1898, there is this passage referring to the working of a factory ——

9375. Are these from your own correspondents?—Yes. "The result will not be as satisfactory as it "should have been, owing to factors entirely outside "the working of the factory or our control, viz., "exchange at 1*s.* 4*d.*, scarcity of money in the bazaar; "high rates of interest (15 per cent. and over), and "the paralysis in the trade caused by the failure of "some big native firms. To give you some idea of "the position, a Rajputana dealer, to whom anyone

Mr. D. Cruickshank.

16 Nov. 1898.

"in the trade would have given credit last year, came "to our brokers for 500 bags fine grain, and they "would not undertake that his account was safe." This refers to the position in the interior.

9376. Those are letters addressed to your firm by your own correspondents?—They are addressed to me, personally.

9377. Do you anticipate that this present season will show as great a stringency as last year?—That is generally expected.

9378. Or even greater? We have had opinions both ways?—Well, it is expected in Calcutta that there will be stringency again this year; to what extent it is difficult to say.

9379. But it is rather important, is it not, whether it will be the same as last year, or whether there are other factors which are likely to reduce it?—I should say it would be quite as bad as last year, unless other factors come into operation which either lessen the demand for money or increase the available supply for it.

9380. There have been cases, have there not, of almost equally severe stringency in India before the mints were closed?—The bank of Bengal average rate for half-year to 30th June 1898 was 11·016 per cent., being the highest for over 30 years, the previous highest having been in the half year to 30th June 1866, when there was a monetary crisis at the time of the failure of the old Agra Bank.

9381. But I find, according to a table we have here, that in 1889, and again in 1890, it touched 12 per cent.?—For a short period.

9382. As we have it in the return furnished to us, it touched 12 per cent. in 1874, 1889, and 1890; and 10 per cent. in 1894 and 1897?—I have got the whole returns here since 1854. I, of course, am dealing with the average rate for the half-year, not with the maximum or minimum rates.

9383. Do you regard stability of exchange as of great importance to the trade in India?—Yes, I think it is desirable to have a stable exchange, so long as it is not fixed at too high a rate.

9384. Do you think it is the distrust in the future of exchange that has driven the capital of the banks, and of individuals, out of India?—I think so.

9385 You have said, I think, generally, that you object to the present proposals of the Indian Government. Do you object generally to the principle of a gold standard for India?—Not at the rate at which a gold standard can be maintained without prejudice to the interests of India as an exporting country.

9386. Then it is the rate at which it is fixed that you consider important, and you do not object to the general principle of a gold standard for India?—No. The conclusions to which I have been led by the consideration I have been able to give to the matter are:—(1) That in the position in which India stands as a debtor country, with large sterling liabilities which can only be liquidated in produce, the dominant factor in Exchange is the export trade, and (2) that no scheme for the establishment of a gold standard or gold currency can succeed, if the measures adopted for that purpose have the effect of disturbing the balance of trade in favour of India. It follows that no undue burden should be placed on the products of the country, whereas the effect of the present currency policy of the Government of India, and of the further proposals put forward, is to impose indirectly a heavy tax upon exports and to increase the cost of production by raising the value of money. The result of this policy must be to hamper India in its competition with other countries, and may eventually lead to the balance of trade being turned against her, when any scheme for establishing a gold currency must necessarily collapse, and Government would be obliged then to have recourse to the additional direct taxation which they are now anxious to avoid. With quicker means of communication and greater facilities for transport all over the world, the competition for the supply of commodities becomes keener, and the advantage in the contest must lie with the country in which the cost of production is lowest. Up to the time of the closing of the mints, India competed on a par with other silver countries, but the artificial rise in the value of the rupee operates to her prejudice and must affect her export trade. It is contended, as a reason for adhering to an exchange of 1*s.* 4*d.*, that prices have adjusted themselves to that rate (Mr. Arthur, 2033), and it is stated that trade will adjust itself to any rate (Mr. Finlay, 3039), rupee prices falling as exchange rises (Mr. Finlay, 2640, 2696, 2702). It is quite true that prices will adjust themselves to any rate of exchange, and, if this was the only point to be considered, there is no reason why 1*s.* 6*d.*, 1*s.* 9*d.*, or 2*s.* should not have been fixed upon instead of 1*s.* 4*d.*; but, in their despatch dated the 16th September 1897, the Government of India recognise the probable disastrous effects of a great rise in exchange on the export trade and industries of India, and give it as their opinion "that the true interests of India demand that any "measures for attaining stability in the rate of "exchange between gold and silver should be based "upon a rate not greatly differing from 16*d.* the "rupee, and that any measure which would raise the "rupee materially higher than that level involves "great dangers," for which they could see "no "adequate compensations." The same objections must, however, be held to apply to the rate of 1*s.* 4*d.*, if such rate is higher than that required by the conditions of trade. And the difference between what may be termed the natural rate and the artificial one must operate to the prejudice of producers. Mr. Finlay admits (3257) that the material point as regards the Government and the country is that there should be a sufficiency of exports to meet their requirements abroad, and he relies (2696, 2698, 3045) upon the balance of trade being maintained through a fall in rupee prices, resulting from the contraction of the currency and a rise in Exchange. The extent to which a fall in prices is possible must, however, depend upon the cost of production. As soon as an article ceases to pay, its production will diminish, and the exports of same fall off, or stop altogether. In this connexion, the following remarks by the Government of India, in their despatch dated the 16th September 1897, deserve very careful consideration:—"Pressed "as we have been for many years by the difficulty of "finding the continually increasing number of rupees "requisite to discharge our sterling liabilities, we are "apt to look too exclusively at the effect which a rise "of Exchange would have in diminishing the burden "of that demand upon us. We do not deny that a "large surplus of revenue will arise from so great "an improvement in Exchange; but it is not to be "forgotten that there are many respects in which "our revenue account must directly suffer by a rise "in the Exchange value of the rupee, and that these "considerations ought to greatly influence our estimate "of the benefit to our revenue account, which is almost "the sole advantage which, as a Government, we can "expect to obtain from the proposed measures. The "anticipated fall in prices is one that will adversely "affect both our revenues and the general condition of "the agricultural classes in the country. To take the "case of our land revenue, a very large portion of the "country has passed under land revenue settlement "during the last 10 or 15 years. One of the factors "in fixing the demand of the Government for revenue "is the price of agricultural produce; if that price "falls away, the heavier the demand becomes; and, if "it falls away materially, the relation between the "price that the ryot can obtain for his produce and "the assessment he has to meet may be so seriously "altered as to affect the agricultural prosperity of "large tracts of country. The work of resettlement "is a tedious one, it cannot be effected in all proba-"bility for some years, and, when it is effected, it will "*pro tanto* dissipate much of the advantage which "the rise of Exchange would bring to the Govern-"ment account. So, also, as regards our railway "revenues, which are now so important a portion of "our income. They are in part directly dependent

" upon the activity of the export trade, and a blow " struck at that trade will be felt by us immediately " and directly through our railway account."

Although the importance of the export trade as enabling India to meet its foreign obligations, adding both to the land and railway revenues of the country and improving the general condition of the agricultural classes, is thus fully recognised, the Government have put forward proposals which, by adding to the cost of production and lowering prices, will have the effect of diminishing their own revenues and imposing a heavy burden upon producers generally. As showing the effect on prices, I want to quote what is said in the " Review of the Trade of India in 1897–98 ", which I only got yesterday. The author writes as regards exports:—" The general " causes which restricted the export trade have " been already mentioned. The largest decrease is " in raw cotton, the exports of which to Europe fell " away greatly under the competition of American " cotton, which was exceptionally cheap and abun- " dant. Opium and indigo show large decreases both " in quantity and price. The decreased values of " raw jute and tea are entirely due to a fall in " prices, the quantities exported being unprecedentedly " large. The trade in cotton piece-goods was de- " pressed, the exports to China showing a great " falling off, and the exports of sugar declined to a " very low level. On the other hand, large increases " are recorded under hides and skins, jute manufac- " tures, and timber, the trade in which was very " active, and there was an improvement in seeds, wool, " and oils, which, in the case of the first-named, is " still more marked in the present year. There was " but a slight increase in food grains, but during the " first quarter of this year the trade in rice and wheat " was very active, the exports of the latter during " that period amounting to 566,138 tons, value " Rx. 6,055,308." Of course the large exports of wheat in the present year are owing to the increase in sterling price.

9387. Would your objection to a gold standard, at 16*d.* the rupee, apply equally to a rupee at a somewhat lower price?—Not equally. Regarding the proposals for the establishment of a gold standard—these, while differing in some points, are all based upon a rate of 1*s.* 4*d.*, and are open to the objection which I have indicated in regard to the Government scheme, viz.:—that they do not take into account the effect on trade of the measures required to maintain the rate proposed, and the danger that the result may be to turn the balance of trade against India, when any scheme adopted would necessarily collapse. The best known of the schemes proposed is that associated with the name of Mr. Lindsay, to which other obvious objections have been put forward: that it would involve the Government of India in an indefinite liability to give gold in exchange for rupees; that it would entail continued interference by Government with the currency, which is undesirable; that it would also necessitate the withdrawal from use, and the locking up, of a large amount of gold, which might affect sterling prices to the disadvantage of India, and would add to the sterling obligations of the country. I have already stated that I believe no scheme for the establishment of a gold standard on the basis of the rate of 1*s.* 4*d.* per rupee will succeed; and, if a lower rate approximating to the natural level of Exchange required by trade conditions is fixed upon, I do not see that any special measures, such as those suggested by Mr. Lindsay and others, would be required to maintain the same.

9388. Were you there contemplating a 10*d.* rupee?—No.

9389. What then?—1*s.* 4*d.*

9390. But you say, " were a lower rate fixed "?—I was going on to that. The difficulty arises in fixing upon the rate which, it may be expected, would be maintained by the conditions of trade. An indication of this might have been got if the value of the rupee had not been affected by the closing of the mints, as it has been apparent that, while the fall in the value of the rupee in relation to gold has been beneficial to India, by maintaining the rupee values of produce in the face of the fall which has taken place in sterling prices, and by enabling its exports to compete advantageously with the productions of countries using a gold standard, this benefit must have a limit, which would be reached when the purchasing power of the rupee fell, or, in other words, when a general rise took place in the prices of Indian commodities. Up to the time of the closing of the mints there is no decided evidence, so far as I can judge, of any material rise in the rupee values of the principal articles of export ——

9391. Do you say prior to the closing of the mints?—Up to the time of the closing of the mints,—which would indicate that this point had been reached. With regard to prices, Mr. O'Conor states (850): " In " the case of articles which are chiefly intended for " export, prices have not risen in all cases; in some " cases they have remained stationary or fallen. The " tendency is to follow gold prices." He goes on to add: " The prices I refer to as having risen are prices " of ordinary food grains, which do not enter really " into the export trade.' Sir A. P. MacDonnell in his evidence states (5721, 5722): " From 1860 to 1873, " about the time when the currency depreciated, there " was considerable oscillation in prices; from 1873 " until 1885 there was less oscillation. The tendency " was generally upwards, but the variations were " marked. Prices steadied from 1885 till the mints " were closed in 1893. There was a great stability " in prices with a tendency upwards." Further on (5774) Sir A. P. MacDonnell states: " Apart from the " dislocation caused by the famine and bad seasons, " the purchasing power of the rupee has remained " pretty steady. There have been local variations of " course, owing to scarcity and so on, but, apart from " these, the purchasing power of the rupee has " remained steady from the middle of 1886 to the " middle of 1893." The explanation in regard to a rise in prices in some parts of the interior of the country, is, no doubt, that the extension of railways and improved means of communication have tended to equalize prices by raising them in districts in which, owing to previous want of access to central markets, commodities were cheap, and this is brought out in Sir A. P. MacDonnell's replies to Questions 5812, 5813, 5814. Assuming, then, that the purchasing power of the rupee had not fallen up to the time of the closing of the mints, or, in other words, that the rupee had not depreciated in value in relation to commodities in India, the limit of the benefit resulting from the fall in its value in relation to gold had not been reached up to that time. I should have expected, if exchange had remained at about the lowest point to which it fell in 1894, say, between 1*s.* and 1*s.* 1*d.*, that the tendency would have been for the purchasing power of the rupee to fall, and, assuming this to be the case, the natural level of Exchange required by conditions of trade would approximate to that point. The nearer the rate fixed upon approached that point, the greater the probability that the scheme for the establishment of a gold standard would be successful. Having regard, however, to the benefit which would result from a comparatively stable Exchange in the influx of capital for industrial purposes and in cheaper money, it may be expected that the trade of the country could stand a somewhat higher rate of Exchange, and, in suggesting a modification of the present currency scheme of the Government, I should be in favour of adopting the rate of 1*s.* 2*d.* in place of 1*s.* 4*d.* If 1*s.* 2*d.* is fixed upon, there are, I think, reasonable grounds for believing that the rate could be maintained by the conditions of trade without any special measures being necessary for the acquisition of gold, which, under the system of giving rupees in exchange for same, would gradually accumulate in the hands of Government as the requirements of trade necessitated expansion of the currency. It is generally recognised that a gold currency is not required for India at present,

Mr. D. Cruickshank.

16 Nov. 1898.

and it would rest with Government, as gold accumulated in exchange for rupees, to decide whether, and when, it might be desirable to adopt it.

9392. Have you any opinion as to the convertibility of the rupee into gold otherwise than, as now, through Exchange?—I do not quite follow that.

9393. Should you hold that the rupee, at whatever rate was fixed, should be convertible into gold absolutely? Do you contemplate the rupee and gold being absolutely convertible in all cases, if the gold standard were introduced?—No, not until it was desired to make the gold currency effective. I think it would be sufficient in the meantime if the Government undertook to give rupees for gold.

9394. Failing some modification of the Indian Government's proposals, you would reopen the mint to silver?—I think that would be better than continuing the present condition of affairs.

9395. And better than a gold standard with a 1*s.* 2*d.* rupee?—I do not say that. My suggestion is to take 1*s.* 2*d.* and endeavour to introduce a gold standard, as the best way, in my opinion, out of the present difficulty.

9396. How would you propose that the Government of India should meet the difficulty of its gold payments in England under those circumstances; have you contemplated any increase of taxation?—That might be necessary, or it might not be. Taking the financial position of India for the last six years; I note that in the two years in which the exchange was lowest—below 1*s.* 2*d.*—there was a surplus; in the other four years there was a deficiency, although the exchange was higher, which would indicate that the revenues of the country would expand with a low exchange.

9397. You would contemplate that a rupee at 1*s.* 2*d.* and a gold standard would so increase the export trade of the country that additional taxation would not become necessary, unless as a temporary measure?—The revenues would increase by expansion of trade. Whether that would be sufficient to meet at present all the sterling obligations of the Government, it is difficult to say. There might be necessity for some additional taxation, which might take the form of increasing the import duties.

9398. You are of opinion that that is the best method of increasing taxation?—I have not gone into the question, but I should think the imports might stand additional taxation.

9399 But you would not advocate an export duty?—Certainly not. I am altogether opposed to duties on exports.

9400. Is there anything you would like to add?—I should like to refer to the effect of the rise in Exchange upon imports. While the currency policy of the Government is shown to be prejudicial to the interests of Indian producers, and likely to affect in consequence the revenues of the country, the artificial rise in Exchange operates in favour of foreign manufacturers, and, by stimulating the importation of manufactured goods, tends to injure Indian industries, and to check new enterprises which would help to develop the country and increase its capacity for exporting. The principal article of merchandise imported into India is cotton goods, and, while the manufacturers of same have been favoured by the rise in Exchange, they have also had the advantages of the low prices ruling for raw cotton during the last five years. A reference appeared in one of the daily papers last week to the unprecedented cheapness of raw cotton at the present time, and, in explanation of same, it was stated that an exhaustive report furnished by bankers in the Southern States of America estimates that in most sections the cost of production is only about one half what it was ten years ago, the current price—five cents a pound at port of loading—yielding, consequently, about the same profit as double the price did a decade back. European manufacturers of cotton goods have, therefore, a double advantage, in the unprecedentedly low price of raw cotton, and the artificial rise in Exchange. An article the imports of which into India have been stimulated and largely increased by the rise in Exchange, is beet sugar. The following statement shows the extent of the increase:—Extract from Trade and Navigation accounts of British India for the month of March 1898, and the twelve months, 1st April 1897 to 31st March 1898:—

IMPORTS—FOREIGN TRADE.

Sugar—Refined and Crystallised.

Average rate of Exchange for Secretary of State's bills, - - 1*s.* 1·64*d.*, 1*s.* 2·45*d.*, 1*s.* 3·35*d.*

It will be observed that the imports from Austria-Hungary and Germany have increased three-fold during the past three years. In the Review of the Trade of India for 1897–98 the following reference to this matter is made:—"The increase in the importa-" tions of sugar is one of the most noticeable features " in the import trade of the year. The quantity " imported is 61 per cent. greater than in 1896–97, " and the value is higher by Rx. 1,632,650. The " first place is still held by Mauritius, but, whereas " the importation of 1,666,845 cwts. in 1896–7 was " 58 per cent. of the whole trade, last year its share " was reduced to 38 per cent., with an import of " 1,778,016 cwts. There is an increase from all the " sources of supply, but the bounty-fed beet sugar " from Austria-Hungary and Germany has flooded " the market. These countries have been forced to " find an outlet for their sugar in the markets of the " East, by reason of the closing of the United States " market by the Dingley tariff, which imposed a " countervailing duty equal to the export bounty, and " the competition of France in the English market " due to an enhanced export bounty on French " sugar." In connexion with this matter, a note on the effects of the unrestricted importation of bounty-fed sugar on the sugar-cane industry of India was submitted some months ago by the Bengal Chamber of Commerce to the Government of India, and the following extracts from same are of interest——

9401. That is raising the question of bounty-fed sugar, and the best way of meeting it; I do not know that we need go into that?—It is the effect of the

rise in Exchange in stimulating the import of bounty-fed sugar, because the imports have increased so enormously since the rise in Exchange took place.

9402. Very well, will you read the note to us?—"Broadly speaking, the sugar industry has passed "through two phases, and has entered upon a third. "India was a sugar-exporting country at the begin- "ning of the century. It became, in the course of "years, a self-supplying country, more or less stripped "of its exports. It is now fast taking the position "of an importing country. The causes which led to "the restriction of exports are explained in historical "accounts already in the possession of the Government "of India, and are summed up in State Blue Books "and in the Imperial Dictionary of Economic Pro- "ducts. Imports, when this last was written, had "already begun to take the place of exports. And "'they were drawn,' writes the editor, 'from the "'very countries which were formerly the chief con- "'sumers of our exports.' But at that period—about "1890—the effect on the price of sugar in India and "on home consumption had not become alarming. "'So far,' Dr. Watt remarks, 'it may be safely "'affirmed that the loss of the markets to which India "'formerly exported sugar, and the creation of a "'foreign supply, have not told injuriously upon the "'production of sugar in India, notwithstanding that "'already India imports 3 cwts. for every cwt. "'exported.' But the prospects of the future were "regarded with great apprehension. 'If,' continues "the article, 'the Colonial sugar manufacturers were "'to produce an article competing in price with even "'more expensive qualities of *gur*, the import trade "'would at once become of graver moment than it "'has yet assumed.' That this critical period has "been reached is the main fact which the present note "is intended to illustrate. That the foreign bounty "system benefits Great Britain is well understood. "It assists materially in the provision of a cheap "breakfast table, and the whole population gains. But "in India, a sugar producing country, its effects are "more complicated, and very different; consumers (of "refined sugar), as in Great Britain, are, of course, "*pro tanto* equally benefited, but these do not, as in "Great Britain—and this is an important point—re- "present the whole community. On the other hand the "State, which does represent the whole community, "must, as well as a very large section of the agricul- "tural population, be very injuriously affected. For "the importation of cheap sugar from abroad means "the diminution of sugar production in India, and that "means, as will be shown, the lessening of the ability "of the cultivator to pay rent, of the proprietor to pay "land revenue, of the canal system to realise its rightful "income, and of the manufacturer to compete against "the foreigner. It means, in short, a future necessity "to impose fresh taxes as a set-off against the curtail- "ment of land and water revenue, and this seems to be "the ultimate calamity which has to be averted. The "importance of cane cultivation in the agricultural "scheme of almost every province in India is, perhaps, "hardly appreciated, except by those officials whose "duties have brought them into association with the "settlement of land revenue. The remark may be "found in many a settlement report that in such and "such tracts the entire rent, and therefore the entire "revenue, is paid from the cane field. 'The peasants "say,' writes the Settlement Officer of Bareilly, 'that "'sugar cane is to other tillage as the elephant to "'other beasts.' In almost every settlement report "and district gazetteer of the Punjab, of the North- "Western Provinces, and of Oudh, the extremely "important position held by sugar cane in maintaining "agricultural prosperity is prominently noticed, as the "extracts quoted below sufficiently indicate. While "the cultivator, the landlord, the land revenue, and "the canal revenue, will thus be affected, the manu- "facturing interests of the country will also suffer. "These, perhaps, are less important than those already "dealt with, but they ought not to be ignored. The "manufacture of better classes of sugar is a natural "outlet for capital in a sugar-producing country, and is "one, among many other investments, which tend to "the employment of non-agricultural labour. Nor "must the fact be overlooked that the rise in the value "of the rupee has been in recent years an important "factor in the encouragement of foreign importations. "As that rise has been mainly due to State action, so "the remedy can only be found in action by the State. "The value of the rupee has, since the closing of the "mints, been enhanced by something like 30 per cent., "and the advantage has been to the foreign importer "immediate and positive. To the cultivator of cane the "advantage has been—if he has gained anything at all— "indirect; but, as has often been argued, many years "will elapse before the loss involved in a lower rupee "price, so far as that lower price is due to an enhanced "value of the rupee, will be equalised by lower rupee "prices for labour and for household necessities. In the "meantime the foreign importer will have had the "opportunity to establish a position against him." The note goes on: "In conclusion, in the event of the Con- "tinental subsidies not being done away with, the "measure proposed would free India from the injurious "effects of a pernicious bounty system, which has "enabled beet sugar to disturb the best market, and "threatens, in the interests of alien agricultural popu- "lations, not only to bring industrial ruin on a large "class of our own industrial classes, but to add to the "existing difficulties of the Government the most "dangerous of all problems, an agrarian grievance "calculated to give rise to distrust and discontent, "which, once aroused, might be difficult to allay." The average area under sugar cane for the five years 1892–93 to 1896–97, according to the Government returns, was 2,808,528 acres. The position of the sugar market in August last is thus referred to in advices from Calcutta: "Market here is being seri- "ously affected by excessive beet imports, and prices "are the lowest on record."

Mr. D. Cruickshank.

16 Nov. 1898.

9403. (*Sir J. Muir.*) Is there no other topic upon which you wish to give evidence?—I should like to refer also to the position of salt.

9404. That is one of the first questions upon which I was going to examine you?—In the Calcutta *Englishman* newspaper of the 6th October last, I find the following remarks with regard to a falling off in the salt revenue, and the increased imports of European salt favoured by the high rate of Exchange: —"The resolution on the report of the Board of "Revenue on the administration of the Salt Depart- "ment for the last year lays stress on the fact that "the administration of the Salt Department in Bengal "has a widely different significance from that which "attaches to the same term in the other great "Maritime provinces of Madras and Bombay. In "the two latter provinces there is no import of "foreign salt from over sea, the whole salt supply of "the people being provided by local manufacture, "either by Government agency, or under an Excise "system of licenses. In Madras, for example, the "quantity of salt imported by sea during the past "year was only a little more than 12½ lakhs of "maunds, of which almost all came from Bombay, "whereas 64 lakhs of maunds were manufactured "locally. Similarly, in Bombay during the same "year only a little over 8,000 maunds of foreign salt "were imported by sea, while the quantity manu- "factured locally exceeded 103 lakhs of maunds. In "the case of Bengal, the imports by sea exceeded "122 lakhs of maunds, while the quantity manufac- "tured locally, under Government supervision, was "relatively insignificant, being under two lakhs of "maunds. After rising steadily for three years, the "salt revenue last year showed a decrease amounting "to Rs. 4,94,637 or 1·9 per cent., as compared with "the preceding year. The decrease is attributed to "smaller clearances owing to the famine, and to a "marked falling-off owing to reduced sales of salt at the "Government factories in Orissa, the opening of the "East Coast Railway having facilitated the import "of Ganjam salt on a larger scale, and at a smaller

Mr. D. Cruickshank.

16 Nov. 1898.

"cost: towards the close of the year the imports of "foreign salt into Calcutta were very large. In this "connexion, the collector of customs observes that "the increased importation of Liverpool salt was due "to the action of the Salt Union in sending out a "larger quantity of salt to compete with the crushed "salt from Aden and the Red Sea, and they succeeded "in doing so, as the high rate of Exchange was "in their favour, and they were able to obtain "plentiful and cheap freights from England. The "result of this increased importation was to send "down the prices of salt, and to check the sale of "crushed salt in favour of the Liverpool and Hamburg "article."

9405. I do not quite follow you in your replies to the Chairman in connexion with his question on tea. In 1896, what did you say the average rate of Exchange was?—The average rate of Exchange for Secretary of State's bills in 1896 was 1*s.* 2·45*d.*

9406. What did you say was the general result of the tea trade as brought out by the reports of the companies for 1896?—I made no remarks about 1896. It was 1897 I dealt with.

9407. We will take 1897. What was the average rate of Exchange then?—1*s.* 3·45*d.*

9408. What was the result of the tea industry in 1897?—It was seriously affected by the rise in exchange in the matter of its profits. I will hand in extracts—I suppose I need not read them now—from various tea companies' reports for the year 1897, which bear that out. [*For these extracts, see Appendix.*]

9409. Then I think you said that tea-seed had now become practically unsaleable on account of the stoppage of the extension?—That is the case.

9410. Then, I think, you said that the average price in 1897 of tea was 9*d.*?—Yes, of tea sold in London.

9411. In 1898 it was 8·68*d.*?—Up to the end of October.

9412. That is rather more than a farthing a lb. drop?—Yes; it is not quite a halfpenny.

9413. That is no great thing, the fall being rather more than a farthing a lb. Then you made a remark in reply to the Chairman which led me to think you did not quite understand his question. The question was, "Is the cost of producing tea in India unaffected "by the variations in exchange?" You said, Yes; but I would like just to remind you that, in order to lay down rupees in Calcutta for the payment of wages of your coolies, you must get them at a certain rate of Exchange; it makes a vast difference to the planter whether he can sell his bills upon London to procure his rupees at 1*s.* 0½*d.* or must sell them at 1*s.* 4*d.*?—That is quite true. My reply to the Chairman's question referred to the cost in rupees, not to the laying down of rupees.

9414. Still, in order to provide your funds to pay your coolies' wages and for cultivation expenses, it does make a difference to the planter whether he can get that money from London at 1*s.* 0½*d.* the rupee?—It does make a great difference, and the dearness of money adds to the cost of production.

9415. Then, with regard to indigo, and this artificial dye in Germany, am I correct in saying that that is no better than the real article that we have hitherto had from India, but it is a question of price?—Exactly.

9416. If they increase the production largely in Germany, as it is reported they are trying to do, it may very materially affect the price at which they can produce it; that is to say, they might produce a very big quantity at a lower rate than they can produce a small quantity of the artificial dye?—They may be able to do so.

9417. Therefore, it is of vital importance to the indigo planter in India that he should be able to put down his indigo in Europe at the lowest possible price?—Exactly.

9418. And, therefore, if the rupee cost him 1*s.* 4*d.* in Calcutta, it makes a great difference between that and 1*s.* 0½*d.*, that is to say, it will cost him far more when Exchange is at 1*s.* 4*d.* than when it is at 1*s.* 0½*d.*?—He gets a lower price for his indigo in Calcutta if he sells it there. The sterling prices being regulated by supply and demand, if he sells in Calcutta he gets a smaller price for his indigo with Exchange at 1*s.* 4*d.* than he does with Exchange at 1*s.* 2*d.* or 1*s.* 1*d.*

9419. But, so far as the cost of production is concerned, the same rule applies to him as to the tea planter. He has wages also to lay down for his indigo cultivation?—Quite so.

9420. And, therefore, if he can lay down these wages at 1*s.* 0½*d.*, it is very much better for him than if he has to lay them down at 1*s.* 4*d.*?—That is quite correct.

9421. Then you make in your statement here some reference to illicit coinage. Perhaps you will just briefly express your views as to that, as we have had that question before us on two or three occasions?—A notice that appeared in the *Pioneer* newspaper of September 1898 stated:—"Mr. Henry, the Inspector-"General of Police in Bengal, has some noteworthy "remarks on the subject of illicit coinage in his "annual report: 'During last year,' he observes, "'over 1,000 tons of silver were imported and dis-"'tributed throughout the country; and, having regard "'to the fact that there is a very large number of "'persons competent to manufacture from silver, of "'the value of 11*d.*, rupees which have a fictitious "'value of 1*s.* 4*d.*, the possibility of the counterfeit "'coining of silver rupees being carried on exten-"'sively should not be lost sight of. Many of the "'specimens of counterfeit rupees which come into "'our hands are of excellent workmanship; were it "'not that they are of base metal, their genuineness "'as Queen's coin would in all probability never have "'been challenged.'" This is evidently a very important piece of evidence. During the examination before the Currency Committee of Mr. O'Conor, the Director-General of Statistics, the following dialogue occurred: "*Q.* In your judgment, there has not been much "illicit coinage since the closing of the mints?—We "have no evidence at all of illicit coinage other than "what has been going on from time immemorial. "*Q.* And you would have known it, had there been "any exceptional illicit coinage?—I think it is prac-"tically certain we should have known it." Here, however, is the Inspector-General of Police in Bengal declaring that, if some of the coiners who came under cognizance of the police last year had only been content with a smaller profit, and had made their counterfeits of silver instead of base metal, their workmanship was so excellent that the fraud "would in all probability" never have been discovered. In other words, Mr. Henry virtually says that, if coiners as skilled as those whom he had found operating with base metal, had coined a large portion of the 336 lakhs of "unexpected rupees" of date 1840 and 1862 which emerged last year, their work would in all probability never have been challenged. Thus the evidence of the Director-General of Statistics and that of the Inspector-General of Police in Bengal are almost diametrically opposed on this point.

9422. I understand that your views are in favour of the present system being continued, but on the basis of 1*s.* 2*d.*, instead of 1*s.* 4*d.*, the rupee?—Yes, that is so.

9423. You have given a good deal of consideration to this matter. Is it your impression that, in so far as the two large industries you represent—indigo and tea—are concerned, a 1*s.* 2*d.* rate would enable the trade to go on fairly well?—Certainly, the burden on the industries would be lessened by adopting the lower rate.

9424. Whereas both industries will be killed by the 1*s.* 4*d.*?—They will suffer very materially. It will be a case of the survival of the fittest.

9425. In fact, there may be a repetition to some extent of what has occurred with regard to sugar, which the Government would, equally with the merchant, very greatly deplore. Are you aware that in Calcutta there is a very strong feeling, not only among

Indigo planters and tea planters, and dealers in wheat, but among the great majority of the merchants, against this 1*s.* 4*d.* rate?—I believe that is the general feeling.

9426. We have had evidence to that effect from other witnesses. I would just like you to place on record your views in regard to the remarks made by Lord George Hamilton in the House of Commons on the 17th June last?—Lord George Hamilton, in the House of Commons, on the 17th June last, is reported to have made the following statement:—"I want the "Committee just to realise what difference a slight "rise in the Exchange value of the rupee has done "for Indian finance during the critical period of the "last three years. I will assume, for a minute, that "the rupee had remained at the figure which it "reached during my predecessor's tenure of office— "12·7*d.* At the present moment the silver value of "the rupee is 10·5*d.* I think all will agree that that "is a reasonable figure at which the rupee might be "taken if the Indian Government had done nothing "but stand still, and, if it had remained at that figure," —by which I understand 12·7*d.*—"the loss by Ex- "change during the past three years would have "been Rx. 50,000,000, an excess of Rx. 17,000,000 "over the actual loss that did occur." The gain referred to of Rx. 17,000,000 did not come out of nothing. It was obtained at the expense of Indian producers, including the Government itself, which in 1897 sold 39,000 chests of Bengal opium for Rx. 4,090,198, as against Rx. 5,116,555 realised for a similar quantity in the previous year, showing a deficiency of Rx. 1,026,357. The average price in 1897 was Rs. 1,048·12·3, as against Rs. 1,311·14·11 in 1896. Mr. O'Conor, in the "Review of the Trade of India for 1896–97," remarks on the embarrassed state of the opium trade caused by the stringency of the Indian money market, which induced a fall in prices, such fall in prices being further assisted by the increasing divergence between the Exchange value of the rupee and the tael.

9427. Is that all you have to say upon that point?—Yes.

9428. Then you know something of the jute mill industry in Bengal. Is it a large industry?—A very large and very important industry.

9429. You have something to say in regard to the effect of dear money on the working of jute mills?—Taking 6 per cent. as a fair charge for interest during the first six months in normal years, the average cost of money for the six months of 1898 was fully 11 per cent., giving an excess of 5 per cent. per annum for interest incurred on overdrafts against working stocks of jute held by the companies named below. The following statement in regard to some Calcutta jute mills, shows the six months' excess interest, and the per-centage this excess would represent in dividend per annum on the paid-up capital of the companies:—

Company.	Capital.	Bank Overdrafts.	Excess Interest incurred on Overdrafts for Half-year ending 30th June 1898.	Excess Interest represents following Dividend per Annum on Capital.
	Rs.	Rs.	Rs.	Per cent.
Kanknarrah	14,00,000	6,51,280	16,282	$2\frac{1}{3}$
Khardah	12,00,000	7,38,361	18,459	$3\frac{3}{4}$
Standard	10,00,000	5,80,237	14,505	$2\frac{2}{5}$
Union	9,00,000	10,46,680	26,167	$5\frac{4}{7}$
Seebpore	10,00,000	26,69,407	66,735	$13\frac{1}{8}$
Gowrepore	19,00,000	10,66,752	26,668	$2\frac{4}{5}$
Central	7,00,000	4,67,775	11,694	$2\frac{1}{2}$
Hooghly	33,60,000	22,46,151	56,153	$3\frac{1}{3}$
Alliance	11,00,000	8,63,453	21,586	$3\frac{9}{10}$

9430. That is all you have to say in regard to the jute mill industry?—Yes.

9431. (*Sir C. Crosthwaite*). I understand you hold that it is a good thing for a country to export as much as possible?—Certainly; undoubtedly for India, to export as much as possible. I understand you refer to India.

9432. I meant generally, first of all?—Certainly it is a good thing, and a most important thing for India that she should export largely.

9433. You do not look to the price of what is exported, it is the quantity?—Well, I hold this, that it is better to be able to export something at a low exchange than not to export anything, or to export a materially reduced quantity, at a higher exchange.

9434. But, if you can pay your debts with a smaller excess of exports over imports, that would be an advantage, you think?—Certainly.

9435. Now, do you think that the rate of exchange affects sterling prices? I think you said, with regard to tea, that supply and demand regulated the sterling prices?—I think that sterling prices are more or less regulated by supply and demand; that is the general rule.

9436. And with regard to the principal products of India for export, would you say that that was the general rule?—Certainly.

9437. Now, turning to the case of tea, do you think that the rise of the rate of exchange has damaged, or is likely to damage, the production of tea?—It will certainly damage it.

9438. I suppose you will admit that the quantity of tea that has been exported from India has so far continued to increase. I have the figures here up to 1896 of the total production of tea in India, and I see there has been a steady increase. For example, the exports in lbs. were in round numbers 132 millions in 1893; in 1896 they had risen to 156 millions?—Yes, I know the output of tea has gone on increasing from extensions that were carried out before the effect of the closing of the mints was felt.

9439. Anyhow, it has gone on increasing?—It has, but then ——

9440. So far, on your principles, certainly no harm has been done?—The harm is being done now, and the effect will be felt.

9441. But, so far as we have got the figures, the quantity exported, which you say is the main thing, has gone on increasing?—Because the effect of the rise of exchange was not felt on the industry; it is only within the last two years that that has been felt.

9442. What do you mean by the effect of the rise of exchange?—The effect in adding to the cost of production and lowering the rupee price of tea.

9443. I thought you said that the rupee cost of production had remained the same, that it had not been added to?—Yes, but in reply to Sir John Muir's question I said that it cost the companies that are financed from London more to lay down the rupees required to work their factories at an exchange of 1*s.* 4*d.* than would be required if they worked them at an exchange of 1*s.* 1*d.*

9444. What I mean is this. You say now that the disadvantage is in the cost of production being increased, and the rupee price lowered. But you must not say both those things. The cost in rupees

Mr. D. Cruickshank.

16 Nov. 1898.

has remained the same, has it not?—The rupees are the same, yes.

9445. Therefore, whatever loss there is, is confined to the reduction of the rupee price?—Yes, but it operates in different ways. In the case of English tea companies, financed in sterling, and where teas are sold in London, the effect of the higher exchange is shown in their accounts as adding to the cost of production, in consequence of the fewer rupees obtained for the money sent out to India to carry on their gardens. In the case of Indian tea companies, financed in rupees, and whose teas are sold in Calcutta, the effect of the higher exchange appears in the lower prices obtained for their teas. But the result is the same in both cases—a reduction in profits.

9446. I know it operates in different ways; but what I want you to admit is that you must not say that you are cut both ways?—Oh, no, I did not intend to say that. It reduces the returns to the producer.

9447. Practically it reduces your profits?—It reduces our profits.

9448. Because it costs you more to lay down the rupees which are wanted for production?—Yes.

(*Sir J. Muir.*) I am not quite sure that the witness exactly grasps your question.

(*Sir C. Crosthwaite.*) I think Mr. Cruickshank has grasped my question, but I will put it as plainly as I can.

9449. The rupee cost of production you admit has remained the same?—In rupees yes, about the same.

9450. But of the sterling price which you get in London, it costs you more to lay down those rupees in Ceylon or India?—Yes, it costs more to lay down.

(*Sir J. Muir.*) But I think the witness in reply to my question said it cost him more to obtain his rupees in Calcutta to pay his wages at an Exchange of 1*s.* 4*d.* than at a rate of 1*s.* 1*d.*

(*Witness.*) That is the same thing, I take it.

9451. (*Sir C. Crosthwaite.*) In your memorandum you say, "The effect of the present currency policy "of the Government of India, and of the further pro- "posals put forward, is to impose indirectly a heavy "tax upon exports, and to increase the cost of pro- "duction by raising the value of money." That means the cost of production in India, I presume?—Yes, it would tend to increase the cost of production.

9452. You also hold that there has been a great contraction of the currency owing to the closure of the mints?—The currency is insufficient for the requirements of trade.

9453. Has that shown itself in any lowering of prices, or not; have rupee prices fallen in India in consequence?—Rupee prices are falling in India.

9454. They are falling?—Yes.

9455. And you think they are falling in consequence partly or mainly—we cannot tell, I suppose, exactly how much is due to each cause—but you think the cause is partly the closing of the mints, and the consequent restriction of currency?—Certainly.

9456. The tendency of the Government policy is to raise the value of rupee money, and therefore to reduce, gradually or quickly, the price of produce?—Certainly.

9457. And, I suppose, with the price of produce, the rate of wages will also tend to fall?—I do not quite follow that.

9458. In a country like India, the food is the main thing, I suppose?—Yes. I think the tendency should be for wages to fall.

9459. Therefore, the tendency of the policy of the Government appears to me to be, on those principles, to reduce the cost of food and of labour. According to what you have said, the tendency is to lower the price of food, and as a consequence there is a tendency to reduce the wages of the labouring class?—But what benefit would it be to the labouring classes, when, as a matter of fact, they have smaller wages, and have only the same return in food?

9460. But, suppose in England bread was cheapening, and that the labourers and workmen and operatives were content to get less wages owing to the great cheapness of food, would an English manufacturer say that that was likely to increase the cost of his production?—No, it would tend to lessen the cost of production.

9461. In India, does not the same thing apply? I mean, supposing the value of money is being increased, is it not obvious that the tendency would be to lessen the cost of production *pro tanto*?—Well, you may lower prices to a point at which it would not be profitable to produce at all, as in the case of tea, and in the case of indigo.

9462. But, as I understand it, the sterling price of tea goes by supply and demand?—Yes.

9463. Now your cost of production with a high exchange was so much, and you admit that the tendency of the raising of the value of money by the Government policy will be to lower the price of labour and food; therefore the tendency would be for the cost of production, so far as it depends upon labour and food, to diminish, not to increase. Of course, I admit that things in India sometimes turn out very differently, but it seems to me that, given cheap labour and cheap food, the tendency of the currency policy advocated by the Government being, as you say, to raise the value of money and to lower prices—it seems to me that that must diminish the cost of production rather than otherwise?—Well, if it makes money dear, it adds to the cost of production, and we do not find that the artificial rise in the value of the rupee has diminished the cost of production in the case of tea and indigo. In England, notwithstanding the largely increased purchasing power of its gold currency, wages, I believe, have not fallen. Nor have they done so in India since the artificial rise in the value of the rupee.

9464. "Makes money dear" is a different phrase. What you said here was "raising the value of money." Money might be dear for the purpose of borrowing or getting large advances, and that might embarrass you, but it is quite a different thing from raising the value of money?—Probably that was not the correct expression. It might have been more correct to have said, dearness of money, because "value" might attach to the purchasing power of the rupee; whereas I meant the cost of money.

9465. Then you do not think that the Government policy will add to the purchasing power of the rupee?—It will, if it reduces prices—as it is doing.

9466. It will add to the purchasing power of the rupee?—Certainly.

9467. At the same time, you mean, it would make difficulties in getting advances of money in the money market?—Yes, it costs you more for any money you have to borrow.

9468. It raises the sterling value of the rupee; I suppose there is no doubt about that. If the closure of the mints has been ineffective, as some people say, and has not caused a contraction of the currency at all, then the charge which you bring against the Government of restricting the coinage by closing the mints falls to the ground, does it not—if there was no contraction of currency? Your case is that the Government by an arbitrary act has raised the sterling value of the rupee to 1*s.* 4*d.*?—Yes.

9469. I say that, as you hold that, you must admit that the contraction of the currency has had an effect—that the closure of the mints has had an effect?—It has certainly made money dear and stringent.

9470. And the effect has been to raise the sterling value of the rupee?—The sterling value, yes.

9471. Now, in the cost of production, certainly in the case of tea to some extent, and more largely I suppose in the case of cotton mills and jute mills, the price of European machinery and the cost of European supervision enter into the calculation, do they not?—To some small extent; in the case of tea, to a very small extent.

9472. In the case of tea, as I say it is to a small extent; in the case of mills, it is to a larger extent?—As regards their machinery, certainly.

9473. And as regards their European supervision?—Where that is paid in sterling, but not if it is paid in rupees.

9474. I suppose, even when it is paid in rupees, if the rupee is worth more sterling, you are likely to get English labour for less rupees than where it is worth less sterling?—English labour can be got on practically the same terms as it could 20 or 25 years ago, so far as supervision goes.

9475. It has not affected it?—It has not affected it.

9476. But the policy of raising the value of the rupee is not one which you would say tends to increase the cost of production of tea, or indigo, or cotton, or jute?—If you make money dear, it increases the cost of producing those articles.

9477. I am not talking of making money dear; I am talking of raising the sterling value of it?—I do not follow you quite.

9478. What I mean is this. You have to pay for European labour, and you have to pay for European machinery. The sterling value of the rupee enters more or less into the burden of those payments?—Certainly.

9479. I say more or less?—More or less—to a certain extent.

9480. Therefore, the higher the sterling value of the rupee, the less will be the cost of the machinery and of the European labour?—So far as it is paid for in sterling.

9481. The European labour, I should say, in any case, because the Englishman, so far as I know, looks more or less to the sterling value of what he is paid in; at least if he is a Government servant, or if we are engaging him for the Government, I know that that is so?—Yes, theoretically, that is quite correct.

9482. Therefore, what I want to ask you is this, looking to those facts, do you still maintain that the policy of the Government in raising the sterling value of the rupee is a policy which increases the cost of production?—Yes.

9483. You still maintain that?—Yes.

9484. Will you explain how?—Because what you stated as regards the sterling cost is a small item, comparatively, to the total outlay necessary for the production, say, of tea or indigo; it is relatively a small one.

9485. Will you say in what those outlays mainly consist?—Wages is the principal item in a tea garden.

9486. You have admitted that the tendency of the Government policy is not to increase the wages, but to decrease them?—(*Sir J. Muir.*) No, I do not think the witness has said that.

9487. (*Sir C. Crosthwaite.*) Yes, in rupees. You are going back now to the question of profits. Of course your sterling profits will be less if you have to pay more for your rupees; but what I say is that the cost of production in India cannot be raised, so far as I can see, by raising the value of the rupee?—Take the case of a tea garden. The cost of production will be increased if you add to the dearness of money; and the interest on the working capital required, if you have to pay 10 per cent. for it, instead of 7 or 8 per cent., will be an item which adds to the cost of producing the article. Now, you say, as I understand it, that as against that there is a saving in the lower price paid for machinery and other things obtained from England. That is so, but that item is a very small one. In the case of tea, I do not think over a series of years it amounts to more than 10 per cent. of the total outlay.

9488. This other item which you have brought forward, namely, the cost of procuring the loans which you want, or the money on your bills, to what do you attribute that increasing cost?—To the rise in exchange and the dearness of money.

9489. But is it due to the rise in exchange?—If I have to send out from this country 1,000*l.* to carry on a tea garden, and I can lay that money down at 1*s.* 1*d.* exchange, I get more rupees for it than if I laid it down at a 1*s.* 4*d.* exchange.

9490. But that is money that you send back from the proceeds of the sale of your tea?—Certainly it goes back in the shape of tea.

9491. I was questioning you as to what you say here as to "raising the value of money." When you talk of "the dearness of money," I understand you to mean that, to get your advances in Calcutta or Bombay or wherever it is, you would have to pay more?—Yes.

9492. You would have more interest and heavier discount?—Yes.

9493. To what do you attribute that heavier discount?—Scarcity of money.

9494. At present the whole thing is in a transition state, is it not?—Yes.

9495. But suppose that a gold standard was established firmly, and that people had confidence in it, that cause for the dearness of money would not exist, would it?—If the money went out. You must attract it out there.

9496. I suppose it will go out if there is confidence?—Money will only go out if it can be profitably employed, and, if you injure the industries in which European capital is employed, tea, indigo, and so on,—if you destroy them, and there is no prospect of a return to attract money, it will not go out.

9497. If you destroy them, those industries of course will not want money at all; but is it not begging the question to say that they will be destroyed?—You may so injure them that they will not attract capital for investment in them.

9498. So far as we know at present, the industries are going on?—They are going on certainly, but their prosperity is being seriously affected.

9499. Now I will come to the remarks which you quote from a letter from the Government of India of the 16th September 1897, which, as quoted by you, would seem to be very much against any raising of the sterling value of the rupee?—Beyond 1*s.* 4*d.*, yes.

9500. Can you tell me what was the subject of the letter from which you have quoted those remarks?—I believe it was in connexion with the proposals put forward by the French and American Governments.

9501. In connexion with the proposals for an international agreement to establish bi-metallism, was it not?—I understand so, or something of that kind.

9502. Can you tell me what the ratio was which France and America proposed?—No, I cannot.

9503. The Government of India's remarks were directed, were they not, against attempting to raise the rupee to 2*s.*?—Against raising it above 1*s.* 4*d.* as I understand it. They indicate their own opinions in the passage that I have quoted. The Government say in that despatch, "that the true interests of India "demand that any measures for attaining stability in "the rate of exchange between gold and silver should "be based upon a rate not greatly differing from "16*d.* the rupee, and that any measure which would "raise the rupee materially higher than that level "involves great dangers."

9504. Quite so, but in the quotation that you have made, beginning "pressed as we have been" and so on, what I want to know is whether those remarks were made with reference to raising the rupee to 1*s.* 4*d.* or a trifle over, or were they made with reference to raising the rupee materially higher?—I should say with reference to raising it materially higher. They say themselves, "which would raise the rupee materially "higher than that level."

9505. The proposal before them was to raise it to what?—That I do not know.

9506. At present, they propose to put it at 1*s.* 4*d.* do they not?—Yes.

9507. Therefore, is it fair to quote these remarks of the Government of India, with reference to their present proposals?—I think it is quite fair. I have gone on to say, "the same objections must be held to "apply to the rate of 1*s.* 4*d.*, if such rate is higher "than that required by the conditions of trade."

9508. You say, the same objections apply. Would they apply in equal degree?—Not in equal degree

Mr. D. Cruickshank.

16 Nov. 1898.

certainly—the effect would be greater if the rate was made 1*s.* 6*d.* or higher.

9509. Do you think that the exports from India have as a matter of fact been affected by rises and falls in exchange? Have you looked into the figures? Have you examined year by year the exports to see whether there is any visible connexion between the amount of the exports and the exchange of the year? —I have not gone into the figures lately; but what I hold is that a low exchange stimulates exports from India by enabling the products of India to be laid down cheaper in other countries.

9510. What I wish to ask you is whether the facts and figures of the trade confirm it?—I have not got the figures before me.

9511. If you will refer to No. 1 of our Statistical Tables ("Exports of merchandise &c., 1850–51 to 1897–98") the figures show, do they not, that there has been a practically steady increase year by year in the exports?—Yes, as exchange fell.

9512. With slight variations that always occur in trade, sometimes up and sometimes down?—Yes, until within the last two years.

9513. But do you see any obvious relation between the exchange of the year and the increase or decrease of exports?—I see in 1897–98, which is the year in which latterly exchange was highest, exports had fallen off.

9514. That was the year of famine and plague?—And also in 1896–97.

9515. Had famine affected trade in 1896–97?—To some extent possibly.

9516. Not to its full extent, but to some extent?—Yes.

9517. Look, for example, at 1890–91, when the exchange was 1*s.* 6·089*d.*; and again go up to 1888–89, when the exchange was 1*s.* 4·379*d.* In 1888–89 you had a smaller export with 1*s.* 4*d.* than you had in 1891 with 1*s.* 6*d.*?—You cannot take one year exactly with another, because there were special influences at work.

9518. But do you see anything that would lead one to deduce a law that the exports must vary with the exchange; in other words that the exchange is such a factor as to override the other causes?—The exchange is a very material factor in enabling India to compete with other countries in laying down its products.

9519. I am not contesting the theory: what I want to know is, do the facts bear out that theory?—On the whole they do.

9520. You think so?—I think so. There may have been influences at work in some years that modified the effect of the low exchange, but on the whole I consider they do.

9521. That is to say, when the facts were against the theory, you would hold that there were some influences at work?—Some influences at work.

9522. And, when they are in favour of the theory, you would hold that there were no influences at work?—Not at all. I think these figures might have been submitted with some explanations. I saw an article in the *Economist* the other day, pointing out that the mass of figures recently given in these returns were given without any information or explanation to enable you to arrive at any definite conclusions as to their effect.

9523. I do not see how we can expect anyone to explain them. Of course you can invent explanations, but there is the broad fact that the trade goes on increasing. Now, with reference to the causes that might increase the trade, do you think that the exchange is as great a factor as the improvement of communications by railways and by the Suez Canal?—They all help, of course, but it is impossible to say to what extent and in what proportion each contributes.

9524. For example, there has been, and there is, I believe, this year, a great export of wheat from the Punjab. The distance from the wheat-producing districts of the Punjab to the sea is, I suppose you would say, roughly, from 1,200 to 1,500 miles?—Yes.

9525. Now, suppose that there were no railways, would any exchange have got that wheat out of the Punjab? Supposing that there were neither railways nor the Suez Canal, do you think the wheat, no matter what it sold at, could have been brought down in country carts and on bullocks?—Probably not. I quite recognise that railways in India have helped to increase exports.

9526. And that, from some of the largest exporting districts, there could have been no export without these means of communication?—Certainly.

9527. No matter what the exchange was—at least within reasonable limits; of course if there had been a bounty or anything of that sort, it might have come out. Do you know Central India at all?—No, I have only passed through it; but I have here a statement, if you are interested in the exports of wheat, that will show you the various causes that bear upon it (*see Appendix*).

9528. That shows the prices of wheat?—It shows the exports, and it shows the exchange; and it shows the rates of freight.

9529. Take the years 1893, 1894, and 1895. There was a small export of wheat in those years?—The figures are there. The smallest of all was last year, 1897. Of course that is exceptional.

9530. Practically there was no wheat to export then, or rather it was too dear ——?—But it gives there the sterling price, which has also an effect on exports. India competes with other countries. If other countries have a full crop, and are able to lay down their wheat at lower prices in Europe, naturally that affects India's capacity for exporting.

9531. When the exchange in 1894 was less than 1*s.* 1*d.*, or about 1*s.* 1*d.*, and there were only about 700,000 tons exported from India —— ?—The sterling price is given there.

9532. Therefore we might, by re-opening the mints, drop the rupee to 1*s.* or less, and yet, owing to other causes, we might not get any greater export of wheat?—It depends on the cost of production in other countries.

9533. But you cannot say that the lowering of the rupee by the re-opening of the mints will necessarily increase exports?—It will enable India to compete more advantageously with other countries than with a 1*s.* 4*d.* rupee.

9534. But it will not necessarily increase exports?—If other countries can reduce the cost of production to a corresponding extent, it will not.

9535. Now I think you said that silver prices in India had ruled pretty steady?—That is my general opinion.

9536. But have you examined that opinion by the light of tables of prices?—I have tables here, and I have examined them. Of course there have been fluctuations in prices.

9537. You know that this opinion has been contested by some, for instance, by Mr. Atkinson. Have you seen his tables of prices?—I have not seen those. In connexion with that, this paper that I have here shows that wheat in Calcutta, with exchange at 1*s.* 10¾*d.*, in 1873–74 sold at 3 rupees 1 anna; in 1894, with exchange at about the lowest point, wheat was sold at 2 rupees 12 annas; so that the purchasing power of the rupee had not fallen with regard to wheat in 21 years.

9538. That was in Calcutta?—In Calcutta.

9539. But the price in Calcutta or Bombay would be greatly influenced, would it not, by the cheapness of communication from up-country? There is not much wheat grown, I take it, about Calcutta?—No.

9540. Nor about Bombay?—No; but the cheapness of communication has not very much fallen in that time. The railway charge for the carriage of wheat from Cawnpore, for instance, to Calcutta, has fallen in the last few years, but not much. In 1888, the rate was Rs. 53 per 100 maunds, but it has since been reduced to Rs. 47.14.8 per 100 maunds.

9541. With reference to the price of other food grains, would you say that they had not increased; in price?—I say that they have been more equalised that is to say, in places where formerly, through the absence of communication, the prices were exceptionally low, they have been raised to a level with other districts.

9542. At places that were land-locked, where prices were very low, they have been raised?—Yes.

9543. But, on the whole, would you maintain that there has been no rise?—On the whole, my opinion is that the purchasing power of the rupee up to the time of the closing of the mints, as I have said, has not materially changed.

9544. I have here a table showing the variations in the retail prices of seven food grains from 1861, in which the price of 1873 is taken at 100. This table shows that since 1873 down to 1893 there was a very considerable rise?—That is in retail prices. There has been a rise in certain parts of the country, but, as regards the matter of exchange, I think the prices of export articles have more to be taken into account.

9545. And at the seaports?—Yes, but prices in the interior must be lower than at the seaports, allowing for the cost of carriage——

9546. But I ask whether you would contest these tables, or whether you would admit that the prices of food grains have risen?—I do not contest the tables, because I have no means of seeing whether they are accurate or not. But I have other tables showing the prices of rice and salt and wheat in different parts of India, and, certainly, at the ports of export they do not show any great variation in price.

9547. When you advocate the re-opening of the mints, I think you take it for granted, or as pretty nearly a matter of certainty, that prices would rise?—I have not advocated the re-opening of the mints.

9548. That is quite true. I am mistaken; you have not advocated the re-opening of the mints. In the quotation you have given from Mr. O'Conor's evidence you have inferred that prices have not risen?—That the purchasing power of the rupee has not generally fallen throughout India.

9549. Owing to the low exchange; I mean, during this period of low exchange the purchasing power of the rupee has not fallen?—Has not generally fallen.

9550. But, when you are advocating a lower rate of exchange than 1*s.* 4*d.*, you appear to me to assume that the purchasing power of the rupee will fall?—Eventually I believe it would have fallen, had the mints remained open.

9551. And you tell us that that fall will enable the country to bear more burdens of taxation than it now has to bear?—No. You will notice that I said this: "I should have expected, if exchange had remained at "about the lowest point to which it fell in 1894, "say, between 1*s.* and 1s. 1*d.*, that the tendency "would have been for the purchasing power of the "rupee to fall, and, presuming this to be the case, the "natural level of exchange required by conditions of "trade would approximate to that point." So long as the purchasing power of the rupee does not fall, India continues to benefit by the low exchange in the matter of export; or, so long as the purchasing power of the rupee in relation to commodities in India does not fall, India is put in a better position to compete with other countries by a low exchange.

9552. I think in another place you said that the low exchange enabled the exporter to give higher prices to the ryot?—I never said so.

9553. Then you do not hold that the ryot has gained anything hitherto by the fall in exchange?—He is enabled to produce more: that is to say, he is enabled to grow more, and, owing to being able to export more, he gets in some districts higher prices for his products. The ryots generally have benefited by being able to produce and export more, rupee prices not having fallen.

9554. You mean by increasing the area cultivated?—Yes.

9555. But not by getting higher prices?—No, I should not say by getting higher prices.

9556. Because you think prices have not risen?—They have not risen—not materially.

9557. Supposing that we allow the rupee to fall still lower, by fixing a lower ratio or other means, on what grounds can you expect that the ryot will get any higher prices than he gets now, or do you anticipate that he will get higher prices? I gather that you think it will come on in time?—As regards articles exported from India, the rupee prices depend more or less on the sterling prices; and the view I hold of the matter is that, the lower the exchange is, the better India is enabled to compete with other countries that produce similar commodities in supplying the requirements of Europe. If the range of sterling prices is such that she can do so, and give higher prices to the ryot, of course the ryot gets the benefit. If the range of sterling prices is such that she can merely compete on the level of rupee prices, the ryot would not get any benefit.

9558. He would get the present price?—Yes.

9559. And still the product would go into the market at a cheaper sterling cost?—Yes.

9560. But do you not think that that process would bring down sterling prices?—Sterling prices do not depend altogether on the exports of India; they depend on the production of other countries as well, which compete with India.

9561. Then if the amount which should be added to the exports by this means were not sufficient to meet the debt, it would be necessary to reduce the sterling price of Indian produce?—It might have that effect.

9562. Now there are one or two questions I should like to ask you about the effect which you say the high exchange has had on indigo. Of late years, and for a good many years past, have not the natives come into competition with the large European indigo factories by establishing small factories of their own?—Do you mean in Behar?

9563. I cannot speak of Behar, but I know that in the North-Western Provinces a great many small indigo factories have been established?—Yes.

9564. Is it not the case in Behar too?—Not in Behar, I think. The indigo industry in Behar is principally in the hands of Europeans. In the North-West it is almost entirely in the hands of the natives. When it pays them to grow indigo there, they grow it; when it does not pay to grow it, and prices are low, they stop growing it.

9565. But that competition has brought down the prices, has it not?—It is a different class of indigo altogether. It goes to America largely.

9566. (*Sir F. Mowatt.*) So far as it goes to America, does it stand in the place of the European indigo that before went to America?—There are certain qualities of indigo taken for Europe. The finest of all indigo goes to Russia, and they take higher priced indigo than would be required for England or America. Russia and France take the finest indigo, and pay the highest prices for it. In America they take principally Oudh indigo—the North-West indigo.

9567. Taking the commoner sort of indigo that goes to America, was that in the hands of Europeans before the natives began to grow it?—No, it is grown principally in the North-West; it is almost entirely in the hands of the natives.

9568. It has not affected the European trade?—Well, of course, the larger the crop is, the more effect it has on prices.

9569. (*Sir C. Crosthwaite.*) With regard to your remarks about beet sugar, I understand you to say that a high exchange favours the import of beet sugar?—Yes.

9570. And that has caused a fall in the local prices?—Yes.

9571. If it has caused a fall in the local prices—I dare say you are right—I ask you to explain how it also gives the importer into India of beet sugar a

Mr. D. Cruickshank.

16 Nov. 1898.

higher price?—I did not say that he got a higher price.

9572. I understand you to say that the high exchange enables the importer to come in? — Yes, because it enables him to lay down cheaper in India.

9573. How does it enable the importer to come in, unless he gets a higher price?—It enables him to lay down cheaper in India, in the same way that a low exchange enables an exporter from India to lay down his product at a lower price in Europe.

9574. But you say at the same time it tends to lower the local price?—Yes.

9575. I have no doubt you are right, but I cannot understand, if it has lowered the local price, how it has given the importer a higher price?—It has not given him a higher price, it has only given him a lower laying down cost in India.

9576. Then I suppose the diminution in price has not been enough to swamp the advantage that he got?—No.

9577. Will you kindly look at what you said about salt, and the quotation that you make from the Calcutta *Englishman* with regard to the falling off of the salt revenue, and the increased imports of European salt favoured by the higher exchange. Are not those remarks of the Calcutta *Englishman* made entirely with regard to the salt revenue of the province of Bengal?—Apparently so. I gave the extract as it is, merely to point out how the exchange operates in favouring the importation of foreign salt into India.

9578. When they say that the "salt revenue last "year showed a decrease amounting to 1·9 per "cent.," that refers merely to the salt revenue of the Bengal province?—I cannot give you any further informatiom about the salt trade than I have put down here.

9579. They say, "The decrease is attributed to "smaller clearances owing to the famine, and to a "marked falling off owing to reduced sales of salt at "the Government factories in Orissa. The opening "of the East Coast Railway has facilitated the import "of Ganjam salt on a larger scale and at smaller "cost." Ganjam salt is not seaborne salt?—I believe not. I am not familiar with the salt trade at all.

9580. I think you may take it from me that Ganjam salt is salt manufactured in Ganjam, in the Madras Presidency, and therefore exchange cannot have affected it in the least?—But the importation of foreign salt has affected it.

9581. They say, "The result of this increased "importation was to send down the prices of salt, "and to check the sale of crushed salt in favour "of the Liverpool and Hamburg article"—that is to say, it affected the Aden salt in favour of the Liverpool and Hamburg salt, but that substitution of one foreign salt for another foreign salt would not affect the salt revenue in any way?—It might affect the production of salt in India, if importation increased to a very large extent.

9582. If it displaced the home-made salt, yes, but the duty is collected on all salt, is it not?—But is it of benefit to India to injure one of her industries?

9583. Of course it is not to her benefit if that industry is injured, but, in what you have quoted, is there any evidence that the native salt industry of India has been affected?—This is all I can give you, and you can draw your own conclusions from it.

9584. I think you did not put forward any specific proposals as to the modes of taxation to be adopted?—No.

9585. Nor did you express an opinion as to the amount that it may be necessary to raise?—No—if it is necessary to raise anything extra at all.

9586. (*Sir A. Dent.*) You gave us a short time ago your views about the wheat trade, and how it was affected by exchange, and tables were referred to showing how the export varies from year to year from various causes. Now wheat is an annual, and that same argument would not apply to tea at all?—No.

9587. As the tea production must be exported to the United Kingdom or the colonies?—Yes.

9588. Then the effect of this exchange last year has been to check the extension of tea, you say?—It has.

9589. In your opinion, is that check to extension altogether a great blow to the tea trade as a whole?—In what respect?

9590. If tea is being produced at the same rate as it has been during the last 10 or 15 years, are you not afraid that there may be no market for it? There must be a check in some form, must there not, otherwise, by producing so much, the price will be brought down to such a level that the production will cease to pay?—There comes in the question of supply and demand. Of course, if you produce more than can be consumed, the prices will naturally fall, and production will be checked.

9591. But the consumption of tea is not quite the same as the consumption of wheat?—I understood that you were referring to tea.

9592. Yes. An argument that might apply to wheat, which might be put to many uses, would not apply to tea, which has only one use?—In the case of wheat, if sterling prices fell so low that it could not be laid down profitably from India, the production of wheat would naturally decrease, and, being an annual, some other crop would be substituted for it.

9593. Wheat can be used for other purposes—if it cannot be made into bread, animals may consume it; whereas only a certain section of the world drink tea. My question is, is it a great blow to the trade as a whole, that the large production of tea has had a check through this rise of exchange?—I think it is a blow to the country that one of its principal exports should be checked.

9594. Have not you heard amongst your many friends who grow tea, that some of them think that this rise of exchange is rather a blessing than otherwise, because it checks production?—Some people seem to think so.

9595. You have heard that said?—I have heard that said.

9596. One gentleman, the other day, said he thought it would be a good thing if exchange went up to 1*s.* 6*d.*?—It would not necessarily follow. The natural effect of curtailing production would be to curtail consumption; that is, if it had the effect of raising sterling prices. Now the sterling price of tea has fallen, and this has led to increased consumption. If the sterling price were raised by curtailing production, the effect might be to curtail consumption also, and there would be no benefit, while an opening would be given for the cheaper China tea to come into use more largely again.

9597. In regard to the Indian and Ceylon tea trade, do you anticipate any great competition from China?—Mr. Cameron, in reply to question 8382, has stated: "The competition of China will go on increasing year "by year. As we have seen already, during the last "10 years the trade has increased very largely, and I "should look for that increase going on; but it is only, "perhaps, as you say, in the course of a generation "that it will increase by leaps and bounds." In my note I say, "Mr. Cameron's views as to the increased "competition to be expected from China are supported "by recent reports from Her Majesty's Consuls in "that country, as shown by the following extracts." I can read the extracts; they are embodied in consular reports, which are published and available.

Extract from Diplomatic and Consular Reports, No. 2156, July 1898. Shanghai.

"*Black Tea.*—Nearly the whole of the first crop was as usual sold at Hankow. The Shanghai season opened towards the end of June, but little business was done until August, when the rapid decline in the value of silver, alluded to above, enabled buyers to lay down their purchases cheaply on the London and New York markets. The increase in the amount of settlements compared with last year's (69,000 against

46,000 half-chests) is no indication of the trade returning to Shanghai, but an accidental occurrence, owing to violent fluctuations in exchange and freight. The result to foreign buyers has been on the whole fairly satisfactory. The second and third crops amounted to 75,000 and 61,000 half-chests respectively, against 61,000 and 15,500 half-chests for the previous season. The increase in the third crop shows the wonderful elasticity in possible supplies, when prices rise a little above the bare costs of production.

"An interesting incident in the past season was the experimental use at Wenchow of a machine roller, which proved beyond doubt that the most ordinary China tea is capable of astonishing improvments if treated by modern methods. Wenchow tea made by the old native process is of the most inferior description, but, by being carefully made and machine rolled, a very fair drinkable tea resulted.

"A company under the auspices of the Commissioner of Customs at Hankow, Mr. R. B. Moorhead, is being formed to experiment in this line in the Hupeh tea districts, the safety of men and machines being guaranteed by Imperial edict. A somewhat similar company is already working in Foochow, and has, I understand, had some measure of success. It is now enlarging its operations.

"The Chinese Government appears at last to be awakening to the fact that the tea trade is rapidly slipping away from their country, and there are signs that it will be willing to make some concessions to encourage measures for the improvement of the tea produced. A very efficient and feasible way would be to grant facilities to foreigners to take up land in the tea districts, so as to introduce more careful cultivation of the plant, and to offer a premium in the shape of a large reduction in duty on tea prepared by modern methods. The wisdom of such a course would appear obvious, for, if the measures for tea improvement were crowned with success, the revenue would soon recoup itself for the reduced duty by increased export, while, in the event of failure, the revenue would simply revert to its present footing."

Extract from No. 2072, *May* 1898. *Foochow.*

"The export of tea in 1897 was nearly 16,000,000 lbs. below that of 1896, but the earthquakes in Assam, the appreciation of the rupee, the small output of Foochow teas, and a local combination not to flood the home markets precipitately, tended to make the season not unprofitable.

"Some of the old faults of Foochow teas appear to have been eradicated; such as mixing the leaf of the old season with that of the new, or introducing an excessive proportion of dust; and the native firing of the teas is very highly spoken of, and is, I am assured, on a par with that of Ceylon. But none of the new methods of preparing teas appear to have proved a complete success. Hand-rolled teas are said to have been a failure, and shade-dried teas are not well spoken of except in a few small parcels, where the quality was excellent and would command very high prices.

"The establishment of the Foochow Tea Improvement Company, Limited, may do something to improve the conditions of the trade. It will doubtless give foreigners and Cantonese a more personal interest in the plantations, and an improvement in the company's gardens is likely to induce the natives to pay more attention to their own. The only plantation at present owned by the company is at Doon Ling, about 15 miles from Foochow, and already it is found in the neighbourhood that teas are picked with more care, and leaf is at last being bought directly from the producer without any middleman's charges. Further, the yield of the old shrubs on the company's estate is found, now that they are properly manured, to be surprisingly large.

"The company has recently been reconstituted with a capital of over 70,000 dollars, and now proposes to experiment with plants raised from Indian seed, in order to compete directly with Indian teas; but freight, wages, and taxation, are three items which are likely to handicap the company adversely.

"The local government regards the company not unfavourably, and itself is making an effort to restore the tea trade by reducing the likin charges. The reduction is intended also to benefit the provincial government, which is apprehensive that teas may be brought down under the transit pass, the duties under which would be paid to the central Government. The proposed reduction is nominally 4 mace (about 1*s.* 2*d.*) per 100 catties, but the manipulation which weights undergo at likin stations prevents these figures being of much value. The intention, as I am assured by the officials, is to underbid transit dues, and, if this is carried into effect, the likin charges must be under 1 tael 25 c. (about 3*s.* 9*d.*) per picul."

Extract from No. 2156, *July* 1898. *Shanghai.*

"*Cotton Goods.*—Nine large cotton-spinning factories were running at the close of the year with 290,000 spindles. Additional spindles will shortly be erected, to the number of another 100,000. The labour employed is principally female, and, with the sudden demand, wages have been forced up enormously, the supply of skilled hands being naturally unequal to the demand. Wages, which began at 20 c. (4½*d.*) per day, rose to 30 c. (6½*d.*), but have since gone down again, as the supply increased, to 25 c. (5½*d.*).

"In spite of this difficuity, the mills have already paid small dividends, and, it is believed, have good prospects before them. When in full working, the existing mills should produce about 240,000 bales of 400 lbs. per annum. To meet the demand for raw cotton, large areas in the neighbourhood are being put under this crop.

"China cotton, though apparently dearer than Indian or American, has certain advantages which fully compensate for its higher price. In the first place, it takes the dye very much better than other kinds, and consequently the yarn spun commands better prices. In the second place, though about 13 per cent. dearer than Indian cotton on the spot, Shanghai cotton is much cleaner, and the loss in weight, which is 12 per cent. on American and 13 to 16 per cent. on Indian, is less than 10 per cent. on Shanghai cotton. This is due to the nature of the soil here, which is alluvial instead of being sandy. Moreover, Chinese cotton can be worked on one machine less than Indian or American, which is so much saving on working expenses. The staple is somewhat short, 20's being the extreme limit for which it can be used."

Extract from No. 2059, *April* 1898. *Chungking.*

"Indian yarn is the one object of foreign import which has firmly and generally established itself all over the province in the face of rising prices. Contrary to what might have been expected, the greatly increased import of raw cotton (chiefly from Chekiang and Kiangsu) has had no prejudicial effect, and this yarn has risen by 3,000,000 lbs. Prices have varied from 101 to 81 taels per bale. But the large increase of Chinese and Japanese yarns is especially worthy of note. With a rising rupee, India will compete with these yarns at a disadvantage, and Chinese yarns have a further advantage in lighter taxation. Foreign imports for the interior have to pay tariff duty plus one-half for transit dues or native likin, while the product of the steam mills at Shanghai only pays tariff duty, and is then entitled to a free pass all over the province. The yarns produced by the Hankow mills are also growing in favour, they are sent by the Yang-tze under transit pass and do not come within the cognizance of the Chunking customs. Large quantities of the same yarns are sent from Hankow into Kuei Chou *viâ* the Tung Ting Lake and the Yüan River. Particulars of this trade must be sought in the Hankow reports. Hitherto the Indian article has been more plentiful and of superior quality, but the output of Chinese yarn is now rapidly increasing, and, instead of being confined to local markets, is seeking for distribution in the western provinces."

Mr. D. Cruickshank.

16 Nov. 1898.

The future of manufacture by Western methods in China is a subject of the utmost importance to every Englishman. The following facts and opinions may help experts to a judgment:—

Extract from No. 458, May 1898. Central and Southern China.

"In regard to wages, employers in China are at a great advantage. The wages of an adult man on the lower Yang-tze for a day of 12 hours, for, say, 320 days in the year, in such industries as native hand-weaving and dyeing, average, at the present gold price of silver, 10*s.* to 12*s.* a month, all included. Wages may be expected to rise somewhat in the future for the more skilled classes of labour, as the number actually efficient must be limited, at least until the system of apprenticeship, which is universal in China, has had time to take root in regard to the new industry; but any great change in the level of wages amongst the plain workers must be very slow, as the operatives will have pressing upon them the mass of millions of cheap workers with just as good capacity as themselves—unless, indeed, manufacture is congested in one place, and labour allowed to get into the power of Chinese middlemen. The truth is that a man of good physical and intellectual qualities, regarded merely as an economical factor, is turned out cheaper by the Chinese than by any other race; he is deficient in the higher moral qualities, individual trustworthiness, public spirit, sense of duty, and active courage, a group of qualities perhaps best represented in our language by the word manliness, but in the humbler moral qualities of patience, mental and physical, and perseverance in labour, he is unrivalled. Physically, he is a hard man—I am speaking of the labouring class—far from an Asiatic, as we use that word in English.

"It seems probable that, under the leadership of skilled European managers and foremen, of character and temper, firm, just, and reasonable, the Chinese coolie and his wife will make excellent textile factory hands. European superintendence is essential, precisely because of their moral short-comings above stated. Judged by our standards we must pronounce all organisations in China (with a few exceptions noted in Secs. 34 and 36) above the family and the small business partnership to be hopeless failures. The upper class seem to lack the moral tone to carry on big enterprises; indeed the laws and the courts of justice are wanting as well as the men.

"Still, here, these millions of patient, reasonable workers are only wanting leaders to make them producers on a gigantic scale, and leaders they will most certainly find. Whatever the future in politics of China may be, here these workers must remain; and they are, in my opinion, destined to modify profoundly the condition of the world's industries.

"To return to cotton manufacture, all Western employers and overseers of Chinese agree that they excel in lightness and deftness of hand, and that they are suited in physique and intelligence for work in cotton mills. They show extraordinary powers of endurance; for instance, boys in the Hankow mill work through the whole night without leaving the mill, and with only a little rice congee by way of food. There may be temporary difficulties with labour. The Chinese have always practised a form of strike against bad government, directed at the officials, by ceasing to do business, shutting their shops, &c.; but we hear little of combinations of workmen directed against employers, probably because these latter are many, scattered, and in a small way. It is probable that workmen employed in cotton mills will combine, but there is in China a dreadful poverty of the masses, due to rapid increase of population, wherever a district has been spared rebellion and famine for a few tens of years, and nothing can keep up the wages of common labour, which must remain, under the present system, close on starvation point.

"In regard to land, the lower Yang-tze Valley is as perfect a site for manufacturing industries as can anywhere be found, with coal and iron in easy reach, a temperate climate, and good means of communication by water.

"In regard to capital, the third agent besides land and labour in production, the Chinese have not sufficient to develop their country, even with the present backward methods of industry; and interest is accordingly very high. The country does not now produce the precious metals to any extent; and the Chinese have, it is believed, no more of silver and copper than is required for the ordinary circulation; but they are likely to get ample capital for enterprises under foreign management from abroad, and there is no more promising field for the investment of English capital; no English money has been lost in China through the act of the Chinese Government, and little in any other way than by bad business."

9598. Do you think Mr. Cameron's remarks apply particularly to tea?—No.

9599. If you refer to his answer 8388, you will see that he rather meant that it should not apply to tea?—I see what he says there.

9600. Anyhow, whether Mr. Cameron's remarks apply to tea or not, it is the fact, is it not, that the supply of China tea that is taken in the United Kingdom has enormously decreased?—Enormously decreased, yes.

9601. As shown in the tables which Sir James Mackay gives, and which are published on page 18 of Part I. of our Evidence, it has gone from 143 million lbs. in 1884 down to 35 million lbs. in 1896?—The decrease is very large, but China still exports a large amount of tea to America, where it competes with Indian and Ceylon tea.

9602. Then you are still afraid that China might eventually interfere with the Indian and Ceylon trade?—Well, the capacity of China as a tea-producing country remains to be seen. It has materials, according to the reports submitted to Her Majesty's Government, for almost limitless production.

9603. It is said, I believe, in one place that China only exports one-twentieth of her production?—I do not know how that is.

9604. Anyhow the amount of tea that China exports is very small, compared with what she uses in the country, where the whole population drinks tea? No doubt.

9605. Now about the jute mills, to which you refer. You gave us a table in which the amount of the bank overdrafts is shown, and the excess of interest which had to be paid in consequence of those overdrafts reduced the dividends of the companies by $2\frac{1}{2}$ per cent., and up to as much as 13 per cent.?—It is stated, "The excess interest represents the following "dividend on the capital of the company."

9606. My only question with regard to that is rather for information than anything else. Have these companies any working capital?—Most of them, I think, work almost entirely on borrowed capital, and they have to hold very large stocks of jute and manufactured goods, and these bank overdrafts are taken from their figures.

9607. Then are we to understand that it answers their purpose better to get overdrafts from the bank than to call up additional capital from their shareholders?—So far, it has answered their purpose better, while money was cheap.

9608. (*Mr. Campbell.*) As regards the effect of exchange on tea, as to which Sir Charles Crosthwaite put some questions to you, taking the sterling price realised for the tea, the exchange affects all that portion of it which has to be remitted out to India to be expended there?—Yes.

9609. It is only those portions of the proceeds which are spent in England which are not affected by the exchange?—Certainly.

9610. Can you tell me what the proportion between the two is: what per-centage the one bears to the other?—Taking it over a series of years, it is about

10 per cent., I think; that is to say, that represents about the cost of the stores and other things that have to be procured from England for the working of tea gardens.

9611. So that, if that is the case, exchange affects 90 per cent. of the total proceeds of the tea?—Yes, about that.

9612. Now, as regards the lower cost of production to which Sir Charles Crosthwaite alluded, caused by the rise in exchange, have you found that you get your coolie labour much cheaper than you did three years ago?—No.

9613. Any cheaper?—No cheaper.

9614. In the last three years exchange has risen to something about 1*s.* 3½*d.* a rupee?—Yes.

9615. That is close on 30 per cent.?—Yes.

9616. So that you have been prejudiced to the extent of 30 per cent., and you say you have no advantage in the shape of cheaper labour at all?—No, none.

9617. Do you consider the present exports of tea from India to be any criterion of the present prosperity of the industry?—None whatever.

9618. The larger exports which have been referred to, are the result, are they not, of extensions which were made when exchange was at a lower level?—Yes.

9619. It is only three or four years hence that the effect of the exchange in checking production will make itself apparent?—Yes.

9620. Now, as regards the effect of exchange on exports and imports, you admit, of course, that exchange is not the only factor in increasing or decreasing exports?—It is not the only factor.

9621. There are markets, and prices, and crops, and demand, all to take into consideration?—Yes, and cost of transport.

9622. A large crop may produce large export, whatever the rate of exchange is?—Yes, it might.

9623. If a country grows a very large crop of anything more than it can use, it will export it, whatever the rate of exchange may be?—Yes.

9624. And, on your theory, a large export would actually lead to a higher exchange?—Yes, the effect would be to raise exchange.

9625. Allusion has been made to the year 1890-91 as an instance of large exports when exchange was comparatively high. Are you aware that that year was the year when there was a Russian famine, and a great failure of the Russian wheat crop?—I was not aware of that.

9626. And that that led to a very large increase in the price of wheat, and a consequent very large increase in the exports of wheat from India?—From the figures I have, the price of wheat in England in 1890 was from 33*s.* to 34*s.*; in 1891, 36*s.* to 38*s.*; and in 1892, 30*s.* to 32*s.* Since then it has been always lower, until this year, when, owing to exceptional causes, the price rose very considerably.

9627. You contend that a low exchange gives a higher rupee price, provided the sterling prices remains the same?—Yes.

9628. And I think it has been brought out—in fact you replied yourself—that India is not the only country that determines sterling prices?—Certainly it is not.

9629. There are some remarks in your memorandum as to prices and markets adjusting themselves to exchange. Do you take it they would so adjust themselves?—Well, a high exchange would lead to contraction; and a lower exchange would lead to expansion.

9630. A high exchange would lead to contraction of what?—Of production.

9631. And to a checking of exports?—Yes.

9632. Low exchange, on the other hand, would lead to an expansion of exports?—Yes.

9633. And checking of imports?—Not necessarily; because the price of imports depends on the sterling price of the commodities. Take, for instance, the case of cotton. Cotton is lower now than ever it was before, and Manchester is able to produce cotton goods at a smaller cost, which enables her, even with a low exchange, to go on importing largely into India; but of course the tendency is for low exchange to check imports.

9634. Then would you say that the tendency of a high or a forced exchange on trade would be towards establishing more and more of an equilibrium between imports and exports?—Certainly it would check exports and encourage imports.

9635. It would, in fact, diminish the balance of trade?—It would diminish the balance of trade.

9636. And thereby diminish India's power of paying her foreign debt?—Certainly.

9637. I see that, in the memorandum from the Chamber of Commerce which you put in, they allude to high exchange as an important factor in the increased import of sugar into India?—Yes.

9638. They allude there to a proposed remedy; what was the remedy?—I believe the remedy was an increased import duty.

9639. A countervailing duty?—A countervailing increased import duty.

9640. Are you aware whether the Government have taken any action on that report?—The Government have taken action. They took steps to be represented at the Brussels Conference; one of their officers was appointed to go there on behalf of the Government of India; and I see from a telegram to the *Times* last week that they have ordered local inquiries to be made by the provincial Governments as to the effect of these imports of beet sugar on the cane production in India.

9641. So that the matter is engaging the attention of the Government of India?—Yes.

9642. Now, as regards Chinese competition with India, it is not only in tea that China is likely to compete with India. Is it not the case that China is a large competitor with India in the production of cotton goods?—Yes. I will read an extract from the Shanghai Consular Report of July, 1898: "Nine "large cotton-spinning factories were running at the "close of the year, with 290,000 spindles. Additional "spindles will shortly be erected to the number of "100,000. The labour employed is principally "female, and with the sudden demand wages have "been forced up enormously, the supply of skilled "hands being naturally unequal to the demand. "Wages, which began at 20 c. (4½*d.*) per day, rose "to 30 c. (6½*d.*), but have since gone down again, as "the supply increased, to 25 c. (5½*d.*). In spite of "this difficulty, the mills have already paid small "dividends, and, it is believed, have good prospects "before them. When in full working, the existing "mills should produce about 240,000 bales of 400 "lbs. per annum. To meet the demand for raw "cotton, large areas in the neighbourhood are being "put under this crop. China cotton, though appa-"rently dearer than Indian or American, has certain "advantages which fully compensate for its higher "price. In the first place, it takes the dye very "much better than other kinds, and consequently "the yarn spun commands better prices. In the "second place, though about 13 per cent. dearer "than Indian cotton on the spot, Shanghai cotton is "much cleaner, and the loss in weight, which is 12 "per cent. on American, and 13 to 16 per cent. on "Indian, is less than 10 per cent. on Shanghai "cotton. This is due to the nature of the soil here, "which is alluvial instead of being sandy. More-"over, China cotton can be worked on one machine "less than Indian or American, which is so much "saving on working expenses. The staple is some-"what short, 20's being the extreme limit for which "it can be used."

9643. The China mills have hitherto used Indian cotton very largely, have they not?—Indian cotton and Indian yarn.

9644. And to the extent to which they use Indian grown cotton, for instance, is it the case that the China manufacturer is in no better position for production

Mr. D. Cruickshank.

16 Nov. 1898.

than the Indian competitor by the fall in China exchange? I mean this. Is it not the case that the Chinese buyer of Indian cotton has to suffer a loss in remitting to India for the purchase of the cotton, equal to the loss sustained by the Indian manufacturer in selling his goods in China?—Yes, I should think they equalise each other.

9645. But would not a different aspect be given to the question if China were to begin to produce her own cotton on such a scale as to enable her to dispense with the Indian article?—Certainly, and that is what she is going to do, apparently.

9646. I see from one of the consular reports that the area of cotton-growing in China is being largely increased?—Yes.

9647. You make a suggestion that the exchange should be fixed at 1*s.* 2*d.* instead of 1*s.* 4*d.*, and you give your reasons fully as to that suggestion, which I will not go into now. You have put them on record, I think, already. Then, allusion was made to some of the other schemes that have been put forward—the Lindsay scheme for instance, which aims at establishing a ratio of 1*s.* 4*d.* Did I understand you rightly to say that, in your opinion, if that is a proper and a natural ratio, no artificial support should be necessary?—Yes, certainly.

9648. And, if it is not a proper and a suitable ratio, you consider it a mistake to attempt to force it upon India by artificial means?—Most certainly.

9649. Mr. Lindsay's scheme is 1*s.* 4*d.* If that is not a natural ratio, would it not be a mistake to attempt to force it upon India by artificial means?—Yes, I think so.

9650. You say that no special measures for acquiring gold would be necessary; that is to say, gold would flow in by the operations of trade?—Yes.

9651. (*Sir J. Muir.*) There is a vast difference between 1*s.* 2*d.* and 1*s.* 4*d.*, so far as the trade of the country is concerned?—The question to my mind is, what rate will the conditions of trade make effective. I hold that trade will not make 1*s.* 4*d.* effective, and it might make 1*s.* 2*d.* effective; and I say further that, as regards the reduction of the rate from 1*s.* 4*d.*, the railway and land revenue will increase by the stimulus given to the export trade; and it is better to have an increased revenue from expanding trade than to increase the taxation. Then there is one other point I might mention. It seems to be supposed that, if you establish a stable exchange between England and India, capital will flow out to India; but I say that capital will only be attracted to India if it can be profitably employed there; and, if the effect of any measures adopted by Government is to injure the industries of India, capital will certainly not be put into them.

9652. (*Mr. Le Marchant.*) Has there been any marked change in the conditions of the production of indigo in India in recent years?—We had three large crops of indigo in the three years preceding the last two years, which has affected sterling prices.

9653. Has there been a tendency in sterling prices for some years to droop, compared with the prices of, say, 12 years ago?—Yes, certainly, there has been a tendency in sterling prices to fall. There has been a tendency in all gold prices to fall in recent years. Partly that may be due to the appreciation of gold.

9654. But is it not the case that indigo fell away somewhat rapidly in price?—I can give you the prices of good consuming Bengal indigo since 1881. In 1881 the price of indigo was 6*s.* 9*d.* per lb.; that is good consuming Bengal indigo. In 1882 6*s.* 6*d.*; in 1896, 4*s.* 3*d.*; in 1897, 4*s.*

9655. I think there was a corresponding fall in other indigo?—I have not the prices here for other descriptions, but the sterling prices of all classes of indigo have fallen.

9656. Would you attribute that to any cause especially affecting indigo? Have the inferior qualities tended to supplant the superior qualities, and reduced the demand for them?—The finest indigo, as I say, goes to Russia and France; it does not come to England.

9657. Is it not the case that discoveries in the process of dyeing have enabled the inferior qualities to be used to a greater extent than formerly?—Well, dyers in this country are, I think, going in more for the cheaper indigos.

9658. And that would tend to lower the average price, would it not?—Certainly.

9659. Would you consider that the area of use for indigo was limited?—Yes.

9660. And that any supersession of the natural indigo by artificial would have consequently a more marked effect?—Certainly.

9661. It has been suggested, I think, that artificial indigo may be very much reduced in cost of production and price; that is an apprehension?—That is an apprehension, yes.

9662. Supposing you have a constantly cheaper price at which a competitive article can be placed upon the market, do you think it would be a wise thing to endeavour to meet that by a lower rate of exchange?—A lower rate of exchange would enable the Indian product to be supplied at a lower cost.

9663. For the time being; but if the cost were still further reduced in Germany?—Well, it would become a case of which could survive.

9664. But you think the method of lowering exchange is a reasonable way of meeting the greater competition?—Lowering exchange benefits all products in India that compete with those of other countries. I do not quite follow you. Do you mean to say that it would be desirable for the Government to go on lowering exchange——.

9665. I understand your suggestion to be that a lower rate of exchange, by enabling Indian indigo to be laid down more cheaply in London, would be a desirable mode of meeting German competition?—It would be an effective mode of meeting it for the time being. I have stated that I think there is a limit to the benefit from the fall of exchange. As soon as the rupee depreciates in relation to the volume of commodities in India, it will cease.

9666. Then you would wish exchange to be such that the rupee price of indigo should remain without alteration, not that it should rise?—I do not want the rupee price of indigo to fall by an artificial rise of exchange or an artificial value given to the rupee.

9667. Then what would be the effect of lowering exchange? Would it not be to maintain the rupee prices of indigo?—Yes, or increase them. The rupee prices of indigo have been lowered by the rise in exchange.

9668. What would be the limit to the advantage of lowering exchange?—When the purchasing power of the rupee generally in relation to commodities falls, as it might have done had the mints remained open.

9669. In fact you would not wish to see higher rupee prices generally in India?—Well, rupee prices have been lowered by raising exchange. As to certain commodities—indigo for instance, which competes, say, with the artificial dye and with indigo from other parts of the world—I should like to see the price of it rise; or, to put it in another way, I do not approve of the rupee prices of Indian products being lowered by an artificial rise in the value of the rupee. The action of the Government in India has raised exchange and has lowered the rupee value of indigo, but it has not affected the sterling price, which is regulated by the supply and demand and competition with other countries.

9670. Guatemala indigo is much less in the market now, is it not?—I am not acquainted with that.

9671. But that indigo has not been affected by currency at all?—I am not acquainted with these currencies.

9672. You mention in your paper the competition of cheap cotton from the United States?—Yes.

9673. Was that cheapness of production owing to the general conditions of production in the United States?

—I believe so. I have quoted a reference to that: "A reference appeared in one of the daily papers last "week to the unprecedented cheapness of raw cotton "at the present time, and in explanation of same it "was stated that an exhaustive report, furnished by "bankers in the Southern States of America, estimates "that in most sections the cost of production is only "about one-half what it was 10 years ago, the pre-"sent price—five cents a pound at port of loading—"yielding consequently about the same profit as "double the price did a decade back." The general conditions, apparently, of production are such that cotton can now be produced at about half the cost that it could formerly.

9674. That is in a gold-using country?—Yes.

9675. Would lowering exchange (or depreciating the currency) be a satisfactory way of meeting that competition?—Well, I hold that the low exchange enables India to compete better with a country where the cost of production is lower.

9676. In the two cases, the causes of low prices are different?—It is all a matter of the cost of production. If the United States can produce cotton at half the cost that it could 10 years ago, it is in a better position to compete for the supply of cotton to the world than it was before. India, on the other hand, by the raising of exchange, is put at a disadvantage in that competition.

9677. Would a low exchange be in the long run the most effective means of meeting the difficulty?—It is a means of meeting competition.

9678. If the United States were still further to cheapen the production of cotton, what then?—Then it is a case of competition—which could supply it cheapest.

9679. In fact, the method of meeting it by low exchange would extend up to a certain point, and no more?—Exactly.

9680. Is it your opinion that rupee prices have fallen?—They have fallen within this last year. Up to the time of the closing of the mints, or probably a little later, the purchasing power of the rupee had not materially changed. That is the conclusion I have come to. Rupee prices are now falling, according to the reports that we have.

9681. Has your attention been directed to the Government tables giving the result of prices taken in the aggregate?—This is the latest information I have. It is set out in my memorandum, but may I read this extract from the "Review of the Trade of India in 1897–98"? "The prices quoted for rice and wheat "are at the end of the period of scarcity, and hence "the great decline, but the average price last year for "both was higher than in 1896–97. All the other "commodities mentioned in the table also show a "marked fall in price."

(*Mr. O'Conor.*) That is alluding to the prices of exports at a port. In the table I supplied I have given the prices of grains in the interior of the country.

(*Witness.*) I am speaking of the prices of exports, which are the only ones affected by exchange.

9682. (*Mr. Le Marchant.*) You were saying that rupee prices, at all events of certain commodities in certain places, have fallen?—Yes, they have lately.

9683. And you attribute that to the closing of the mints?—Yes, or the rise in exchange. It is borne out by Mr. Finlay in his evidence. He said they quite expected there would be a fall in prices from the closing of the mints. I have quoted from one of his answers: I say, "It is contended, as "the reason for adhering to an exchange of 1*s.* 4*d.*, "that prices have adjusted themselves to that rate "(Mr. Arthur, 2,033), and it is stated that trade will "adjust itself to any rate (Mr. Finlay, 3,039), rupee "prices falling as exchange rises;" that is what Mr. Finlay says.

9684. Would not that mean general rupee prices—rupee prices throughout the country?—The prices obtained for articles exported affect, to a more or less extent, the prices ruling throughout the country.

9685. But do you find that they have affected them in such a way as to produce a general fall?—This book, "The Review of the Trade of India in 1897–98," is the latest information I have on the subject. Of course the conditions of the last two years were abnormal, and can hardly be taken as a criterion of the normal state of affairs in India.

9686. I think that is eliminated in our tables?

(*Mr. O'Conor.*) Yes. This table of prices here has reference to the level of prices in 1873; and the general rise of prices in India may be taken as anything between 7 and 30 per cent. Those are the prices of the seven principal food grains, taken from a very large number of districts, from the year 1873.

9687. (*Mr. Le Marchant.*) Now, comparing 1873 generally with June 1896, the figures which I have before me, and which go over the whole ground, show a rise in the index number from 700 to 1,000, in round figures?—Yes. There is not much variation if you go back to 1876, 1880, 1891, 1892, and 1893; then there was a rise in prices in 1894–95.

9688. Would that be so, if you took the periods of three years and averaged them? In the earlier years are not the numbers, as a rule, lower?—You have got here 1897 and 1898. There was an increase of prices in 1897, and a fall again in 1898.

(*Mr. O'Conor.*) 1897 was the famine year.

(*Witness.*) Quite so.

9689. (*Mr. Le Marchant.*) But the other intermediate years are at a lower figure?—Well, there may have been some special reason for it. That is not explained.

9690. Or there may have been special reasons for the higher years?—Yes.

(*Mr. O'Conor.*) The higher years include the years of the great famine, 1876 and 1877.

9691. (*Mr. Le Marchant.*) In referring to the Government statistics, you quoted a remark that no explanations are given of this great mass of figures?—I was referring to an article I saw in the *Economist*, in which they said they had tried to analyse the figures, and they complained that the figures were not very clear.

9692. In the statistical returns of the English Board of Trade, are there any explanations or comments given?—I do not know at all.

9693. In the Government publication from which you are reading, are there not comments and explanations?—In the "Review of the Trade of India" some explanations are given.

9694. So that anyone who wishes can find there whatever explanations the Government can give?—If they searched for them, certain explanations would be forthcoming.

9695. The explanations take up a considerable portion of the page, I think? Now, with regard to an expression towards the close of your memorandum where you speak of a "natural exchange," you allude to the lowest point to which exchange fell in 1892, and then you appear to infer that the natural level would be one that approximated to that?—That is my belief. I have not got very satisfactory figures to go upon, but I think the indications tend to show that that was about the natural level.

9696. Why is the level more natural at that particular time, when exchange fell, than in other years?—Because it is the exchange required by the conditions of trade.

9697. Of that time?—For instance, I have said that I do not think the conditions of trade will maintain an exchange of 1*s.* 4*d.*, whereas it might more easily maintain an exchange of 1*s.* 3*d.*, and might more easily still maintain an exchange of 1*s.* 2*d.* The position of India, as I look upon it, is quite exceptional in this respect; that it has a large foreign indebtedness which it must meet by its exports, and to enable it to meet that debt it must continue to export large quantities of produce in excess of what it imports; therefore, if you check the exports, you affect India's ability to pay its indebtedness.

Mr. D. Crnickshank.
16 Nov. 1898.

9698. And you think the imports would be materially increased by a rate of 1*s.* 4*d.*, instead of 1*d.* or 2*d.* lower?—Certainly.

9699. Would that be owing to India having command of more sterling in England with which to buy imports?—No; there would be an equilibrium; that is to say, India could only buy to the extent that she exported; and, if the imports were cheapened, there would naturally be an increase of volume, and she would probably not be able to export produce sufficient to meet her debt.

9700. How would those additional imports be paid for?—By the exports.

9701. But I think you were saying that the sterling proceeds of those exports would be rather less, if anything, than more?—I do not quite follow you.

9702. I thought your view was that at a rate of, say, 1*s.* 4*d.* the exports would be less than at a lower rate?—Yes.

9703. So that, unless there were a change in sterling price, there would be less sterling at the command of India to buy with?—Yes, and therefore she would import less.

9704. But I understood you to say that India would import more?—She could not import more than she could pay for, but she might import as much as she exported, and leave no balance over.

9705. The payments by the public for imports, and the payments by the Government on account of home charges, are all ultimately made out of the sterling proceeds of exports?—Yes.

9706. And there is a certain competition between the Government and the public for the command of so much of those sterling proceeds as each may require?—Yes.

9707. And we may exclude from consideration the mechanism of exchange, and say that the Government buys, and pays rupees for, one part of the sterling value which is at the command of India, and the public buys, and pays rupees for, the other part?—Yes.

9708. In principle, would not the process be the same, whatever the rate of exchange?—Well, there would be competition between, say, the Government and the commodities imported into India; in other words, the exchange which the Government would have to accept might be very much lower.

9709. I am excluding that consideration for the moment. The process would be the same at any rate of exchange?—The Secretary of State competes with importers of commodities into India, and the effect of that competition would be that, if there were not sufficient exports to pay for both, either imports would have to fall in price, or the Government would have to accept lower rates of exchange for their bills.

9710. But I wish to ascertain why people who wish to import into India should have greater advantage in competing with the Government at, say, 1*s.* 4*d.*, than at 1*s.* 2*d.*?—A greater advantage?

9711. The assumption that imports would displace Council bills, means that the public who import would obtain command of a greater proportion than before of the sterling proceeds of exports in London?—From the higher rate of exchange, importers into India derive a benefit in the laying-down cost of their goods. It cheapens the goods in the laid-down cost in India.

9712. Are you taking rupee prices in India as remaining the same, or as tending to be reduced by the restriction of the currency? If the rupee price of imported goods fell in India, would not that tend to counterbalance the rise of exchange and leave things very much *in statu quo*?—Supposing the cost of an article imported into India in sterling is 100*l.*, and exchange is 1*s.* 4*d.*, that article can be laid down in India at less cost at 1*s.* 4*d.* than it could be at, say, 1*s.*, because the rupee price would be lower, and it would depend upon how far the rupee price fell, as regards the quantity of that article that would be imported into India, or how long its importation could go on.

9713. And the tendency of the rupee price to fall would, to that extent, counteract the tendency of imports to increase owing to a rise of exchange?—Yes, certainly.

9714. Now, comparing the position of the Government with that of the public, if we assume that rupee prices are to some extent lower, would not the rupees with which anyone in India contemplated paying for imports have cost him more—or, in other words, would not the consumer in India have fewer rupees to spend?—He might have fewer rupees; but, take the country as a whole, the country as a whole must pay for imports by means of exports. If it has had fewer rupees for the quantity exported it will have less available to pay for imports.

9715. I was rather dealing with the difference between the position of the Government and that of the purchaser of imports?—It is not a question of the purchaser of imports, it is a question of the exporter from England of commodities. The question lies between him and the Government in selling its exchange bills.

9716. I thought we started by assuming that there was a certain amount of sterling proceeds of exports available in London?—Yes.

9717. And the question was, why should the Government be at a greater disadvantage in obtaining command of a portion of that at 1*s.* 4*d.* than at 1*s.* 2*d.*?—Because the commodities have to compete with the Government; that is to say, the imports can be laid down in India at a lower cost with an exchange of 1*s.* 4*d.* than with an exchange, say, of 1*s.* 1*d.* Therefore, to that extent, the Government suffers in its competition with commodities.

9718. If the rupee rises in sterling value through the supply of currency being less, relatively to the work it has to perform, will not that condition affect rupee prices generally and thus remove the special advantage which importers might otherwise derive from a high exchange?—Yes, rupee prices generally would be affected, but, as regards importers, the high exchange will make up to them for the lower rupee price, while as regards exporters the high exchange will reduce the rupee prices paid for exportable products, thereby tending to diminish exports, until the competition between importers and the Government for the proceeds of the reduced exports leads to the fall in exchange required to restore exports again to the necessary volume.

The witness withdrew.

Mr. Merwanjee Rustomjee.

MR. MERWANJEE RUSTOMJEE called and examined.

9719. (*Sir A. Dent.*) You represent the Bombay Native Shares, Stocks, and Exchange Brokers' Association?—Yes.

9720. What is your business?—I am a Parsee broker and partner in the firm of Messrs. Merwanjee and Byramjee, dealing in exchange, finance, bullion, and Government securities.

9721. How long have you been in business?—For the last 35 years.

9722. Were you in favour of the closing of the mints in 1893?—I was against the closure of the mints.

9723. Will you give us your reasons for that?—I was personally opposed to the closure of the mints, on the fundamental assumption that India was prospering under the free silver currency, and trade and industry were in a thriving condition. The best answer against the closure was the then existing

prosperous condition of India. There were, no doubt, difficulties in the way of Government to meet the fall of Exchange in respect of their own remittances, but a large majority of the Natives thought that was not a sufficient reason for the closure, and I was much afraid of an adverse effect on the cotton mills, owing to an expected fall in the price of silver and stringency of money.

9724. What, in your opinion, has been the effect of closing the mints?—Government set before them deliberately the task in June 1893, to produce scarcity of money by closing the mints and to reach the goal of 1*s*.4d. exchange, and to maintain it there, so that the public might pour gold into their treasuries, and take rupees from them. This is the object with which they acted as they did, and the question is, have they succeeded? The most favourable circumstances one can imagine as helping that object have come into play since the end of 1896. They incurred heavy expenditure for famine and war, they curtailed their council drawings, and even bought rupees in London to the extent of Rx.1,000,000. The result was that Rx.359,381 worth of gold was tendered to the treasuries. Mercantile credit has been shaken a good deal from January to March 1898, money rose to an unprecedentedly high rate of interest, ranging from 13 per cent. to 24 per cent. per annum on best securities, and that was its current value for some time, although the Bank of Bombay rate was nominally at 13 per cent.; and when all these circumstances, which have caused a great deal of distress to the country, have not been sufficient to pour gold into the country, the question is whether it is wise to persevere in the experiment, I mean the experiment of continuing the stringency or increasing it.

9725. What have you to say as to the currency proposals of the Government of India?—The Government of India evidently believe, to judge from their proposal of March 3rd, 1898, that they will succeed in getting gold by taking further measures to create stringency of money. The plain meaning of the proposal is, in a famishing money market, irrespective of manifold miseries inflicted on trade and Government credit already, to starve it further by drawing Rx. 12,000,000 from public circulation. This is an absurd proposition, and that it has taken the mercantile and banking community of India by surprise is a matter of public notoriety, and I need not enlarge upon it. To withdraw Rx. 12,000,000 in times when Government practically fail to float their own loan successfully of Rx. 1,200,000, when the municipality of Bombay and Port Trust of Bombay have entirely failed to raise their small loans, although the latter offered half per cent. better rate of interest than on its previous loan, and although they are open to accept a reasonable price, when the mills and other industries pay a fixed rate of 8 per cent. to 10 per cent. for 12 months' finance against 5 per cent. to 6 per cent. in previous years—when we plainly see all these serious results of the stringency of money, how can we still further persevere in the direction of tightening the screw and throttling the trade and industry of the country? In the third paragraph of its despatch of the 3rd March 1898, the Government says:—"The average annual "addition to the currency when the mints were "open was about Rx. 7,000,000, of which, how-"ever, a part only, perhaps half, was a permanent "addition, an amount equivalent to the remainder "being removed from the circulation prin-"cipally for the purpose of conversion into "silver ornaments." The meaning of this Government estimate is that Rx. 3,500,000 of currency were added every year to the existing coinage for the necessities of India. If the country were left to automatic currency, it would absorb every year Rx. 3,500,000 of fresh coin to supply its needs. The mint being closed in June 1893, the currency starvation to the country in the five years has been to the extent of Rx. 17,500,000, less about Rx. 2,000,000 coined for the banks immediately after the closure, and Rx. 2,000,000 received from the Currency Department: the deficit has been, in the matter of fresh coinage, Rx. 13,500,000, which alone would have kept the circulation to its normal condition. In the event of the Government of India proposal being carried out, the deficiency would amount to Rx. 33,000,000, and what would be the effect on the country, on its trade and industry, to what extent prices would fall and interest rise, one is at a loss to know, and why all this infliction of misery on the previously happy condition of the country should be brought about.

9726. Can you lay any evidence before the Committee with regard to the stringency prevailing in the beginning of this year?—The stringency of the money market from January 1898 to March 1898 in Bombay, when I was present on the spot, was so severe that it was impossible to sell Government paper or get advances upon it. Our firm was repeatedly asked by a firm of undoubted standing, trading with England and China and other parts of the world, to get advances on Government paper. This firm was always holding more than Rx. 100,000 worth of Government paper for the purpose of raising money whenever it required it. But we were unable to negotiate assistance for them; we did get them the money at times, but on condition of repayment within two or three days, and very often the banks confessed that they were unable to lend owing to want of cash in hand to spare for the purpose. This is a most serious inconvenience to trade. The firm in question, if they had got money, could buy produce or advance to their constituents to facilitate trade. The result of such tightness, it can be easily imagined, would block trade; exports would be slow to move; and importers would find it hard to meet their obligations. There is a large business done by brokers for exchange banks and presidency banks in Government paper for a short settlement ahead, and the brokers avoided as much as possible executing such orders, and requested the banks not to sell paper for delivery on one fixed day, as they could not guarantee payment, and, in fact, portions of such settlements were postponed beyond due date, as nobody would buy Government paper or advance upon it. With Government paper in such a predicament, one can easily realise how difficult it would be to sell other securities. Holders of shares and municipal bonds and other first-class securities could not either sell or raise money on their securities. It was a terrible state of affairs, and would be intolerable in London for a day. I state this at length to point out to the Committee the considerations on which I base my opposition to the Government proposals of March 3rd, 1898. A glaring illustration of the far reaching hardships resulting to India from the stringency of money is furnished by the recent failure of the Municipality of Bombay to float a loan of 29 lakhs at 4 per cent. interest. The municipality has always commanded nearly as good credit as Government paper, and the failure to float its loan is due to the experience of the stringency of money for the last two years, augmented by plague expenditure. Government are unable from the same cause, more or less, to help the municipality. Thus the most urgent works, such as sanitary measures on a large scale, and the improvement of the drainage and dwellings of the poor, which are the crying necessity of Bombay, run the risk of being indefinitely postponed,—to the great danger of the health of the people. I might forecast a similar fate awaiting the new project for the improvement of the City of Bombay, which is passed by Government as an important measure for the health of the people. There is the City of Bombay Improvement Trust started by the Bombay Government to beautify the city and to put it in a sanitary condition, but, unless they could raise money, they could do nothing.

9727. Now, was the stringency of the money market such as to require, in your opinion, measures of relief?—Yes. Whilst on this subject I would suggest that, until the Currency Committee has evolved some scheme of currency or suggested remedial measures, the one urgent step that ought to be forth-

Mr. Merwanjee Rustomjee. 16 Nov. 1898

with [illegible] recommended to the Government of India is, that during the busy season, viz., January to June, the Government should help the trade as much as possible by putting a portion of the public money at the service of the trade. It should be the settled policy of the Government to maintain a very high credit for its paper.

9728. Are you in favour of establishing an effective gold standard for India?—Yes.

9729. At what rate the rupee?—I am personally in favour of a ratio of 1*s.* 2*d.*, and I will give you my reasons for it. It is advantageous to the trade in opium and yarn with China, and other Indian trades competing with silver countries. It will facilitate the reopening of the mints if deemed advisable ultimately, as it will reduce the difference between the gold price of silver and the gold price of the rupee. It will also be favourable to the establishment of a gold standard, as the public will have to pay Rs. 17·2 instead of Rs. 15, to get a sovereign, and thus the owner of a sovereign will get Rs. 17·2 instead of Rs. 15. These are my reasons for reducing the ratio—that, even if you came to a gold standard, it will be better for the country; and, if you returned to a silver standard, it is good for the country to reduce the ratio from 1*s.* 4*d.* to 1*s.* 2*d.*

9730. You favour a gold currency?—Yes.

9731. Could it be established by the Indian Government?—Yes. My view is that Government should open to free coinage either of silver or of gold. I say gold for preference, because, now that the country has suffered so much from the closing of the mints, it is better to go on towards an effective gold currency, if possible. I am a believer in gold currency in active circulation with Imperial guarantee and assistance, or, failing that, in the reopening of the mints to silver. It is time now the Imperial Government came forward to assist India in this policy of establishing a gold standard, which, however, she is incapable of undertaking on her own responsibility, as it involves indefinite liability. If I were asked why Great Britain should come forward to help India in this matter, my reply is that the currency question of India does not relate merely to that country, but that the credit of Great Britain is intertwined with the solvency of India. As against that, what is a guarantee of 50 millions sterling to England for the sake of India? This is a question for statesmen to answer, and I need not do any more than point to it here, and merely remark that such a measure on the part of Great Britain would make the union which binds India to England inseparable for ever. My idea is that, on obtaining the Imperial guarantee, the Indian mints should be opened to the free coinage of gold at a ratio of 1*s.* 2*d.*, convertibility of rupees not to be guaranteed until Government has collected sufficient gold. Immediate coinage of gold will relieve stringency and help the trade of the country.

9732. Now, what are your views as regards the reopening of the mints to silver?—I submit it as an alternative measure from myself and not the Association. Failing an effective gold standard, I am in favour of reopening the mints to silver, and in support of my views I would point out what were the trade and revenue figures from 1872 downwards to 1893:—The exports, including treasure, in 1872–73 were about Rx. 56½ millions. The exports including treasure in 1892–93 were about Rx. 113½ millions. The Government revenue in 1876–77 was Rx. 58⅓ millions. The Government Revenue in 1892–93 was Rx. 90 millions. The price of English bar silver in 1872–73 was 59*d.* to 60*d.* The price of English bar silver in 1892–93 averaged 37*d.* Silver fell in 20 years from 59*d.* to 37*d.* or by 22*d.* per oz., and export trade expanded from Rx. 56½ millions to Rx. 113½ millions or an increase of Rx. 57 millions. Revenue expended from Rx. 58⅓ millions in 1876–77 to Rx. 90 millions in 1892–93; in 16 years, an increase of Rx. 31⅓ millions. These figures, no doubt, point to great prosperity of the country during the time when silver was falling. I do not mean to attribute the prosperity to the fall of silver alone, but this much can be said with certainty, that the fall did not hamper or check the development and prosperity of the country, or the expansion of the Government revenue. The circumstances were not grave enough to prevent Government from meeting the charge for exchange. In 1872–73 it paid Rx. 743,000 as charge for exchange. In 1892–93 it paid Rx. 10,070,000 as charge for exchange, nearly Rx. 9,000,000 more, whilst the revenue increased Rx. 31,500,000 in 16 years. The fact stands out clearly that the country and the Government were flourishing during the time the fall of silver was going on, and Government were quite able to pay their way. What we have seriously to consider is this question. Now, if it is an established fact that the country prospered under the open mint system, and, if Government were able to meet the loss in Exchange, is it safe and warranted by past experience to reopen the mints in future? It would conduce to the continued progress and prosperity of the country.

9733. Then, if the rupee fell in the way you indicate, how would you propose to enable the Government to meet its obligations?—Such a loss can either be met by a saving in expenditure, or by fresh taxation, or both, and I would suggest that a committee should be appointed by the Government of India to consider these points in detail. A mixed committee of Englishmen and Natives combined would carry with it the confidence of the country.

9734. Are you prepared for the fall of the rupee to a lower figure than 10*d.*?—The Government should meet the circumstances as they arise, as they met them in the past. In 1887 and 1888 the Secretary of State drew 14,628,540*l.* at 1*s.* 4·927*d.*, realising Rx. 20,817,667. In 1895 and 1896 he drew 18,742,216*l.* at 1*s.* 1·597*d.*, realising Rx. 33,080,876. The charge for Exchange in 1887 and 1888 was Rx. 6,135,127, the charge for Exchange in 1895 and 1896 was Rx. 14,338,660. A difference of Rx. 8,203,533 has been met by Goverment in eight years without resorting to any unbearable taxation, and it is reasonable to suppose that Exchange will not go under 10*d.* at once on the opening of the mints.

9735. What are your views as regards a duty on silver, or prohibiting the import of silver into India?—India has been a great absorber of gold and silver for generations past. The innate desire to import silver into the country continues unabated after the closure of mints, and it is now importing as much silver, if not more, as it did before the closure of the mints for its general use. The Government of India has been very wise hitherto in not interfering with this habit of the people; and, in spite of all advice to the contrary, have not increased the import duty on silver nor checked its importation in other ways. Gold and silver ornaments are regarded as a source of happiness by the people of India. Silver is now a commodity as much as any other imported into India, and the Government has no more right to deprive the people of their liberty to enjoy the possession and use of this great factor of their happiness, than they have to interfere with other commodities. The prohibition of silver importations into India would cause the people to become discontented. Any increased import duty on silver would seriously injure her mill industry, which finds a market in China, and likewise all her industries which have to compete with silver currency countries. My view is that the present policy of leaving silver alone is the best, and it meets with the wants and wishes of the vast population of India. Leaving the rich alone, to the poor of India the possession of silver is not only a great luxury, but it is a sort of bank to put their savings in. Would it be wise to deprive the poor man of the power of buying silver, or to depreciate further that which he possesses? The Government of India after the closure of the mint have not tampered further with silver. But, in its despatch of 3rd March 1898, it proposes to melt Rx. 20,000,000 and sell the metal for the price of Rx. 12,000,000. Such a process would obviously cause great depreciation of silver in India and at the same time in England. Now, the question is:—Can the

Indian mills which find a market in China for their production stand any further strain, which will be caused by such a depreciation?

9736. How does the price of silver affect the Bombay mills?—The fall of gold price of silver in London has an adverse effect on Exchange between India and China, if gold price of the rupee does not fall in the same proportion, and the fall is all the greater when there is a rise in the gold price of the rupee and a fall in the gold price of silver at the same time. Let me point out how the mills are faring in their China Exchange since the closure of the mints. 1893–94, 197 average rate in August for 100 dollars. 1894–95, 197 average rate in August for 100 dollars. 1895–96, 199 average rate in August for 100 dollars. 1896–97, 186 average rate in August for 100 dollars. 1897–98, 143 average rate in August for 100 dollars. On the 2nd July 1897, bar silver in London was $27\frac{9}{16}d.$ and China Exchange $159\frac{1}{2}$, on 27th August 1897, silver fell to $23\frac{3}{4}d.$, and China Exchange went down to 133. Average of silver for three years, 1893–95, was $29d.$, and Exchange in India on London was $1s.\ 1\frac{7}{8}d.$ for the same time. Average of silver in 1898 is $27d.$ in London, and the price of India Exchange on London $1s.\ 3\frac{7}{8}d.$ There is a fall of $2d.$ in silver in London, and at the same time a rise of $2d.$ per rupee in Exchange, resulting in a fall of 20 per cent. in China Exchange. These falls in Exchange inflict a great loss on merchants trading with China, and such downward fluctuations do great harm to mill industries, with the prosperity of which the prosperity of Bombay is bound up in a great measure. Serious loss of money is inflicted on merchants having trade relations with China, and they suffer in their credit when there is a sudden and great fall of silver in England. There can be no doubt of the hostility of these merchants, if they find that such loss is deliberately inflicted upon them by the Government of India, if they carry out their policy of March 3rd 1898. The mill industry of India is threatened with great competition by China and Japan. Japan already competes largely, and China is going to erect mills on a large scale in the near future. The Indian mills have thus the prospect of a severe rivalry to face. The industry deserves every favourable consideration at the hands of Government with such dark prospects before it. It is an industry which, since the ruin which overtook Bombay at the end of the American War in 1865, has been its mainstay, and has enabled the city to retain its prominent position both as a centre of industry and in respect of the public-spirited generosity of its citizens. I respectfully submit that the Committee bound to take into its most anxious consideration the danger that may accrue to that industry by any decision it might arrive at antagonistic to its interests. It has been argued that cheap silver would make China rich, and she will be able to give higher price for Indian yarn. This argument will not avail in future, as China is going to manufacture its own yarn. With this prospect in view, and considering that between the tea and mill industries Rx. 50 millions are invested, it behoves Government to protect those industries against the further depreciation of silver, which would strike at their very root. Already the mill industry is passing through very gloomy times. There are heavy stocks of yarn in China remaining unsold, and the general body of mills is only just able to make both ends meet, and some are even said to be working at a loss, in proof of which I will read an extract from the market report of the *Times of India Overland Weekly Edition*, 6th August 1898:—"The mill industry is still in a bad way, "and is passing through a very severe crisis, "owing to the very depressed state of the yarn "market in China. Things are really going from "bad to worse. Never before were such bad "times witnessed, not even during the Franco-"Chinese wars, the Russian scare, or the legislation "of 1893, which by the closing of the mints gave a "severe blow to the industry. Most of the mills are "now working at a loss, some of them manage to live "from hand to mouth, and only a few work at a small "margin of profit. How long such gloomy times are "going to last cannot be imagined. Our energetic "millowners, who in former years, when circum-"stances were adverse to the industry, caused a "great stir and entered into certain movements with "the view to remedy the evil, have of late taken no "interest in this all important matter. Why do they "not unanimously agree to close the mills for two "days in the week, as they did before? This short "time movement, if carried, will in some measure "curtail production, and what is more, control labour, "which is at present a very disturbing and annoying "element in the management of mills. Surely it is "high time now that some measures be adopted." In the report of the Committee on Indian Currency of 1893, at paragraph 120, they say: "We have already "referred to the argument that China might, in the "altered circumstances anticipated, produce for her "own consumption commodities which she now im-"imports, from India. It is alleged that not only "would she do this, but that she would also increase "her production of cotton and other articles, for "which her soil and climate are said to be suitable, "and send them into the market to compete with "Indian products. To this it is replied, and we "think with force, that the want of railways and other "means of communications in China, the heavy and "arbitrary imposts to which production is there "subjected, and other causes, deprive the apprehen-"sions of any very serious foundation." We now see what transformation is going on in China, and the same arguments that were used in 1893 cannot be used in 1898. The future competition of China is a serious matter, and more so to the mill industry of Bombay than to any other Indian trade with that country.

9737. Have you any other observations to make?—Nothing further. But I should urge again that, as I have recommended here, an effective gold currency should be established.

9738. Do you say a gold standard or a gold currency?—A gold currency with Imperial guarantee and assistance. I do not see that there could be much difficulty in putting that scheme into operation. The Government of India, in their proposal of the 3rd March 1897, say: "We have been led by public dis-"cussions in England to believe that Her Majesty's "Government might be willing to entertain the pro-"posal to give assistance to India in some shape "towards the attainment of the object we have in "view. While we cannot plead inability on our "own part to carry our proposals into effect, at any "rate so far as the stage to which at present we pro-"pose to confine them, we think it our duty to "represent that the establishment of a gold standard "in India is a matter of Imperial concern, and that "India may fairly claim that the whole burden should "not be put upon her. We would urge that Her "Majesty's Government should contribute not only "in material assistance, but by creating that greater "confidence which will undoubtedly be the result "of their publicly assuming a share of the liability." The Government of India are ready to go in for a gold standard if they are assisted by the Imperial Government, and, if this Committee will support this view, it is the easiest way of obtaining the establishment of a gold currency on a sound basis. You would thus get the means to obtain the gold, and all troubles would be ended. Of course these things will take time. You cannot borrow the money required to establish a gold standard at once, these things require time; in the meantime I would give it as my personal opinion that the present policy should be continued with a ratio of $1s.\ 2d.$ By the time that you make a gold standard possible, you might reduce the ratio to $1s.\ 2d.$, and see the effect of it—whether you get gold in the country by the time the standard is established. Failing a gold standard, the Association's view is in favour of continuing the present policy, with the proviso that Government should lend, if necessary.

Mr. Merwanjee Rustomjee.

16 Nov. 1898.

9739. (*Sir C. Crosthwaite.*) You described the stringency in Bombay during last year?—Yes, up to March 1898.

9740. You are aware that in that year the Secretary of State in Council sold a very few bills only?—Yes.

9741. That probably had some effect on the stringency, had it not?—Yes.

9742. Now he has resumed selling, has he not?—Yes.

9743. Still the Exchange has kept up at 1*s.* 4*d.* or thereabouts?—Yes. As to the reason of the Exchange being higher, I will read a paragraph from a letter addressed to me by Mr. Broacha, the chairman of the Brokers' Association. He says, "One of "our points is that artificial scarcity has but a very "temporary effect on Exchange, unless accompanied "by great preponderance of exports over imports. "Our point has received strong confirmation re- "cently. Although money now is very cheap, and "goes begging at 2½ per cent., Exchange remains "strong in the neighbourhood at 1*s.* 4*d.* This is "owing to the greater preponderance of exports over "imports this year over last year. This year, from "April to the end of July, the export has been "38 crores and imports 20 crores; or the excess "of exports over imports of merchandise is 18 "crores. Last year, from April to the end of July, "the export was only 28 crores, and import same as "this year, namely, 20 crores; or this year there is "an excess of 18 crores during the first four months "of the official year, whereas last year there was "an excess of only 8 crores."

9744. This year the Secretary of State is selling bills freely, and therefore, though Exchange is at 1*s.* 4*d.* or thereabouts, the discount rate in Bombay is only 4 per cent.; that is not a high rate, is it?—No, but last year, at the beginning of December, the rate was 5 per cent., and it went up to 9 per cent. at the end of December. At present the season is not in full swing, so you cannot judge anything from the present state of the money market.

9745. Still, you admit that not selling the bills had a considerable effect on the stringency?—Oh, yes, there is no doubt of that. Of course, it will not be so tight as last season in that way.

9746. Why do you advocate the 1*s.* 2*d.* as against the 1*s.* 4*d.* rate?—I advocate it on the principle that you are going for a gold standard, and I would impress upon you that it is advisable from many points of view. In the first place, take the mill industry, that is an important matter, and take the other trades in which India competes with China.

9747. Your principal reason is that you think that a 1*s.* 2*d.* rate will be better for Indian trade?—I am taking the Indian mills, and trade carried on in competition with China.

9748. Do you think that the 1*s.* 2*d.* rate will materially lessen the competition with China, if China really begins to make railways, and so on?—What I say is, we shall be able to lay down our yarn cheaper than we can now.

9749. Permanently, or for a time only?—In comparison to the 1*s.* 4*d.*, rupee we shall lay down always cheaper. If you fix the ratio at 1*s.* 4*d.*, and you alter it to 1*s.* 2*d.*, you can always lay down the yarn cheaper in China, and that is an advantage.

9750. But do you think it would give us a permanent advantage, or that that advantage would be gradually lost as prices in India rose?—The effect of reducing the ratio from 1*s.* 4*d.* to 1*s.* 2*d.* will be to increase the rate of China Exchange, and to that extent the mills will be always benefited.

9751. You think there will be no great difficulty in establishing a gold currency and a standard?—No, if you get the Imperial guarantee. I think it would go off easily.

9752. We have been told by some witnesses that, if anything of the sort is attempted, large hoards of silver will be brought out, which will sweep up all the gold either in hoards or in ornaments. Do you believe in that?—What I say is that the hoards are mostly with the princes. The hoards that are likely to come out are mostly with the princes and the large bankers. As far as we know, the princes will not do anything against the interest of Government; I am not much afraid of hoards coming out from them, because they can be always watched by the Government. Whether there may be hoards coming out, it is difficult to say; but, if you have the guarantee of the Imperial Government at the back of the Government of India, you will be able to meet all that.

9753. I suppose, if you went to 1*s.* 2*d.*, you would have to raise more taxation?—It ought not to be met by increased taxation, because the Government, when Exchange was at 1*s.* 1*d.*, have been able to pay their way. I do not see why, if you reduce the rate to 1*s.* 2*d.*, that should necessitate fresh taxation. During 1894–95 and 1895–96, Government were able to pay their way at a lower exchange; they need not go in for fresh taxation; they ought to accommodate themselves to the revenue.

9754. Do you know how much was borrowed by Government in sterling in the last two years?—I suppose the whole borrowing since the mints have been closed is about 17 millions.

9755. Is it paying your way if you borrow to that extent?—But the question is whether that was necessary. The Government stopped Council bills in 1893–94, and they went to the London market and borrowed. There was no necessity for borrowing that money. They have been borrowing for famine purposes and for war expenditure, but these are necessities that compel them to borrow. I think, the sooner the gold borrowing is put a stop to, the better. I wish to bring forward one point: that, as long as the present policy is continued, it may be difficult for the Government or for the municipalities or other bodies to borrow money in India.

9756. You mean by "the present policy," closing the mints and doing nothing?—Exactly.

9757. (*Mr. Campbell.*) You spoke of the monetary stringency that prevailed in Bombay last season. Do you expect a recurrence of that stringency during the next season?—No, not to that extent.

9758. Do you expect it to any extent at all?—Yes.

9759. Can you give us any instance of the higher rates of interest that you say were charged on such securities as Government paper and gold?—As a proof of the high rate of interest prevailing, I would say that the Secretary of State sold between the 9th February and the 28th March demand bills for Rx. 1,850,000, and T.T.'s for Rx. 2,310,000, at a difference of one-eighth in his favour, which gives 18 per cent. per annum interest, and the banks had to pay that 18 per cent. per annum as interest to the Secretary of State to lay down money in India.

9760. I was speaking more of the rates charged by the banks?—Further, I asked Mr. Broacha to let me know what was the current rate of interest within those months. He says that the interest on loans on gold was 15 per cent., and selling ready silver and buying for a month was done at as high as 24 per cent. per annum.

9761. That is not quite the same as a loan, is it? That means that a man makes a bargain and gets the bargain extended at that rate?—No. Fresh bargains are entered into. If you have 10,000 rupees in your hand, you can go into the silver market and invest them in silver at the moment, and sell it for a month, and get the 24 per cent. interest. It is not carrying forward anything. You can buy the ready silver and get the 24 per cent.

9762. Still it is more or less of a speculation?—It is not a speculation at all. If you have the money, you can go into the bazaar and sell for the month, and that brings you the 24 per cent. interest.

9763. You say, the rate for loans on gold and securities, such as Government paper, was 15 per cent.?—On gold it was 15 per cent. On Government paper it was very difficult to get money at any price.

9764. You refer to the difference between the Government demand bills and the Government telegraphic transfers as $\frac{1}{8}$th. My information is different to that?—I have given you my information.

9765. Might not that refer to special sales?—These are sales on one day—on Wednesdays.

9766. Is it not the case that, if the Government were selling at a rate for demand, they would always give you the option of taking telegraphic transfers at $\frac{3}{32}$nds higher?—The Government might be quite willing to give you the option, but the banks, seeing that there would be great competition at $\frac{3}{32}$nds, might tender at $\frac{1}{8}$th, and, as a fact, they did tender at $\frac{1}{8}$th.

9767. The difference of $\frac{3}{32}$nds represents an interest of 12 per cent. about?—But the actual sales are at 18 per cent. I can give you the figures. On the same day that the Secretary of State has sold T.T.'s he has sold demand bills at $\frac{1}{8}$th lower. Whether he was prepared to sell at $\frac{3}{32}$nds is another matter, but he has not done so. I suppose the banks being more anxious, and seeing that they must secure the money, offered $\frac{1}{8}$th. The fact is, at any rate, that the Secretary of State got $\frac{1}{8}$th, and the banks had to pay 18 per cent. during that period.

9768. You allude to the mill industry in Bombay. What is the amount of capital invested in that industry?—The amount of capital invested in that industry in Bombay is Rx. 9,000,000.

9769. They work largely, do they not, on borrowed money?—They work on borrowed money.

9770. They require to raise money to lay in stocks of cotton?—Yes.

9771. Do they fix these loans for any period?—For one year as a rule.

9772. What rate do they pay for the year?—Just now we have arranged a big loan at 9 per cent., and another at 10 per cent.

9773. That is, although the bank rate is 4 per cent., they are paying 9 per cent. for a years' loan?—Yes.

9774. On what security?—The agents give their own guarantee in addition to that of the mill itself.

9775. You alluded to the Government loans and Municipal loans. There was a $3\frac{1}{2}$ per cent. loan raised about three months ago of 120 lakhs?—Yes.

9776. Can you tell me what rate they got for that?—The last loan was raised at an average of 94 rupees, 12 annas, 5 pies, the amount was Rx. 1,200,000, and the total tenders were Rx. 1,700,000, and the interest was $3\frac{1}{2}$ per cent.

9777. They originally budgeted, did they not, for 3 crores?—Yes.

9778. Do you think, if they had offered 3 crores at the time, it would have been subscribed?—I doubt it.

9779. If it had been subscribed, would it have been at a lower rate, in your opinion?—Yes.

9780. How does that compare with the previous loans?—In 1896 they floated a 3 per cent. loan for Rx. $3\frac{1}{2}$ millions; the total tenders were Rx. 12 millions; the minimum rate accepted was $102\frac{7}{16}$; the average rate was 103; so that the tenders in that year were Rx. 12 millions against Rx. 1,700,000 this year. It shows that the contraction of the currency is telling upon the securities of India.

9781. (*Sir A. Dent.*) In the meantime there had been the plague?—The plague has nothing to do with this, because the loan is an international thing. London may tender to any amount, if they have confidence, but no sooner does Exchange go to 1*s.* 4*d.* than London is inclined to sell.

9782. (*Mr. Campbell.*) What is the present price of that loan?—$93\frac{9}{16}$.

9783. As against 94 rupees 12 annas, at which it was taken up?—Yes.

9784. Money, you say, is now at 4 per cent. in Bombay?—Yes.

9785. How do you account for the fall in price?—Because everybody is afraid that money will be dearer again later on.

9786. The subscriptions to these loans are paid into the Presidency Banks?—Yes, into the Bank of Bombay for Bombay subscriptions.

9787. How do the Government deal with these subscriptions when they are paid in?—They withdraw them from the Presidency banks, and put them into the general treasury.

9788. That is to say, they remove the money from the open market and lock it up?—Yes.

9789. Do you consider action of that kind opposed to the interest of those who have taken up the loan?—Yes.

9790. Does it tend to lend the money market against the holders of these loans?—Yes.

9791. And lower their market value?—Yes, and suppose a banker in India had tendered for a large amount, and wanted to pay for it and sell it in London, he has no time to do so.

9792. You alluded to the failure of the Bombay Municipal and Port Trust Loan. Is it the fact that the municipal loan was wanted for sanitary public works?—Yes.

9793. Would the failure to place that loan be very prejudicial to the interests of the community of Bombay?—Yes, at the present time it is very prejudical.

9794. It is not issued yet?—It was issued, but it failed; they could not get the money.

9795. Now we have heard a good deal about illicit coinage—the coinage of illicit rupees of full silver value. Have you any information with regard to that?—When I was in Bombay there was nothing much said about illicit coinage, but, after I left, there have been some cases in the police court of illicit coinage. I have nothing important to say on that subject beyond what is before the Committee already.

9796. You have no evidence of any large illicit coinage going on?—No, I have no evidence.

9797. (*Sir A. Dent.*) Have you any reason to believe that illicit coinage is going on?—Well, I was rather surprised when I was in Bombay that there was not much of that illicit coinage.

9798. (*Mr. Campbell.*) Is there not a large demand for silver ornaments all over India?—Yes there is.

9799. You may have seen the estimate made by the Government some time ago that about $3\frac{1}{2}$ crores of rupees were annually melted for conversion into ornaments?—Yes.

9800. That is when the mints were open?—Yes.

9801. Now it is cheaper to make these ornaments from bar silver?—Quite so, nobody can melt rupees now.

9802. And the cost of these silver ornaments is very much reduced by the lower value of silver?—Yes, those who are buying now, of course, are getting the silver at a cheaper rate.

9803. Would you consider that this great cheapening in price may have led to a more extensive use of silver for ornaments?—Oh, yes, for many reasons. There is a cheapening of price, and they might be thinking that the mints would be re-opened, and so they might hoard them. Also there is a great idea among the natives that the present is a good price to buy silver at, and I think that creates a demand.

9804. Then we have heard of hoarded rupees: would the effect of about 50 per cent. more weight of bar silver being obtainable as compared with rupees be an inducement to the holders, of those hoards to exchange their rupees for bars?—It would.

9805. They would get 50 per cent more in weight?—Quite so.

9806. Then we may add to that the knowledge that, if ever the mints are opened again, these bars could be immediately converted back into coins, and what cost them 71 rupees would be turned into $106\frac{1}{2}$ rupees?—Yes.

9807. Have you any doubt that rupees have been largely exchanged for silver in this way since the closing of the mints?—They must have been.

9808. Then, from your knowledge as a broker, would you say that there is always a great deal of speculation in silver among the bullion dealers and others?—Yes.

Mr. Merwanjee Rustomjee.

16 Nov. 1898.

9809. And, if there were any idea among these classes of an even probable re-opening of the mints, would not that be a strong inducement to buy and hold silver for that eventuality?—Yes, but my latest information from India is that people are buying silver for ornaments and art work. There is not much speculation going on in silver just now.

9810. But still, would not the profit between 71 rupees and 106½ rupees be a considerable inducement? —Yes.

9811. Taking all these circumstances into account, do you think it necessary to assume a great increase of illicit coinage to account for the large imports of silver into India?—I would not put it down to illicit coinage; at least I have no information on the subject whatever. We were all surprised that there was not illicit coinage, to a large extent, for so many years. It is only lately that we have heard so much about it.

9812. If the people of India were to become fully convinced that the mints would not be reopened, would not this inducement to speculate in silver be removed? —No, I think they will go on speculating because silver is cheap.

9813. But, if it were firmly believed that the mints would not be reopened, would you expect to see a diminution of the present imports?—There might be to a certain extent.

9814. Do you mind giving us your view as to native opinion in India upon the subject of the re-opening of the mints?—Bombay is largely interested in mill industries, and it does a very good trade with China in opium also. The opinion in Bombay in general is in favour of re-opening the mints to silver. If I may judge from that, I should say the feeling of the country would be favourable to reopening the mints.

9815. But your knowledge does not extend beyond Bombay?—No, but, if I may take the commercial people of Bombay, who are the leading community in India, and judge from their feeling, they would be pleased to have the mints reopened to silver.

9816. (*Sir A. Dent.*) You yourself disagree with that view?—My idea is that, if you can establish a gold currency with a guarantee, it would be better to do so; if not, I should go for the opening of the mints.

9817. (*Mr. Campbell.*) Would you suggest a correct means of ascertaining the feeling of the natives of India? —The best plan, I think, would be to address the Chambers of Commerce in India, and request them to get native opinion on the subject. They could easily find it out, because they are in touch with native traders, people connected with commerce and mills, and the shroffs; and, if the Committee ask them, they could get native opinion; they would be able to find it out.

9818. (*Sir A. Dent.*) Do you think it would not be coloured by their own opinion?—No. I think all the Chambers of Commerce can be safely trusted; they are all honourable bodies, and they would submit to you whatever is the correct opinion of the country on the subject.

9819. (*Mr. Le Marchant.*) You were making some reference just now to a statement as to forged rupees? —Yes.

9820. Perhaps you were alluding to the forging of Farrukhabad rupees?—Yes.

9821. They were not used for currency purposes? —No.

9822. They were used for ornaments?—Yes.

9823. With regard to the difference between the rates for telegraphic transfers and for Council Bills, which you describe as having been equivalent to interest at 18 per cent. per annum, were not the higher rates given for transfers on the occasion of special sales, which were subsequent to the weekly allotments, and formed separate transactions?—If you will permit me, I will read you a few of these sales; and you will be satisfied about it. We know that the extra bills sold on off days are for small amounts.

9824. (*Mr. Campbell.*) Sometimes?—Sometimes they are. On the 9th March 20 lakhs of Council bills were sold at 1*s.* $3\frac{29}{32}d.$; on the same day 20 lakhs of transfers were sold at 1*s.* $4\frac{1}{32}d.$ Then on the 2nd March 20 lakhs of bills were sold at 1*s.* $3\frac{29}{32}d.$ and 20 lakhs of transfers were sold at 1*s.* $4\frac{1}{32}d.$ On the 23rd March 17 lakhs of bills were sold at 1*s.* $3\frac{31}{32}d.$, and 32 lakhs of T.T.'s were sold at 1*s.* $3\frac{25}{32}d.$ Looking at a table that I have prepared from a reliable source, I find that from the 9th February to the 28th March the difference paid by the banks against T.T.'s was one eighth of a penny.

9825. But Government were always willing to sell at $\frac{3}{32}$ above the demand rate?—They may be willing, but, seeing the value of money, the banks may have offered more.

9826. Still that does not do away with the fact that the Government were always willing to sell at $\frac{3}{32}$ above the demand rate?—What I say can be easily confirmed. I have taken the statement from a bank's books, and for my own satisfaction, to prove that 18 per cent. was the rate that the banks paid to the Secretary of State. They preferred to take T.T.s to taking the demand bills at $\frac{1}{8}$ less, because they wanted to pay their way. They may have thought that forward demand bills were no use.

9827. They were willing to pay $\frac{1}{32}$ more than they need have done?—Well, in those times one must be sure of getting the money anyhow.

9828. They may have made a bad shot?—If they did not make a bad shot, they might have had to pay $\frac{1}{32}$ more.

9829. (*Mr. Le Marchant.*) What effect do you think has been caused by the fixed gold point of 1*s.* 4*d.*? You may have noticed what has been said as to the "evasion of the maximum"?—Yes.

9830. Do you consider that the effect of fixing a certain rate is to prevent exchange from rising to that limit? If no limit had been fixed, might not transfers have risen still higher?—Yes, and it would have been bad for mills and trades competing with China. If this maximum was not fixed, things would have been much worse for them. As it is, I am not sorry that that maximum is fixed, because it keeps exchange from flying up all of a sudden and then coming down; so that I think that maximum is a check; and, as to those industries that have been suffering to some extent from the closing of the mints, it has been some amelioration to them.

9831. But, in endeavouring to state the effect on the exchange itself, account may be taken of the effect of the maximum that you have just mentioned; that is to say, it has had some effect in preventing exchange falling?—Certainly.

9832. With regard to the system of borrowing on Government paper, is it the custom of many traders in India to keep their capital in Government paper, and to borrow on that when they require funds?—Yes, the rich merchants do that.

9833. In that way they get the interest on the Government paper?—Yes.

9834. And they prefer this course to having a deposit at a bank?—A deposit at a bank is no use. If I am a merchant, and I have my money deposited in a bank, I cannot use it for trade purposes.

9835. Because of the fixed term?—Yes.

9836. And if you do not deposit for a fixed term? —Then you do not get a good rate of interest.

9837. Does that system of keeping capital in the form of Government paper increase the stringency when money is dear? For instance, there would possibly be a demand for advances from many borrowers at the same time?—It is good for the Government of India. Why should the merchants not keep Government paper? I do not see. Because it is the safest security, and it is best for the Government of India that the merchants should keep the Government paper. These very big merchants cannot keep their money in any other form but Government paper, so as to raise money on it whenever they like.

9838. Would not that cause a greater stringency of money?—I do not think so. The fact of people

holding Government paper in India has nothing to do with the stringency of money.

9839. But when they want money in an emergency they are compelled to borrow?—They are compelled to borrow. There must be facility for them to get the money. It is a good thing that people keep the Government paper, I think, because it is for their safety. I do not think it is a bad thing.

9840. It has a tendency to increase the number of borrowers when money is required?—Certainly. If many people have Government paper, it increases the demand for money, no doubt.

9841. And there were circumstances at the time of pressure, I think you have already mentioned, which caused the supply of money to be short. The banks had not been provided with resources by Council bills and other means?—They did their best to supply themselves with means, but there were not the channels to get the money for trade purposes, and it was a question of whether it would pay to get Council bills.

9842. Or to import gold?—Yes.

9843. It is a question of price—of cost?—It is a question of cost certainly, they would hesitate to bring it up to gold point.

9844. Many people may have anticipated that exchange would fall again rapidly. Exchange had risen from 1*s.* 3*d.* to about 1*s.* 4*d.*, and it was natural to anticipate a fall when the pressure was over?—Yes.

9845. That would be a reason for London houses objecting to buy exchange at that price, and for their not sending sterling out at what might be the top of the market?—Quite so.

9846. And equally a reason for borrowing in India for a short period, expecting exchange to become more favourable after the crop season. Traders would prefer to supply their immediate requirements for money by short loans in India?—Quite so.

9847. Rather than to convert sterling into rupees at 1*s.* 4*d.*?—If anybody wanted to convert sterling into rupees, it would be a disadvantage.

9848. To part with gold for rupees would have meant getting only 15 rupees for the sovereign?—They would not do it.

9849. And the same motive would make them hesitate to buy exchange on India from this side?—Yes.

9850. So that at the time the chief strain was thrown on borrowing?—Quite so.

9851. Do you think also that the difference between the rate of 1*s.* 3*d.*, at which exchange had been about the turn of the year ——?—It was in last December 1*s.* $3\frac{1}{32}$*d.*, then it suddenly went up.

9852. May the sudden rise of about 1*d.* have operated to cause a subsequent fall—a reaction—to be anticipated?—Yes.

9853. So that there would be more objection to deposit gold after such a sudden rise than there would be if exchange had been ruling at 1*s.* 4*d.* for a considerable period?—If I may speak from the experience of last season, when exchange was at gold point, that is over 1*s.* $4\frac{1}{16}$*d.*, everybody thought it was the time to buy gold and keep it—not to give it to the Government.

9854. And that was to some extent owing to the fact that the rise had been sudden?—No, it had reached a point from which there could be no further rise in exchange, and that was the principal reason why people at that point would rather buy gold than sell gold.

9855. Does that feeling still continue to the same extent?—Well, I have left India for the last six months, and I do not wish to say definitely what it is at this moment, but I think the same feeling would continue, should circumstances be the same.

9856. Would it partly depend upon the prospects of future exchange? Suppose it were thought that exchange would remain at about gold point, there would be less reason for converting rupees into gold?—Well, how could you create that sort of feeling, I want to know. You cannot create the feeling that it will remain at 1*s.* 4*d.* or 1*s.* $4\frac{1}{8}$*d.* for a long time. People must have reasons to judge, and then they would not convert the rupees. As long as they are not satisfied on that point, they would go on converting the rupee into gold, but there must be some facts to go upon.

9857. What kind of facts do you think there could be?—Supposing we have 1*s.* $4\frac{1}{8}$*d.* exchange now, why should it not go down to 1*s.* $3\frac{1}{2}$*d.* after two or three months? Can anyone give any reason for it?

9858. If, on the other hand, it were lower, would not the same argument still apply, that it might fall?—It would depend on the circumstances of trade and the money market at the time.

9859. What is the estimate of the trade position now?—Just now, of course, there are big crops, and they expect a large export season, and I suppose people are sending money there while the rate is under 1*s.* 4*d.*; but, if it goes over 1*s.* 4*d.*, I think people would not send money; they would think that they ought to wait—I mean until the necessity arises. As we have seen, last season a man would rather pay a higher rate of interest, and amongst bullion dealers they carry a large amount of gold at a big rate of interest rather than sell it. There is a point when there is a temptation to buy sterling—when it goes over 1*s.* 4*d.*

9860. As an exchange operation, or as an operation in gold?—For both.

9861. Do you think any circumstances would counteract that? Perhaps you consider that the particular mode you mention of introducing a gold standard would be an effective way of dealing with it?—To stop them from buying?

9862. No; to create confidence in the maintenance of the rate?—Comparatively there would be much greater confidence.

9863. You mentioned that the price of Government paper in India was higher some time ago than recently?—If you wish to have some of the figures, as this is an important matter, I will give them to you. The quotation in May 1896 for $3\frac{1}{2}$ per cent. paper was 110·4; the quotation in May 1897 was $103\frac{9}{16}$; the quotation in May 1898 was $94\frac{1}{2}$.

9864. Would you ascribe the difference directly to the limitation of the currency?—What I say is that, if there were no new loans, the rate would not be so low as that, comparatively; but the present rates represent the closure of the mints together with the new loans floated. If there were no new loans floated, the price would rise again. Of course, in the present state of the market in India it would rise. If this season Government had not floated the new loan, we should have seen much better rates for Government paper than we see now.

9865. So that it is the supply of additional loans, together with the effects of the closing of the mints?—The supply of additional loans and the closing of the mints, taken together, make the present rate of the market.

9866. In the ordinary conduct of busines in Bombay, do you make payments by cheque or by currency notes? What is the usual system of payment?—Among the English mercantile community the rule is cheques; among the Native mercantile community it is more in notes.

9867. Are notes coming into more general use in Bombay?—I think so. There is as much confidence in the currency notes as in actual coin.

9868. Do you consider it desirable that notes should be issued by the Government, as commanding more confidence than if issued by any other body?—The present system has the entire confidence of the public.

The witness withdrew.

Adjourned.

TWENTY-SECOND DAY.

Tuesday, 29th November 1898.

PRESENT:

The Right Hon. SIR HENRY H. FOWLER, G.C.S.I., M.P. (in the Chair).

SIR FRANCIS MOWATT, K.C.B.
SIR DAVID BARBOUR, K.C.S.I.
SIR CHARLES CROSTHWAITE, K.C.S.I.
SIR ALFRED DENT, K.C.M.G.
MR. ROBERT CAMPBELL.
MR. EVERARD HAMBRO.
MR. W. H. HOLLAND.
MR. F. C. LE MARCHANT.

MR. ROBERT CHALMERS, *Secretary.*

Mr. J. Galloway.

29 Nov. 1898.

MR. JOHN GALLOWAY called and examined.

9869. (*Chairman.*) You reside at Glasgow, and you are President of the Glasgow Chamber of Commerce and Manufactures?—I am; but I wish it to be distinctly understood that I do not appear here in my official capacity.

9870. The evidence you are going to give us to-day is evidence in your private capacity for which you alone are responsible?—Exactly.

9871. You can, however, tell us whether the question of the Indian Currency has been considered at all by the Glasgow Chamber of Commerce?—It has been very fully considered. I should say it has been more fully considered than any question which has come before the Chamber for the last 15 or 20 years at any rate. It came up before a committee of the directors first of all, and a long discussion took place upon it. There were two motions proposed: one in favour of the re-opening of the mints, and the other in favour of a gold standard. A number of the directors who were present did not see their way to vote at all, but, of those who did vote, six voted for the establishment of a gold standard, and four voted for the re-opening of the mints.

9872. The directors, I suppose, are a committee of their whole body?—The managing committee of the whole body.

9873. May I ask how many members there are of the body of directors?—There are 36. Then, after that, it came up before a general meeting of the Chamber and was discussed there, and it was remitted back to the directors to be considered. In consequence of that remit, it came up before the directors, and they discussed it for a considerable time and appointed a committee in order to consider it and bring up a report. That committee met and considered it carefully, and they found that the opinions were so divergent that they could not come to any conclusion, and they remitted it *simpliciter* back to the directors again. It came before the directors after that, and they again discussed it carefully, and they found they could not come to any decision, and they remitted it back to the whole body of the Chamber to be considered by them; they remitted it back *simpliciter*. The Chamber met and it was considered there again. There were three motions proposed: one for the re-opening of the mints; another in favour of the gold standard; and the other motion was that, owing to the fact that this Committee had not yet fully examined into the question, the Chamber should not come to a decision until the full evidence was taken. The movers of the two first motions withdrew, and the last motion became the finding of the Chamber. That is the position in which the matter stands at the present moment.

9874. When did all these discussions commence?—Three or four months since.

9875. After this Committee was appointed?—Yes.

9876. All this that you have been telling us took place after the appointment of this Committee?—Yes.

9877. I suppose the views you are going to express, although they do not represent the views of the Chamber of Commerce, yet do represent the views of a considerable number of your members?—It is very difficult to give anything like the proportion, but I should say that I represent the views of, at least, half of the Chamber.

9878. Now, have you in your business any direct connection with India?—I have a direct connection with Burma.

9879. Will you tell us in what capacity?—Until about five years ago, when I retired from business, I was senior partner in the business of P. Henderson and Company in Glasgow. That firm for upwards of 45 years has conducted the trade between Glasgow and Rangoon, first by sailing vessel and then by steamer. They also initiated the Irrawady Flotilla Company in 1865. The Irrawady Flotilla Company navigates the River Irrawady and its Delta. In connection with this business, and in connection with our representatives in Burma, I know the trend of trade, both between Scotland and Rangoon, and also the inland trade of the country.

9880. As the result of your experience, what is your opinion of the policy of the Government of 1893 in closing the mints?—I strongly approve of it.

9881. Would you give us your reasons for that?—I approve of it because of the great amount of friction and annoyance and loss that resulted to large numbers of trades in connection with Burma through the fluctuation in the rupee. The fluctuation in the rupee was such as to turn trade into a perfect gamble, and the consequence was that those who were engaged in that trade never knew what was before them; they did not know when they entered into a particular contract but that, before the contract was completed, the rupee would have fallen and would have involved them in a loss. In addition to that, the strain has been very great; so great that, as you are aware, the Bengal Chamber of Commerce petitioned the Indian Government to intervene.

9882. Apart from any question of the ratio as between gold and the rupee, what I understand you to say is that the inconvenience arose from the absolutely unstable exchange?—Exactly; and I have spoken to a very large number of exporters, manufacturers, and dyers connected with the West of Scotland, and I may say they are unanimous, with one or two exceptions, in condemning the policy of re-opening the mints, as bringing back a state of things that they felt was extremely hurtful to their interests.

9883. I suppose that a good part of the trade of Burma is with gold-using countries?—I understand that in that respect it is something like India, nearly the whole of the trade is with Great Britain.

9884. I think we have it in evidence before us that above 80 per cent. of the trade of India is with Great Britain and with other countries having a gold standard?—I would say that the trade of Burma is in a greater proportion with gold-using countries.

9885. Do you think that the falling rupee has stimulated the exports from India?—Well, I would say yes, and I would say no. I have no doubt whatever that the falling rupee has had a good effect at first upon a number of exports. It is quite possible, I do not know all the trades of India, but it is quite possible that some of them have been permanently benefited, and there are others where the adjustment of prices and other things coming in have taken away the extra profits, and there are other exports which have received permanent damage. If you take the jute trade of Dundee: suppose when the rupee was at 2*s.*, I had gone to a Dundee manufacturer with a ton of jute and six sovereigns. He would have given me for that, a ton of manufactured goods, and he would have spent the six sovereigns in the manufacture—in wages. Suppose I had gone to a manufacturer in Calcutta, and suppose that at that time he could have done the same thing: if I had gone when the rupee had fallen to say 1*s.* to the Dundee manufacturer, he would still have done the same thing with the six sovereigns; but, if I had gone, when the rupee was at 1*s.*, to the Calcutta manufacturer, he could have done the thing cheaper, because in the meantime the rupee had fallen, and his wages instead of being 6*l.* would only have been 3*l.* In that way the Dundee manufacturer is handicapped, and all foreign manufacturers are handicapped; and in this matter, as you are damaging the interest of those who take the jute, naturally you damage the export trade in jute, and, if it goes on to a certain length, you will strangle the trade altogether, and in that way do permanent damage to the export of jute.

9886. What you mean when you talk about the wages, I suppose, is this, that the Calcutta manufacturer would be able to buy for three sovereigns the number of rupees which, supposing the rupee had remained at 2*s.*, he would have had to give six sovereigns for?—That is so.

9887. He would not have raised the wages?—He would not have raised the wages. Then, again, take the tea trade; that is another illustration of the same thing. I have no doubt whatever that, when the rupee began to fall and continued falling, the tea-growers got large profits, but these large profits stimulated the planting of tea gardens, and the consequence is at the present moment there is an over-supply of tea, and the market is glutted. Now, it matters not although the rupee were to fall further, so long as there is a glutted market, you cannot increase the exports from India. These are two illustrations of the way in which this law acts—that is, that, when the rupee falls, it does not necessarily benefit all the export trade of India.

9888. Now, how has it affected the imports?—The whole of the imports have undoubtedly been injured in the first place, because, until the prices were adjusted, the people had sent them out on the old basis; in the meantime the rupee had fallen, and the consequence is that they came in for loss. I have spoken to a large number of exporters in Glasgow, and they spoke with very great bitterness on that subject, and stated that in their experience it was not only the irritation and the annoyance and the consequent strain that was put upon them in arranging their business transactions, but also that serious loss accrued from it.

9889. Are there any other trades you would like to mention that have been injuriously affected by the falling rupee?—There are some other trades. Wherever there is a business in India financed from England, the return from which is in rupees, and the part which represents the profit, the working expenses on this side, and depreciation, has to be remitted to this country, then there is a decided loss accruing to these trades. It is quite apparent. When the rupee was at 2*s.*, one thousand rupees gave 100*l.*, but when the rupee had fallen to 1*s.*, if it did fall to that, one thousand rupees only gave 50*l.*, and the consequence is that a great deal of loss has accrued. These interests are made up of oil wells, the coasting trade, railways, and river navigation, and there may be others.

9890. Has there been any recouping of this loss by advancing prices?—There is in a number of trades, but not in all. There has been a recouping in prices, but that recouping results in an injury to India, because it is actually throwing a tax on the whole population of India; that is, that in India, when the manufacturer who sends out goods from this country increases the price of his goods in order to recoup himself for the decreased payment in rupees, the native who gets no more, or a very little more, for his wages, is obliged to pay a higher price for his European goods.

9891. He is obliged to pay more rupees?—More rupees.

9892. And he does not earn any more rupees; his power of earning the rupees remains the same and he has to pay more rupees for what he buys?—Exactly, and that, as is well known, acts as a restriction on trade.

9893. Then, taking your statement just now that 80 per cent. of the trade is with gold-using countries, does that mean that the bargains are concluded, both imports and exports, entirely upon a gold basis?—The merchant who sends out from here makes all his transactions in gold, but, when he has to deal with the natives, they make their transactions in silver.

9894. But are their calculations based on the gold value of that silver?—Do you mean the calculation of the natives?

9895. Yes?—No, certainly not. They know the rupee and they know nothing more. For instance, if our steamer going up the Irrawady takes on board 100 passengers, those 100 passengers simply know the rupee, they know nothing of the gold standard or gold currency.

9896. There you are dealing with the internal trade. I want you to confine yourself for a moment to the foreign trade. Let me put these two cases. The Manchester man sells to India a bale of cotton goods. The Indian merchant sells to Manchester a quarter of wheat. Are both prices calculated in the first instance on their gold value in Manchester?—I am not in a position to answer that.

9897. You see what I mean?—I see what you mean, but I cannot answer that.

9898. I suppose there is a very considerable trade on the Irrawady from Rangoon to Bhamo?—Yes, it is a thousand miles from Rangoon to Bhamo, and then the Flotilla Company also navigates the Chindwin river, and the towns and villages on the Delta, including Bassein.

9899. Dealing with the internal trade, I understand you to say that practically the depreciation of the rupee has not had any effect on that trade. The rupee remains the same?—The rupee remains the same exactly. You mean the raising of the price to 1*s.* 4*d.* has had no effect?

9900. No, I was going back. What I call the starting point is not the raising of the rupee from 1*s.* to 1*s.* 4*d.*; I call the starting point the reduction to 1*s.* It is now a recovery, it is not a starting point?—Then, so far as that goes, our rates for carriage have remained very much the same; they are somewhat lower in consequence of the opposition of the railway, but, so far as we are concerned, they have not been raised at all.

9901. I suppose you practically could not raise them?—We practically could not raise them, for two reasons: one is, that, the moment we raise our rates, we should at once get the native boat-hirers and boat-owners on the Irrawady coming into competition. In addition to that, we are running alongside the railway, and we could not raise our rates in consequence.

Mr. J. Galloway.

29 Nov. 1898.

9902. Now we come to another question about the stringency of currency. Have you had any difficulty in carrying on your business in consequence of the stringency of currency alleged to have arisen from the closing of the mints?—None whatever.

9903. Was there a great demand at the commencement of the famine for rice?—There was. There was a stringency of money in the country for a short time when the demand for rice came, but I think that that stringency would have taken place, even although the mints had been open, because it was a thing quite independent of the opening of the mints. Afterwards, in consequence of the great demand made by India on Burma for rice, the whole of which had to be paid for in rupees, there was actually a redundancy of currency in Burma; and I would presume that that, together with the vast sums sent to the frontier for war and for famine relief purposes, would, in great measure at all events, account for the actual stringency which took place in commercial centres.

9904. Then you would attribute the stringency partly to the money sent to the frontier for war purposes, and partly to money sent for famine relief purposes, and partly to the large sums paid for rice?—I am not prepared to say that the whole stringency arose from that.

9905. But partly?—Partly, certainly.

9906. Has there been any difficulty in conducting the internal trade of Burma in consequence of the stringency of money?—That is a question that I have consulted our agents in Burma very particularly upon, and they answer emphatically that there has been none.

9907. What rate of interest has prevailed in Burma?—At the time that that stringency took place to which I refer, it ran up to 15 per cent.

9908. That was the highest rate?—I understand that that was the highest.

9909. Have you any opinion to give us as to whether any discontent exists among the natives of Burma on account of the closing of the mints?—There has not been the slightest discontent. The fact of the matter is that most of them do not know that the mints were closed, and, even if they were told, I do not think they would be in a position to argue the matter out. I am perfectly confident that there has not been the slightest discontent.

9910. Is there much hoarding of rupees?—The Burmese are quite different from the Indian people, they have different habits altogether. The Burman is a pleasure-loving man, and, whenever he gets a certain amount of money in his possession, he thinks his first duty is to go and spend it; he visits the pagodas, makes votive offerings in the pagodas and shrines; he spends money also in travelling. Of course they have a love for jewels and ornaments, and they spend a great deal of money in these, but hoarding in the sense in which it is understood in India does not take place. I should presume that in India itself, owing to the closing of the mints taking the Government as a competitor out of the road, the native would be able to purchase his ornaments cheaper than he would otherwise have done. So that, so far as that goes, I presume it would be a benefit to him.

9911. Are many of the ornaments in Burma in coins? Do they hang coins round their necks, and so on?—I think there are a few, but it is not so much that as in manufactured ornaments and in precious stones.

9912. If the fall of the rupee were arrested, and it were put on a permanent ratio, do you think that any loss which might arise would be temporary or permanent?—I think it would be temporary, that prices would adjust themselves; putting out of account the benefit that would arise to trade otherwise.

9913. We have had some evidence before us that the trade with China and Japan and the Straits might be affected by adopting a gold standard. Have you any opinion on that point?—I have no fear whatever of that. Statistics show, I think, that that is not the fact; but, over and above that, China has not a silver currency; the currency that it has is copper, if it is anything. Then in regard to Japan: Japan has gone on to a gold currency. As to the Straits, I am perfectly certain that, if India adopted a gold standard and a gold currency, the Straits would follow suit. I feel quite certain that that would be the result.

9914. That would settle, of course, the Straits question; but with reference to the commercial development of China, which is supposed to be in the near future, how do you think it will affect that? Take the case of the tea trade: the Indian tea-planters say that to raise the price of the rupee is to give a bounty to the Chinaman as against the Indian?—I have no fear in regard to the tea trade. Mr. Ralli, when he gave evidence here, mentioned, and I think he was quite correct, that the methods in China were 4,000 years old. In addition to that there is the very large export duty in China, and then there is a want of facilities for carriage, making the carriage to the ports very high. In addition to that there is the greater amount of freightage required from China to the European ports than from India to the same ports. I think that all those matters put together place India in a very safe position, in so far as competition from China is concerned.

9915. I suppose there is also the competition of quality?—There is also the competition of quality, and I understand both the Indian and Ceylon teas are very much better than the China tea.

9916. Your opinion is that the maintenance of the rupee at its present value will not prejudicially affect the trade with China and the Straits, but, if it could be proved that the raising of the rupee injured the trade with those countries, would that affect your opinion?—Certainly not, because the trade with gold-using countries is 80 per cent. of the trade of India. With China and other silver-using countries, it is only 20 per cent. In addition to that, in China and Japan and the Straits, they have a climate similar to the climate of India, raising the same kinds of exports, and therefore there is not the room for expansion in that trade that there is in European markets where the climate is different, and where the products are so different from those of India; and, as the trade with gold standard countries is an expanding trade, it would be folly, independent altogether of its greater amount, to seek to foster the trade with silver countries at the expense of the trade with gold countries.

9917. I gather from the evidence that you have given us that you are in favour of putting India on to a gold standard?—Certainly.

9918. Have you considered the question of the gold standard apart from gold currency, or have you considered it in connection with gold currency?—I have considered it in connection with gold currency.

9919. Do you think it is possible or wise or practicable to establish a gold standard without a gold currency?—I think it would be much better if a gold currency could be got; but that is a matter for currency experts, and I should not like to give my opinion upon it.

9920. Do you think that, if a gold standard were adopted, the habits of the people would remain the same as you have indicated they have remained during all this transition stage—that the rupee is the rupee in India and will be the current coin of India?—Certainly. I have a very strong opinion with regard to that. I suppose you are speaking with regard to some of the fears that have been expressed about a gold currency disappearing through the hoarding habits of the natives.

9921. Yes. Will you deal with that first of all?—With regard to that I have not the slightest fear. The natives have had this habit from time immemorial of hoarding silver coins; and the whole of us know that Eastern habits are habits that remain with the people from generation to generation, and that it is one of the most difficult things to change the habits of an Eastern's mind, or the habits of an Eastern's doings. Therefore, I am perfectly satisfied that the

hoarding of silver will continue. In connexion with that, I may say that I have been in Turkey. In Turkey, gold and silver circulate together; and the Turks are a hoarding people just like the Indians. In that country it is the silver that has continued all along to be hoarded. In the fields of Syria I have seen women with 20*l.*, 30*l.*, and even 40*l.* in silver coins upon their heads—a weight so heavy that they had pads to protect their heads—and it was only in one or two cases here and there that you saw a gold coin. I have travelled through Syria and Asia Minor, and I found the same thing. Of course at Jerusalem and Damascus, where there are so many travellers, you do find gold, and at the large seaports; but in the inland towns you never come across a gold coin: gold does not seem to have penetrated the country beyond the maritime ports, and I am perfectly satisfied that in India it would be the same thing. It would take years and years for the gold currency, if it were established, to go beyond the centres of trade—Calcutta, Bombay, Rangoon, Madras, Karachi—and the vast mass of the people would remain exactly where they are; and with regard to hoarding, even in those centres, I feel satisfied that the great bulk of the Indians would continue to hoard in silver and not in gold: first of all, because of habit, and in the second place because their earnings are small, and, therefore, their savings must of necessity be small; they could not pass a sovereign into hoard; it must be in the shape of a silver coin. Then, in addition to that, when they are wanting to spend their money, these small silver coins are much more handy than gold coins would be. For these three reasons I certainly think that the gold currency would not be absorbed, and would not disappear in the hoards of the natives.

9922. Would that lead you to the opinion that a moderate amount of gold currency would be sufficient?—Certainly; supposing I am right, that takes away one of the great evils that it was anticipated would flow from the establishment of the gold currency, and therefore would naturally make a very much smaller quantity of available currency sufficient for the purpose.

9923. Of course, if everyone who had 15 rupees came and demanded to have the 15 rupees turned into a sovereign, that would make a tremendous call on the Government?—But you can scarcely conceive that every one of the 300 millions of the natives of India is going to rush to the mints with all the silver he has, and get it exchanged for gold. All the more, that the gentlemen who are opposed to me in opinion tell us that the gold standard is a thing that the natives do not want; that the natives do not understand it; that they are not accustomed to it and will not use it, and that the thing will be a total failure in consequence. The two arguments are flatly opposed the one to the other.

9924. Then your opinion would be that the really effective gold currency would be for international transactions and not internal transactions?—That is my opinion. I think that very likely in the course of years the gold currency might penetrate into the country, but it would be gradual.

9925. Have you formed any opinion as to illicit coinage?—That is a matter on which I have had considerable doubts. It seems to me to be a very great temptation to a native to have the difference between the coin value of the rupee and the bullion value, and it would be a great temptation to the Indians to take to illicit coining; but that is a matter on which, I understand, the Government is making inquiries, and I would not like to give a definite opinion upon it.

9926. Reference has been made to the prosperity of other countries under a silver standard. Have you any experience of South America?—I have been in South America and I have travelled over a large part of Argentina. I have talked on this subject with the principal members of the English colony there, with merchants, bankers, and others, and my opinion with regard to it is that the ideas which have been put forward by those who favour a falling rupee are entirely wrong. In the first place, I never, during the whole time I was in Argentina, saw either a gold or silver or copper coin in circulation. Such do not exist. The whole currency is in paper, and the standard is not silver but gold. You could not get better proof of the danger of an unstable medium of exchange. When I first went to Argentina in 1887, the premium on the dollar was 14, that is, it took 114 paper dollars to purchase 100 gold dollars. Before five or six years had elapsed, the premium had risen to 360, that is, it took 460 paper dollars to purchase 100 gold dollars, and the consequence of this was the revolution in which President Selman was ejected from his office; then the Baring collapse came and hundreds of firms out there were ruined. You could not possibly get a better object lesson than Argentina as to the danger of having an unstable medium of exchange.

9927. Have they any gold coins out there at all?—No gold coins at all, neither gold, silver, nor copper. Everything is in paper. I never saw a coin of any kind while I was in Argentina; trade is conducted in paper currency.

9928. Does that apply to internal transactions?—Yes; when you went down to a railway station, for instance, to purchase a ticket you did not know what it would cost.

9929. They added the premium to it?—They added the premium, and you had to give so much more paper. It has been stated that Argentina is a prosperous country. Now the very opposite is the case, although I believe that it is the best of the South American Republics. Argentina has an area equal to the whole of Europe, excluding European Russia. It has some of the most fertile tracts in the world. It has only 3½ millions of people, and it is labouring under a debt which, to a country of such resources, ought to be nothing. Therefore I do not look upon it as a country which can be quoted as prosperous; and over and above that, from time to time there are revolutions there in which the merchants and dealers lose all that they have.

9930. That is politics and not currency?—But the currency leads to the politics. The currency led to the revolution which I have referred to, when President Selman was put out of office. That was undoubtedly in consequence of the premium on the gold.

9931. Have they not constructed in recent years one of the finest docks in the whole world at Buenos Ayres?—They have, but it is all with borrowed money.

9932. It is borrowed money in the sense that the Government have borrowed the money and have built the dock out of it; but does it not pay a very large percentage?—I am not aware that it does.

9933. Now what is your opinion with reference to the proposal to reopen the Indian mints?—I think the re-opening of the mints would be something very disastrous to the trade of India, and in a great measure to the trade of England also. The fall of the rupee from 1*s.* 4*d.* to 10*d.* or 9*d.* would be something too dreadful to contemplate.

9934. I suppose, if a catastrophe arose from such a cause, the effects of the catastrophe would be felt in Liverpool, Manchester, Glasgow, and London, almost as much as they would be in Bombay and Calcutta?—No doubt: the two countries are bound together in such a manner that a catastrophe to one must be felt by the other.

9935. It has been suggested to us that the mints might be gradually opened so as to prevent this catastrophe?—I have no faith in such a course: the moment such a policy is commenced, the whole thing would be discounted and the rupee would drop at once to the bullion value of silver. Whenever you began to bring it down gradually, supposing that were possible, everybody would know what it was tending to, and the whole thing would be discounted.

Mr. J. Galloway.

29 Nov. 1898.

9936. You do not think the bankers of London or India would be deceived by a gradual process of that kind?—Certainly not.

9937. What do you say about increasing the taxation of India?—In the first place, I do not approve of it as a free trader, because it is going into the old system of taxing trade. And, in addition to that, it is taxing the multitude for the sake of the few, and I am decidedly opposed to anything of that kind. I am quite certain, for instance, that the tax that is proposed to be put on, would ruin the Dundee mills.

9938. You mean the proposed tax on jute?—A tax on jute would ruin the Dundee mills, and a tax on jute is one of the things which has been pointed out as possible.

9939. You mean an export duty?—An export duty.

9940. Then, I understand, in addition to that, it has been proposed to put a tax on the export of tea?—It seems to me to be terribly absurd, when the tea trade is the principal trade for which all this agitation is going on, to think of putting a tax on tea. To quote a homely illustration, which is very apt, I think, it would be like a dog trying to live by eating his own tail.

9941. I suppose, if a tax were put on tea, it would be paid by the consumer?—It would be paid by the consumer in England, certainly.

9942. Therefore, the proposition is, that the consumers of tea in England are to pay a tax for the benefit of the tea-growers in India?—Exactly. And, in addition to that, there would be this offset, that it would bring the price of Indian tea nearer to the price of good China tea.

9943. As an experienced merchant, having seen a good deal of the public life of this country, do you think it a reasonable supposition that the Parliament of Great Britain would impose such a tax?—Certainly not; but still it has been put forward as a proposition.

9944. Now, as a manager of the Burmese Navigation Company to which you referred, have you had much contact with the exporters from this country to Burma?—I have, and lately I have purposely put myself into communication with them.

9945. I suppose I may say the export firms in Glasgow?—The export firms in Glasgow; and I may say the export from Glasgow to Burma is very large.

9946. Will you tell us what their views are?—You can divide the exporters into two sections. There are the exporters pure and simple, and there are the manufacturers and dyers who not only manufacture but who also export. As I have said, I have put myself into communication with these. I have seen 18 of the principal exporting firms in Glasgow. I may just mention that I did not go to James Finlay & Co. because I know that Sir John Muir sat upon this Committee; but I went to 18 other firms. Of those there were two that were uncertain; there was one that was opposed to the gold standard, and one that partly agreed and partly opposed. The rest of these firms, amounting to 14, gave me authority to state before this Committee, "That they found the "falling rupee extremely disadvantageous; that they "have been much benefited in trade since the rupee "became fixed at or about 1*s.* 4*d.*, and would approve "of a gold standard if it fixed the rupee." I have been authorised to state this on behalf of the following firms: Alexander Reid & Sons, Smith, Smith & Co., Robert Brown Limited, Robert Binning, W. Milne & Co., J. R. Russell, R. Cochrane & Co., R. R. Grier & Co., J. & M. P. Bell & Co., R. F. & J. Alexander & Co., Stephen Robertson, A. & B. Mackay, D. C. Paton & Co., and J. Lean & Sons.

9947. You say "if it fixed the rupee." Do you mean if it fixed the rupee at 1*s.* 4*d.*?—They merely asked for a fixed rupee. Then, in addition to that, I have been in communication with the manufacturers and dyers in the west of Scotland, and these are a very important class. I may mention that three of the firms whose names I have here employ between 5,000 and 6,000 employés; that will give you some idea of their importance. I am authorised by the following 14 firms, manufacturers and dyers of Glasgow, representing nearly the whole of these trades in the Glasgow district, and whose business is principally with India and Burma, to say, "that "they object most strongly to an unstable rupee, "find that their trade has been much benefited since "it became fixed at or near 1*s.* 4*d.*, and would deprecate any action which would bring matters back to "the old basis, whilst they would welcome any policy "which would give fixity to the rupee for the future. "Mr. Kinloch, of J. R. Cochrane & Co., muslin manufacturers; Mr. Alexander Maclaurin, of A. Y. Maclaurin & Co., muslin manufacturers; Mr. J. Pearson, "of J. J. Cochrane & Co., muslin manufacturers; "Mr. John Galloway, silk manufacturer; Mr. J. Frew, "silk manufacturer; Mr. Alexander Balfour, of A. "Balfour & Co., earthenware manufacturers; Mr. "James Fleming, of Cochrane & Fleming, earthenware manufacturers; Mr. Moir, of the Thornliebank "Company, Limited, calico printers; Mr. John Glen, "calico printer; Mr. Turner, of Wm. Turner & Co., "cotton yarn dyers; Mr. T. P. Miller, of T. P. Miller "& Co., Turkey red dyers; and Mr. John Christie, "Mr. Henry Brock, Mr. James Templeton, and Mr. "Maclaurin, all of the United Turkey Red Company, "Limited, comprising the firms of Archibald Orr "Ewing & Co., John Orr Ewing & Co., and Wm. "Stirling and Sons."

9948. Then, is the present period of suspense as to the currency policy of the Indian Government felt to be any grievance in Scotland?—All parties, whether they were for the opening of the mints or not, are agreed that the present state of suspense is very detrimental to trade, and they would certainly like it brought to a close as soon as possible. I may say with regard to the jute trade, in addition to what I have said, there are other things which put that trade in a very hampered position by the falling rupee. I have mentioned how Dundee is handicapped by the falling rupee, and the exports from India put in danger thereby. But in addition to that, they claim that, if you have the rupee at 2*s.*, then a mill in Calcutta would cost 10*l.* per spindle; of that 10*l.*, 4*l.* would be spent in labour in the erection of the mill. If the rupee falls to 1*s.*, that takes off 2*l.* per spindle from the cost of the mill, and to that extent over and above, by reason of the falling of the rupee, the Dundee manufacturers are handicapped as against the Calcutta mills.

9949. And, therefore, they are anxious to arrest the fall of the rupee?—Naturally.

9950. (*Mr. Campbell.*) You were alluding just now to the jute trade. You say that a high exchange tends to favour the Dundee manufacturer as against the Calcutta manufacturer?—The Dundee Mills think that they are placed at a disadvantage by the falling rupee.

9951. Is not that an argument in favour of a low exchange?—The Dundee people consider that if you, by having a falling exchange, handicap them, then it is in reality putting a tax on the export of jute, and benefiting the Calcutta manufacturer at the expense of Dundee.

9952. I presume it is in the interests of India that we are examining into this question now. Would you not say that anything that tended to drive the manufacture of jute out of India and into Dundee is bad for India?—It is really a question of holding an equal balance, not favouring one at the expense of the other, especially when, in seeking to favour India, you injure the export of India's raw material. If you stop the purchasing power of the Dundee manufacturers, they cannot purchase, and as a matter of course it strangles the export trade in jute.

9953. But I suppose the world would use jute goods supplied by Calcutta, as readily as jute goods supplied by Dundee?—It is possible that they will.

9954. Therefore if you do anything to favour the manufacture of jute in Calcutta, as compared with its manufacture in Dundee, you give India the benefit not only of growing jute, but of manufacturing it?—

You may do that, but you are doing it at the expense of Dundee, and I do not see that it is right to do that.

9955. The point I want to make is this. If a high exchange would handicap India in favour of Dundee, is not that an argument against a high exchange? If a low exchange would benefit India at the expense of Dundee, is not that, from the point of view of India, an argument in favour of a low exchange?—There should be no benefit conferred on one at the expense of another—that is in the end bad commercial policy.

9956. You are connected with several large steamship companies in India?—Yes.

9957. Of course you must have suffered considerably by the fall of exchange in the matter of remitting home your freights?—Yes.

9958. Have you found that this has been made up to you in any other way?—It has been made up in this way: we trade in Burma, and after the conquest of Upper Burma the country was developed very rapidly, and we have benefited very largely in consequence of that. Had it not been for the development of Burma in consequence of the change of Government, we would certainly have been in a very poor position.

9959. Then you attribute your prosperity more to the development of trade than to any other compensations?—I do.

9960. You agree that 1*s.* 4*d.* ought to be the rate?—It appears to me to be a reasonable figure.

9961. As regards the rate of 1*s.* 4*d.*, are you aware that the Government of India did not come to any final decision on that point in 1893?—I was not aware of that.

9962. Their proposal left the rate open to be fixed by the light of future experience?—I was not aware of that; but, taking it as it is, I think it is a very fair compromise.

9963. One object of the currency scheme was, was it not, to attract gold to India for currency purposes?—I know that was considered part of the scheme.

9964. Has it succeeded so far in doing that?—It could not possibly do so, because we are in an interregnum—we are in a time of transition, and no person who has gold to send there will do so until the medium of exchange becomes stable.

9965. But gold does go out there to some extent now?—I know it does, for certain purposes; but in the way you are speaking of, and in the way that the Government want, it would be absurd for people to send it out.

9966. It goes into the country because a better price can be got for it in the bazaar?—Exactly.

9967. Would not that be an argument in favour of 1*s.* 4*d.* being too high a rate?—No, it would be merely an argument that, the sooner the present state of suspense is put a stop to, the better. Instead of the banks removing their capital to this country, they would return to their old habit of having their capital in India with the view of lending it out for the development of the country.

9968. Would any capital go to India unless it was considered certain that the Government would be able to maintain the rupee at 1*s.* 4*d.*?—I am going on the supposition that this is a thing that will be accomplished. I am saying that when once the present state of suspense has come to an end, and when the Government has established a gold standard, with the rupee as a subsidiary coin linked to the sovereign at the value of 1*s.* 4*d.*, then the banks will return to the habit that they had previous to the falling of the rupee; that is, they will take back their capital to India for the purpose of loaning it out for the development of the country, and I suppose the capitalists will do the same as the banks.

9969. Then, how is Government going to manage that?—That is a matter for experts and not for me. I understand that the Government think they are perfectly able to do it, and I have faith in them. Then, again, I argue in this way, that if Germany, with the vast number of little States of which it was made up, and with the vast number of different coins that were in circulation, made the change from a silver to a gold currency, and unified that currency, I think the British Government will be able to do it also.

9970. But Germany was very much assisted by the large indemnity paid by France in gold, was she not?—To a considerable extent that was the case, but that indemnity is still unused; they have it hoarded up against any contingency in the future.

9971. Would you approve of the Government of India borrowing gold in order to establish a gold currency?—Certainly.

9972. You would?—I would.

9973. That is, they would borrow gold, take it out to India, and offer to let it out at 15 rupees to the sovereign?—Exactly, the sovereign for 15 rupees.

9974. Suppose the balance of trade were to go against India, in which case gold at that rate would make a good remittance home, would there not be a chance of the gold going away from the currency and returning to this country?—Of course, that is a danger that exists in the case of Germany and France and the United States, and would exist with any other country.

9975. But would there not be more danger of gold remitted in that way leaving the country again than of the gold which might be attracted to the country naturally through the ordinary operations of trade?—I do not think so, because the gold would, of necessity, get into circulation, and, in circulation, it would be in exactly the same position as the gold in any of these other countries.

9976. You say, there was no great monetary stringency in Burma?—There was none, excepting at that one period when the sudden demand came from India at the commencement of the famine for rice. The demand was very great, and it came suddenly, and there was a stringency then for a short time, but only for a short time.

9977. What period was that?—I cannot say exactly, but it was simply at the time of the famine; it was the demand for rice for the relief of the famine.

9978. About a year ago?—It is more than a year ago, in 1896 I think.

9979. Are you aware that from about November 1897 to about April or May 1898, money in Burma stood at 12 or 15 per cent.?—I am not aware that it stood so high as that excepting at that particular period, but I know that both in Burma and India at certain seasons of the year the discount and interest rates did go very high.

9980. (*Mr. Holland.*) I should like to ask a question in regard to one that was put to you by Mr. Campbell just now, touching the jute trade of Dundee and Calcutta, and with regard to the necessity of giving prominence to Indian interests. I suppose if there was a benefit to the Calcutta manufacturer, that benefit would not extend to the labour in the mills?—Only to an extent. I understand that labour has advanced to some extent, but not to the full extent.

9981. Then to the extent of the deficiency, the remuneration of labour would be practically reduced?—Yes.

9982. You are in favour of a gold standard, even without a gold currency, if a gold currency should not be found attainable?—I think that a gold standard with a gold currency is the thing that ought to be aimed at, but, if that is found to be impossible, I would certainly have the gold standard without the gold currency rather than return to the old system of things.

9983. In the course of your evidence you mentioned Argentina as an instance of a country where, although they had a gold standard, there had been a great deal of instability?—That instability would not have occurred, I think, if they had had a silver subsidiary currency; but they had a worthless paper currency, and that currency was issued just at the will of the Government in a great measure. When they were in

Mr. J. Galloway.

29 Nov. 1898.

straits they set the printing press to work and flooded the country with so many more notes.

9984. So that that is not the kind of gold standard that you would like to see adopted in India?—Certainly not.

9985. If there is to be a gold currency as well as a gold standard, would you admit the necessity of having the gold and silver on an equal footing in regard to each being legal tender for an unlimited amount?—That is a matter that belongs more to India than to here. I cannot speak with certainty as to that.

9986. You say in your evidence that Turkey-red dyers in the west of Scotland would welcome any policy which would give fixity to the rupee for the future: do you think that they would welcome such a policy even if it involved an international arrangement with the United States and France?—That is the bimetallic question. I suspect that if you were to introduce that question amongst them, you would probably find a difference of opinion, but I really cannot say what their opinion would be. With regard to myself, I am very strongly against it. What was before their minds when they signed the statement I have read was the policy by which a gold standard and a gold currency could be introduced into India. I can say for certain that that was what was before their minds when they made that statement. Such a thing as a bimetallic arrangement was not before them.

9987. (*Sir A. Dent.*) With reference to what you said about an export duty on tea from India, which you thought would be a very iniquitous tax, what would be your answer to the Indian and Ceylon planter who says that tea is already taxed by a 1*s.* 4*d.* exchange, and who also adds: "I would sooner have a "duty of 5 or 10 per cent., and my silver at bullion point, "than be taxed as I am by an exchange of 1*s.* 4*d.*"?—It seems to me to be a contradiction in terms for an arrangement to be made by which the rupee should fall for the benefit of the tea-planter, and that then you should put a tax upon him, destroying to a certain extent the benefit that you give him. It seems to me to be a contradiction that the two things should be coupled the one with the other.

9988. He thinks that a tax of 5 or 10 per cent. would put him in a better position than he is in now?—No doubt.

9989. Then about the Straits. You say that, if India were to go on a gold basis, the Straits would no doubt seek to follow suit?—Yes.

9990. Have you any special information about the Straits?—I have spoken with merchants dealing with the Straits, and that is their opinion. I was speaking to a merchant this morning, and he emphatically gave it as his opinion that the Straits would be glad, if India got a gold standard, to follow suit.

9991. Have you seen all the debates in the Singapore Chamber of Commerce on that subject?—I have not.

9992. In Singapore itself it seems they are very much divided?—It appears to me, whatever their opinion may be on this question, that they would be obliged to follow suit. It would never do, I think, for them to be on a silver basis and India on a gold basis; the connexion between the two countries, as well as between them and England, is too great.

9993. (*Sir D. Barbour.*) You said that, owing to the fluctuations in exchange, trade had been reduced to a gamble?—Yes.

9994. I daresay you are aware that evidence has been given by other persons to the effect that they were able very easily to get over that inconvenience to trade, chiefly by fixing their exchange forward?—I am aware of that; when I said it was reduced to a gamble, I was simply repeating the opinion of the exporters in Glasgow. In addition to that, they tell me that very frequently, when they had covered themselves forward, they found they would have been better off if they had not covered themselves forward—that they had really fallen into a trap. Moreover, it is plain that either the exporter or the bank must suffer, so that there is a loss either way.

9995. I am not arguing against your view. I was merely pointing out what others have said, in order that you might have an opportunity of expressing your views upon the subject?—I explain it in that way, and I am just repeating what has been said to me by the Glasgow exporters.

9996. Have you any practical experience of this matter yourself?—None. I am a carrier, not a merchant.

9997. I think you said you found that you could not raise fares and freights on your navigation steamers in order to meet the fall of exchange?—No.

9998. That is owing to competition by the boatmen and by the railways?—Yes; principally by the railway.

9999. I suppose that raising fares and freights has the effect of rather limiting the total amount of business?—It has, and I may say that, as the country advanced, and even before we had to face these oppositions, we reduced our fares of ourselves, because we did not consider that it was good policy to take advantage of the position that we were in.

10,000. Even when the rupee was falling in value, you found that, by lowering fares and freights, you got a larger amount of business which compensated for the reduction?—No, I did not say that. This company has been in existence since 1865, and therefore before the rupee began to fall. It was previous to that that I am speaking of. We did, on several occasions, in order to help trade, lower our freights, but since the rupee began to fall, the loss has been very serious to us.

10,001. Since 1873 you have not lowered fares or freights, is that so?—We have not lowered fares or freights.

10,002. Not since 1873?—Not since 1873. I am wrong in saying that we were not forced to lower our freights in consequence of the action of the railway. What I meant was that we did not lower freights for the reasons which, as I have explained, influenced us before; it was not in the hope of securing an increase of trade, it was in consequence of the railway lowering their rates.

10,003. I suppose you, acting independently of the railway, could not profitably raise your freights and fares?—No, unless to certain places not touched by the railway. Generally we could not.

10,004. And, on the other hand, I suppose the railway, acting by itself, could not raise its freights and fares either?—No, unless to certain places.

10,005. Taking it as a general thing it could not?—Certainly it could not.

10,006. Therefore the persons who argue that the loss to Government by the fall of exchange may be met in India by raising fares and freights upon the Government railways, may possibly be mistaken?—Quite so, and in this case it is so.

10,007. At any rate, it would not be safe to pronounce an opinion upon the subject unless you actually looked into the case of each railway?—Exactly.

10,008. Then you said you were very much afraid of illicit coinage?—Yes.

10,009. Why should there be more danger of illicit coinage in India than in England?—I presume that, being a larger country with a very large population, it would be more difficult to have police supervision; but, of course, as I have said, that is merely an opinion. I merely give it as a passing opinion. Government officials and those who are acquainted with the habits and customs of the people of India, are better able to speak as to that than I am.

10,010. At any rate, have you ever seen a rupee illicitly coined in good silver?—I am not aware that I have.

10,011. Have you ever seen any satisfactory evidence that such a rupee has ever been discovered by anybody?—No, but I may say that a Government official, Mr. Henry, made a report recently in which he seemed to indicate that illicit coinage was going on.

10,012. Does Mr. Henry say that he had ever discovered a rupee that had been illicitly coined in good silver?—No, he only said that he had a suspicion, and, of course, if a Government official has a suspicion, a private individual may have one also.

10,013. (*Sir F. Mowatt.*) Was it not also stated that a rupee made fraudulently from good silver would be so made that it could not be distinguished in the market?—That was stated.

10,014. (*Sir D. Barbour.*) But, although it could not be distinguished, it would be quite possible to detect a man making those rupees and to take the instruments from him?—Certainly.

10,015. You said the fall in exchange damaged the export trade in raw jute from India?—Exactly; that is the natural outcome of it.

10,016. Mr. Campbell asked you whether the result of that was not that the Calcutta manufacturer would manufacture the jute that was raised in India?—Yes.

10,017. I suppose our object should be to hold the scales fairly between the Calcutta manufacturer and the Dundee manufacturer?—Exactly, because the purchase of jute from Calcutta by the Dundee manufacturer is part of the trade of India.

10,018. They are both parts of the same Empire, and if we could get a fair rate of exchange, and could maintain that rate permanently, neither side would gain at the expense of the other?—That is exactly what I meant to say.

10,019. 1*s.* 4*d.* may or may not be the proper rate, but it is a rate which is fair, and, if exchange can be kept at 1*s.* 4*d.*, every interest will be fairly treated, and no interest will gain at the expense of another interest?—Exactly.

The witness withdrew.

SIR ROBERT GIFFEN, K.C.B., called and examined.

10,020. (*Chairman.*) You were the head of the Statistical and Commercial, afterwards the Commercial, Labour, and Statistical, Department of the Board of Trade for upwards of 20 years ending in 1897?—Yes. The name of the department was changed at different times, and the business increased a good deal, but it was always the same department.

10,021. You retired, I think, from the service of the Board of Trade last year?—Yes.

10,022. Previous to being at the Board of Trade, you were assistant editor of the *Economist* under Mr. Bagehot for eight years ending in 1876?—Yes, at the time that great changes were taking place in the monetary arrangements of different countries.

10,023. During the time that the great monetary changes were taking place from the adoption of the gold standard in Germany, the preparations for resuming specie payments in the United States, and the suspension of the silver coinage by the Latin Union?—Yes.

10,024. Mr. Bagehot also took a great interest in Indian finance?—Yes.

10,025. In 1879 you were a member of a committee for considering a proposal to stop the coinage of silver at the Indian mints?—Yes; that was the proposal of the Indian Government, of course, when it took an official form; but it was popularly known as Colonel Smith's.

10,026. I think the proposal then was to raise the rupee to 2*s.*?—That was the idea.

10,027. You wrote a memorandum upon the despatch of the Government of India relating to a gold standard?—That was for the use of the committee.

10,028. It was a departmental committee, I think?—A departmental committee meeting at this office.

10,029. A joint committee of the Treasury and of the India Office?—It was not a joint committee of the two departments, I think, because a good many people connected with India were members, and the Treasury, to the best of my recollection, were not specially represented, though they must have been consulted. I was at the Board of Trade at that time, and Lord Farrer, who was a member, was also at the Board of Trade, and I think we had one or two non-official members, to the best of my recollection, but they were chiefly India Office people who were connected with the committee.

10,030. There are two or three questions I should like to ask you about that memorandum of yours before we come to the question immediately before us, because that memorandum is a standard document in connexion with these matters?—I should say there were two memorandums. The first of these is the one you have printed here. That was specially dealing with the proposal of the Indian Government, and was for the use of the committee.

10,031. This is the "Memorandum on Despatch "of Government of India (No. 423 of 1878) relating "to a Gold Standard"?—Yes. That was the first memorandum and was specially for the Committee. The second one was not so much for the use of the committee, because it went a good deal beyond the reference. It was more for the use of the Indian Government, dealing with their position generally as affected by the fall of the rupee It was handed to Mr. Stanhope, who had been with us at the Board of Trade, but I am not aware that it was really part of the proceedings of the committee in the sense that the first memorandum was. With regard to the first memorandum, that forms part of the proceedings of the committee; with regard to the second, I have no objection—of course, circumstances have changed a good deal, and you must take things as you know them at the time—but I should have no objection to the whole of it being printed now. It is a matter for the discretion of the committee how they would use it.

10,032. Let us just go back to the first memorandum, and let me read you this extract from your remarks under the heading "The Alleged Evils." You say: "Coming to the second point mentioned, the mis-"leading and exaggerated character of the statements "as to the loss of the Indian Government by the fall "in the exchange, the first point to notice is the "assertion as to the probable duration of the present "fall in silver. The despatch asserts that 'the "'current of all the most trustworthy opinion tends "'more and more towards the conclusion that, so far "'as can now be foreseen' (that is in 1878) 'there "'is no prospect of an early or complete recovery in "'the value of silver and, on the contrary, that the "'probabilities are all in favour of a further fall'." At that time, in 1878, silver was at $54\frac{13}{16}d.$ the ounce. Then you go on there to say: "No opinion is cited to "this effect, and, so far from its being correct, the "contrary is undoubtedly the case. The late Mr. "Bagehot, as is well known, was of a contrary "opinion. He held that, from the nature of the "operation, there could be no great depreciation of "silver without an enormous increase of the export "of silver to India, and the demand for silver thus "arising would arrest the depreciation before it had "gone very far. Mr. Bagehot also entertained doubts "whether the rumoured production of the American "mines, which made so much noise several years ago, "would continue, and for this reason, also, he "looked forward to a recovery of silver when "the present causes of temporary depreciation, "such as the sale of the demonetised silver of "Germany, had passed away." Then you go on to say: "The actual falling off in the production of the "American mines has since confirmed Mr. Bagehot's "opinions in a very striking way. Mr. Goschen, it is "well known, while advocating the policy of waiting

Sir R. Giffen, K.C.B.

29 Nov. 1898.

"on other grounds, has also inclined to the opinion "that the price of silver would again rise, at least if "no such measure as that now suggested by the "Indian Government, still farther diminishing the "demand for silver, were taken." Now that was your opinion, and I have no doubt it was your very carefully considered opinion, 20 years ago. What I want you to tell us is whether that opinion is affected, and, if so, how it is affected, by the fact that silver which was then 54*d.* per ounce is now 27*d.* per ounce?—I am very glad that you have asked me that question, because I put it on my notes that probably, when the Committee read over my memorandum, that would be one of the points to which their attention would be directed. What I would like to say upon that subject is this: I think Mr. Bagehot's opinion, and the opinion of those who held with him, was quite justified at the time, but in forming an opinion of that kind you cannot make a judgment as to the entire future, because circumstances may arise—such circumstances, for instance, as those which have occurred with reference to gold in the great discoveries in the Transvaal and the more recent discoveries in Klondyke—which at a given time no one is able to foresee. The opinion which Mr. Bagehot was then expressing, and I agreed with him, was an opinion on the circumstances at the time, and I think that he has been fairly justified by the event; because, although the price of silver is now about 28*d.* instead of 54$\frac{1}{2}$*d.*, the great fall of silver did not come till the year 1892–3; in fact it was simultaneous with the closing of the mint itself.

10,033. It went to 43*d.* in 1888; then it went in 1892 to 45$\frac{1}{16}$*d.*; in 1893 to 39*d.*; then it has been steadily falling from that date. The Secretary of State's bills in 1878 were sold at about 20$\frac{3}{4}$*d.*?—Yes, in 1877–8. In 1878–9, when I was writing, the figure was 19·7*d.*, and, down to 1891–92, they did not fall below 16·7*d.*

10,034. In 1891 the figure was 1*s.* 6*d.*; in 1892, 16$\frac{3}{4}$*d.*; in 1892–93, 15*d.* practically?—The date at which I was writing was 1879, when the price was 52$\frac{1}{2}$*d.*, and the fall, down to 1891–92, was to 45*d.* Of course that is a considerable fall in a certain way, but it is not so extreme a fall as that which the Indian Government appeared to be contemplating, and it is not the same kind of fall that we have had since 1891–92. What really happened, I think, was that some years after Mr. Bagehot's time—a good many years after—the production of silver enormously increased. At the time we were writing, everybody was affected by the demonetisation of silver in Germany and by the operations in France, the Latin Union suspending the coinage of silver, and it was said that, mainly owing to these causes, there would be a great fall of silver. Writing specially with reference to all this, Mr. Bagehot was of opinion that the circumstances were such that the effect of these causes would, to a certain extent, be mitigated in the way he described. I think on the whole that that opinion was very well justified by the event—that you had not the unlimited fall and the kind of tremendous fall which was anticipated in 1879 by other people.

10,035. But Mr. Bagehot's opinion was that there would be no further fall. His opinion was "that there "could be no great depreciation of silver." There has been an enormous depreciation of silver since then?—Chiefly in 1891–92, owing to the increased production of silver which came long after the date at which Mr. Bagehot was writing.

10,036. No. The depreciation from 1872 to the time at which you were writing was about 6*d.*, and the depreciation from the time when Mr. Bagehot expressed his opinion up to 1886 was about another 6*d.*; that is exactly the same depreciation during that number of years as the depreciation which had alarmed the Indian Government. Your argument then was that not much value should be attached to the opinion of the Indian Government, which was that "There is "no prospect of an early or complete recovery in the "value of silver, and, on the contrary, that the pro-"babilities are all in favour of a further fall." I do not want to make it any stronger; I only want to know how you will deal with it to-day—whether it has or has not affected your mind to-day that there has been an enormous fall since then, no matter from what cause. Silver was then 4*s.* 6*d.* an ounce, and to-day it is 2*s.* 3*d.*?—In the second memorandum I discussed hypothetically the probability of an extreme fall. Before we leave this point I should like to call your attention to this. If you look at this table, you will see that when I was writing (that was in March 1879), the average rate of exchange in that year was 19·961*d.* In the following year it was 19·956*d*; in the following year, 1881–82, it was 19·895*d*; in 1882–83 it was 19·525*d*; in 1883–84 it was 19·536*d*; in 1884–85 it was 19·308*d.* So that you had six years of practically the same value of silver as that about which Mr. Bagehot was writing (or rather seven years including 1878–9). Mr. Bagehot wrote in 1876–7, partly at a date when silver had temporarily fallen to 47*d.*, and there was no immediate fall after he wrote of a very remarkable character. I think six years is a very long time indeed to which one can look forward. We do not write, in going into these matters, about what is going to happen a good many years hence; we can only look forward to what is going to happen immediately; and it seems to me that, although silver did not recover further after 1878–9, the actual facts which happened after the time at which Mr. Bagehot wrote, which was in 1876–77, are that, at most, you had from Mr. Bagehot's time a fall from 20*d.* to 19*d.* in the rupee on the average, and after the time at which I wrote you had a stationary condition of things for about six years. Whatever happened after that, I think was due to circumstances which could not very well be foreseen at that time. I admit, of course, that a fall has taken place, but we must not judge after the event altogether in these matters. We must take the circumstances of the time. Looking at it in that way, I think Mr. Bagehot was right, because you had not that immediate fall which people were expecting, but, on the contrary, you had a stationary condition of things for six years.

10,037. I do not think the Indian Government contemplated an unlimited fall. What the Indian Government contemplated was, "that there was no "prospect of an early or complete recovery in the "value of silver, and, on the contrary, that the pro-"babilities are all in favour of a further fall." Mr. Bagehot's opinion was "that the present causes of "temporary depreciation" would pass away, and that there would be a recovery?—I do not think he committed himself to the idea of a recovery, except with reference to the extreme depreciation of 1876–7 when he was writing. That would be an extreme thing to do.

10,038. But at that time the Indian Government's opinion was seriously criticised by the authorities of that day. Now I want to get your opinion whether, after the lapse of 20 years, the facts of to-day do not prove that the Indian Government were right?—I do not think the facts of to-day prove that the Indian Government were right, because what happened since was from causes which they did not foresee and did not pretend to foresee.

10,039. Then you deal with the statement that had been made, that all the important mercantile countries had adopted gold for their standard, and you say: "Unfortunately, a very large part of the world is on "a paper basis still, but the standard in which "countries like Austria and Russia will probably "resume will be silver, not gold"?—Yes, I have been disappointed in that illustration. I think they have chosen very unwisely, but still I admit that I have so far turned out to be wrong in that view.

10,040. Then, again, you say: "The countries "resembling India have therefore not only accepted "the fall in silver as India has done, but one of them, "Austria, has extended its use of silver. The asser-"tions in this paragraph as to the depreciation of silver "are therefore entirely erroneous. *Pro tanto* also, as "is admitted in the despatch, the legislation of the

" United States has been for the increased use of " silver. So far, therefore, from the general tendency " of legislation among the chief mercantile countries " being to diminish the use of silver, the one impor- " tant act in that direction has been the demonetisation " by Germany; all other legislation has either been in " favour of the increased use of silver, or has been for " the protection of a virtual gold standard against the " natural effect of bi-metallic regulations." As you say, nobody can foresee what is going to happen, but there again the course of events has rather proved that the gold standard has extended?—It is quite lately that Austria-Hungary has introduced the gold standard, and it was after many things had happened. It is the same with Russia. The introduction of a gold standard into Russia is quite a new thing. So that I think it is such an entirely new state of circumstances that it cannot have been foreseen in 1879. The point of my statement was that the use of silver had in fact increased, and that was quite true, and is still true.

10,041. But what I want is your opinion, as of to-day, on the two questions as to the fall in silver and as to the extension of a gold standard in the world? —As a matter of fact, I believe the introduction of an improved monetary system in Russia has been accompanied by a considerable use of silver there. They have taken a considerable amount of silver of late years that they were not taking in 1879. They have taken a great deal more gold.

10,042. They have got a great accumulation of gold?—They have got a great accumulation of gold, and it is the same in Austria, I think. But the use of silver was in fact extended a good deal after the date on which I wrote. I think it would have been better for both countries to have gone for gold, and I think it is extremely doubtful whether the gold standard in both countries will be maintained. It has not been tested very much as yet. They are just at the beginning of the operation, but, of course, as a matter of fact, you would call them gold standard countries at the present day, although I am not quite aware that the final step has been taken. I believe in Russia the people still prefer paper.

10,043. I suppose they prefer paper, just as the Scotchman prefers 1*l.* notes to sovereigns?—Just so.

10,044. Now that being so, what do you say as to your views in 1893 with reference to the closing of the mints?—I did not express my opinion publicly at that time, but I was not in favour of the step. Evidence was given by a great many friends of mine in 1892. I may particularly refer to Mr. Gairdner of Glasgow, as one to whose opinions I thoroughly adhered.

10,045. Will you tell us what were the main differences between what was done in 1893 and what was proposed in 1879?—Substantially I do not think there was much difference between the two ideas. The idea was in 1879 to stop the coinage of silver, to close the mints, and then to trust to the gradual contraction of the currency, which would follow from the increase of the population, to its being brought up to about 2*s.* It was then about 1*s.* 8*d.*, I believe; and they thought it would go to 2*s.* almost at once, and a good deal of criticism was directed to show that that was not a sound anticipation. After that, the idea was that gold would become legal tender and take the place of silver to a certain extent.

10,046. What was the exact proposal in 1879? My impression is that the Government proposed to make gold unlimited tender?—I believe that was intended after they got it up to 2*s.* There was not much use in proposing it till the rupee got to 2*s.*

10,047. The sovereign was proposed to be taken as legal tender?—Yes.

10,048. The sovereign was to be taken at 10 rupees?—Yes, but that was rather postponed till the rupee got up from 1*s.* 8*d.* to 2*s.*; it was not an immediate thing, of course.

10,049. Will you tell us, after an experience of five years, on what ground you did disapprove, and as we know you still disapprove, of the closing of the mints?

Sir R. Giffen, K.C.B.

29 Nov. 1898.

—There are two questions. There is the provisional stage, and then there is the question of the gold standard itself. I took a great deal of objection to the reasons assigned for the proposals altogether. I was very much dissatisfied with the reason assigned for the proposal, viz:—that the Indian Government was likely to be, or would be, involved in a deficit which could not be dealt with unless you made sure of keeping up the value of the rupee, and, of course, at that time the idea was not merely to keep it up (I am speaking of 1879) but to raise it to 2*s.* I do not think that in 1893 the proposal was so objectionable, on the ground of raising the rupee from the point at which it stood, as was the proposal with which I was dealing in 1879; because in 1893 the rupee was 1*s.* 2½*d.*, and had only just fallen to that point; and the proposal to fix it at 1*s.* 4*d.*, if that had been all the proposal, would not have been so very objectionable as the similar proposal in 1879. There would have been great objections, I think, to the idea of raising it from 1*s.* 2½*d.* to 1*s.* 6*d.*, because that was a much greater change than the raising of it from 1*s.* 2½*d.* to 1*s.* 4*d.* But the objection to such a provisional state of things was, as I pointed out very fully in my first memorandum, that you introduced a managed currency—a currency that you had to manage; it would not be an automatic metallic standard money, such as was recognized to be the best. Then I pointed out that you could not be sure that such a kind of money would be free from fluctuations itself, and I dwelt very emphatically, quoting from American experience, on the point that probably the provisional state of things would last much longer than the proposers of that state of things expected. I saw nothing in the papers that I recollect as to what idea the Indian Government in 1892 or 1893 had as to the length of time over which the provisional state of things would last—the state of things before the stoppage of the mints would raise the rupee to 1*s.* 4*d.* or 1*s.* 6*d.*, or any other figure that was thought of—but I think experience since 1893 has fully justified the anticipation which I expressed in 1879, that probably the provisional state of things would be much more lasting than people supposed, and that a great deal of harm might happen.

10,050. A great deal of harm might happen in the meanwhile?—Yes, during that period. That was the general idea that I had, but I think, as my opinion about it is being asked generally, I ought to go a little into the question of the necessity of the step altogether. We must all admit that a step of this kind is a very serious thing, and, unless there is good ground for it, it is not a thing which any government ought to undertake. My opinion was based, and is still based, very much on the idea that the proof of the deficit and of the serious disturbance of the finances of the Government has not been sufficient, that the thing ought to have been taken more calmly, and that probably it would have been found after an interval of time that, even with a very great fall of the rupee as compared with gold, the finances of India would have come right. I am disposed to give every credit to the statements made by responsible members of the Indian Government to the effect that the limit of taxation had been reached, and that the only way to avert a deficit in consequence of the fall of the rupee was to alter the money of the country so as to preserve the value of the rupee in relation to sterling, but, I think, perhaps, they proved too much in the case they put forward. What has been done—I am speaking with reference to the evidence which has been given before this Committee by Indian officials, and similar evidence given before Lord Herschell's Committee—is to go over the list of taxes in India, and to show that the land revenue, for instance, cannot be increased at once without breach of contract, and that there are difficulties in the way of imposing new import duties, and so on. I think the matter ought to be looked at in a more general way. It is not merely sufficient to go over the list of taxes in this manner, because, when you have such a great change happening as a fall in

Sir R. Giffen, K.C.B.

29 Nov. 1898.

the value of money, many other changes are certain to happen. You must not reason about the difficulty of finding more rupees now, as if you will find the same difficulty two or three years afterwards when the fall of the rupee has had its effect. Then the difficulty I have in accepting the conclusion that you cannot increase the number of rupees that you obtain from the community of India, or that you cannot increase the taxation, or that you cannot find the means of meeting your gold obligations, is this:—The community of India—the Government and the people together—are not affected in any way by changes in the value of their own money with reference to any foreign money in which their obligations have to be paid. As far as the community of India is concerned, the gold to be paid in London is the same thing whatever their money is. It occurred to me, in writing about the subject at a very early time, to ask this question: Is the position of India, or of any silver standard country, different in any way from that of a gold standard country as regards the gold debt which it has to pay? We see that the government is embarrassed a little, but is the gold debt really a greater burden to them in consequence of the change in the value of money in relation to sterling than is the gold debt of a country like Australia for instance? Australia was very much in my mind at the time I wrote this, and I said, if it be true that a fall in the value of money of a country of silver standard affects its power to pay gold debts, then the position of countries whose obligations are in gold must surely be worse, because everything they have to pay is in gold. Then, if India was worse off in consequence of its gold debt, Australia must be still worse off, because all its obligations, everything it had to pay, was in gold, whereas in India a good deal had to be paid in silver. My view is that the gold debt is paid undoubtedly by the remittance of surplus produce from India, the magnitude of which depends upon the yield of harvests and the value for which the produce can be sold in the money which has to be obtained outside India. What the money of India may be has thus no relation whatsoever to the debt that has to be paid. As between the Government and the people, there may be embarrassment and friction of some kind in providing means to meet the debt, but the debt itself is no greater and no less on account of the money of India being different from that of the money in which the debt has to be paid. Then I put two cases, just as I did in the second memorandum which is before you. If the debt should happen to be increased, as far as India is concerned, by the necessity for sending a larger amount of produce than formerly to meet the debt, this being the result of the increased purchasing power of the gold, the case is one in which there must be increased taxation in some form or other if India is to be solvent. That is a case where the gold debt really increases, and you have to send more produce to pay it. Either there must be new taxes *eo nomine*, or the old taxes must be made to command more produce by an artificial enhancement of the value of your own money; and in either case the final result is the same, there is an increase of the taxation of the people of India of an entirely unavoidable kind. Then I take the second case, that of your money really depreciating. If the case is one in which the same produce has to be sent from India as before, but the Indian Government is not able to command the same produce in consequence of the depreciation of its money, then what the Indian Government loses at the moment, through its revenue not being sufficient to obtain command of the produce required to pay its gold debt, clearly amounts to a remission of taxation of equal amount to the people of India.

10,051. Will you just explain that a little?—I am dealing here with produce. My idea is that, if you send less produce to England, so that you are not quite able to pay your gold debt, then the Indian community, as a whole, has that produce in its possession. It "fructifies in the pockets of the "people"—to use a very old phrase in connexion with these matters.

10,052. Given the same quantity of produce and the same gold price in London, in the one case a certain amount of money in India will buy that gold, and in another case you must double that amount?—Yes.

10,053. But I want to see where you say that that is a remission of taxation?—It is a remission of taxation in that the community of India does not contribute the produce. If the taxes remain the same until you make the change, the people of India do not contribute the produce; the Government is short of so much produce. But what I say is the people of India have it.

10,054. Take a concrete case of sending to London a quarter of wheat, the gold price of which is, say, 2*l*. That 2*l*. would have taken, so many years ago, 20 rupees; it would be worth 20 rupees. Now, assume that the price has altered, so that it is worth 40 rupees. Just tell me how that affects India?—That is a case in which India is sending the same thing, and I am assuming that, owing to the fall in the value of money, the Indian Government is not able to command the same produce. You are assuming that it is able to command the same produce.

10,055. No, I do not want to assume anything. I just want to understand the position before we get further, applying it both to an import and to an export?—Of course, I am applying it to the case of exports.

10,056. What I understood you to say is this—and I do not dispute that for a moment—no matter for what purpose, India has an obligation to find so many sovereigns in London; those sovereigns can only be obtained by the export of Indian produce; Indian taxes are paid in Indian money; the gold has to be provided out of the taxes. If the gold requires twice as much taxation when the rupee is at 1*s*. as it requires when the rupee is at 2*s*., I want you to tell me how that works out; in other words, if India is called upon to find an additional quantity of rupees, how does that amount to a remission of Indian taxation?—India does not send the rupees. I think you are repeating, if I may say so, the first case that I gave you. I quite admit that, if the Indian Government has to send a larger share of the produce of the country, that leads to unavoidable taxation. You must either have it by imposing new taxes, or by increasing the value of the money in which your taxes are paid. But the case I am dealing with now is a case in which the Indian Government sends the same produce.

10,057. The same quantity?—The same quantity and the same value in gold. The same produce must command the same gold in London in the case which I am now putting. The case I am putting is that you send the same produce commanding the same quantity of gold, but the rupees which the Indian Government obtains in India are not sufficient to buy the same produce that it sent before. Then, I say, if it gets rupees that are not able to buy the same produce, but gets a less amount of produce so that it has not got quite sufficient to pay its gold debt in London, that amounts to a remission of taxation to the people of India.

10,058. By the retention of the produce?—By the retention of the produce. I hope I have made that quite clear, because it is a little difficult to follow.

10,059. (*Sir F. Mowatt.*) Of course the result of that is that the debt is not paid?—The debt is not paid, but still the money is fructifying in the pockets of the people. The problem in the case supposed then becomes, not how to increase taxation as compared with what it was before, but how to make the taxation equivalent to what it was before. For this purpose new taxes may be necessary; but this is not new taxation on the community generally: the burden of taxation after they are imposed is not any greater than

it was before the depreciation of the money had taken place.

10,060. Then do I understand that you view the new taxation as a substitute for that part of the produce which remains in the pockets of the people?—Yes. It is to take out of the people the produce which the old taxes are unable to take out of them. For this reason the statements of responsible officials in India that new taxes cannot be imposed in the latter case comes to this: that there is a mechanical difficulty in imposing upon the Indian people, not an increase of taxation, but the same taxation that was imposed upon them before the depreciation of the rupee. This is a conclusion which it seems to me most difficult to accept. In the former case, also, that of a real increase of the burden of India through more produce having to be sent to obtain the gold necessary, I think we must hesitate to accept the statement that the taxation of India can be really increased by means of an artificial enhancement of the value of the money, and that it cannot be increased by imposing openly new taxes. That seems to me to be "a large order," as Mr. Bagehot would have said. Then with regard to the other statements made as to the difficulty of imposing new taxes, I do not feel prepared to go into these statements generally in detail, and discuss the matter with the responsible officials of the Government of India, who have been on the spot and who know the circumstances of the people as I cannot pretend to do. I notice, therefore, merely the question of particular items of revenue on two points. One is with reference to the railway charges. I say we must assume the railway charges, which are charges for services done in the way of business, to be modifiable in a way that ordinary taxes are not. I may mention, with regard to that, that English companies in the Argentine have had that experience, and that they have varied the charges for goods and passengers in accordance with the changes in the value of their inconvertible paper. It is a thing that can be done, and that business people do when the difficulty arises. It seems to me that what private companies can do in the case of Argentina, the Indian Government must also be able to do in the case of its own railways.

10,061. That is to say, raise the fares as the value of the rupee falls?—I mean, you must treat it as a business; and, if you are not getting so much, owing to the rupee being depreciated, you must alter your fares. Of course that is a work of time, and it must be a matter of careful consideration and detail, but the thing is what ought to be done.

10,062. (*Sir D. Barbour.*) You do not mean varying from day to day?—Oh, no.

10,063. (*Sir F. Mowatt.*) Not automatically, varying with the changes in the value of the rupee?—I do not propose anything automatic: that would be quite impracticable.

10,064 (*Chairman.*) But you are not representing that as part of the taxation of India?—It is practically part of the taxation of India. It is a large part of the income of the Government.

10,065. You have passed over the land revenue altogether. I do not admit that the land revenue is taxation; nevertheless it is revenue, and the revenue now from land is 26 crores, which is a very large sum out of the real net income of India; it is a third to a half of it, I think?—I am not prepared, as I said, to go into the question of the revenue of India in detail with the officials.

10,066. I do not want you to do that; but you said that you considered that this was a "mechanical difficulty" with reference to imposing taxation, and, without going into detail, I want to show you that there are only four or five great items of revenue in India. The first item is land revenue, that is paid in rupees as you know, and in Bengal it is fixed for ever; it does not vary at all. In the rest of India where there is no permanent settlement, it is subject to a re-settlement once in 30 years. Now I want to know whether you think it would be possible for us to increase that revenue on the ground of the rupee having fallen in value?—I am not prepared to go into the question of the land revenue or to discuss the whole subject generally. I think it is necessary for me to say that, because it would not be a proper thing for people outside India, like myself, to go into matters of detail of that kind. I am merely mentioning one or two points where, without knowing the particular circumstances of India, one may say that there is something which can be done, and this matter of railway working is one thing about which we have general knowledge and know what happens in other countries. The gross income of railways, according to the Statistical Abstract of India, is a very large item—I think about as large as the income from land revenue; about Rx.25,000,000, is the latest figure I have; therefore it is a very considerable figure, which is absolutely modifiable in my judgment, although the land revenue would not be. That is all I am putting with reference to it, that you must not treat it as if this large item was itself quite unchangeable; because, if the rupee depreciates, this is a sum which I should hold, speaking from general experience, is capable of modification.

10,067. Of course, the Government of India does not own all the railways; there are some companies that were in existence before the Crown took over the government of India, and there are private companies that have been formed since; but you mean, the Government might, so far as its power extended, raise railway rates and fares; that is what it comes to?—Yes.

10,068. But, after all, that is merely a bagatelle in this question. We are dealing with a deficit which is put at from 10 to 12 crores. As you have now raised this question of additional taxation, let me put this to you. In order to enable the Government of India to meet its liabilities, it would require an amount varying from 8 to 9 crores (I think that is the lowest estimate) to 12 crores, which is the figure put by Mr. O'Conor. Now what we want to know when we talk of taxation is, where is it to be found. We know we cannot find it out of the land revenue; we know we cannot find it out of the opium revenue. It would not be wise to double the salt tax. Where is it to come from? You say it is a "mechanical difficulty." Let me put a parallel case. Suppose in this country the Chancellor of the Exchequer, there being no income tax, was called upon to find 20,000,000*l.* a year more; somebody would have to point out to him how it could be done?—No doubt in a country like this, where there is any amount of public discussion and where we know, and are familiar with, the sources of revenue, the Chancellor of the Exchequer would get a good many hints.

10,069. But you say you are putting this consideration on one side?—I am putting it on one side because I am holding a critical position; I am criticising the statements you have made; but it does not follow that I should be expected to tell you how to make up the budget of the Indian Government. That is perhaps rather going too far, but, by way of criticism, when you say that you have got to the limit of taxation, I point out that, as regards one large item of revenue, Rx. 25,000,000, quite as large an item as the land revenue, it is modifiable to any extent, and it seems to me quite clear that, if the rupee was to go down from 1*s.* 4*d.* to 10*d.*, which would be an enormous change, you ought fairly to expect, if that is the real depreciation of the rupee, that these receipts from railway working should be almost doubled.

10,070. (*Mr. Hambro.*) Do you make the railway receipts Rx. 25,000,000?—I quote the figure from the "Statistical Abstract for India." Of course, I am subject to any correction which may be made by those better acquainted with the figures.

10,071. (*Sir D. Barbour.*) I should think it is the *gross* receipts which would come to about that?—There is expenditure on the other side, which would also increase, but there is no doubt you ought to have a considerable increase in that way.

Sir R. Giffen, K.C.B.

29 Nov. 1898.

10,072. (*Sir F. Mowatt.*) Without affecting the traffic?—Without affecting the traffic. You are really putting on the same charges that you have now, but you are providing for the depreciation of the rupee.

10,073. (*Chairman.*) In the year 1896–7—it was better I know in 1897–8—but in 1896–7 the net loss on the working of the Indian Railways was Rx. 2,609,000 owing to the charge for exchange?—As I say, I am not going to make up a budget for the Indian Government.

10,074. No, but I want you to see that this spring, which you think is a good one to tap, is already almost exhausted?—It might happen in this case, as it happens in many other things, that it would be better for the Indian Government to reduce its charges. I do not know how that may be; it is a question of business.

10,075. The suggestion you make, so far, is that by an increase in railway fares and freights there might be an increased profit to the Government of India?—Yes. I am suggesting that by way of criticism, as I have said. Then the other thing I should suggest by way of criticism is with reference to import duties. I know that that has been the subject of a great deal of discussion in India and in this country too, and it has been said that there would be great difficulties with the House of Commons in inducing them to consent to imposing what I should consider would amount to fair import duties in a country in the economic circumstances of India. I have looked at the Indian Customs Tariff a little. According to my experience of Customs Tariffs, it seems to me that the Indian Customs Tariff is one of the lowest that I have gone through amongst countries in a similar economic position. It comes to about something like 5 per cent. *ad valorem*, and a good many articles, I think, are admitted free. I do not think it worth while to go into detail very much, but it appears to me that it ought to be possible in some way to raise a good deal more money than is done in India by means of Customs duties generally, but I speak especially of import duties, as there are great and special objections to duties upon exports. How much could be done is really a question that cannot be settled without going into the whole subject, as the officials in India who would be responsible for the matter would have to do; but, speaking broadly, the fact of a 5 per cent. *ad valorem* rate of duty in India shows to my mind that this source of income has not been gone into and made the most of by the Government of India. With regard to the objection that the House of Commons would not permit you to put import duties on certain classes of goods, what one would say is that, if import duties of that kind are really required in the circumstances of India, the interference of the House of Commons in that way, in preventing the Indian Government raising its income in a proper manner, and compelling them in a way to alter the money of the country, would not be justified. It would show that the House of Commons is not qualified to be the ultimate Government of the people of India.

10,076. I do not think anybody has said that there would be any difficulty in the House of Commons. The difficulty that has been pointed out here is that there possibly would be, and I have had painful experience of it, considerable difficulty with the English manufacturers in relation to any proposition that their goods should be taxed with import duties, unless there were corresponding Excise duties put on in India?—I do not like to speak in any absolute manner about it but I fear that in point of fact the objection has gone a little farther than that.

10,077. As far as it has gone in this room, it is this: Mr. O'Conor, who is the best authority we have on the point, has told us that, if we could double the present Indian import duties, the additional revenue would not come to more than three crores?—But three crores is a considerable item.

10,078. Out of 12 crores?—I call it a considerable item, but, of course, I am not making up a budget for the Government of India.

10,079. (*Sir F. Mowatt.*) But you are contemplating a considerable increase of that sort?—Yes. It might be that, in the case of some goods, you might even more than double the duty. If you go through the tariffs of our other Colonies, and see what is done all over the world, you will see that the import duties of India are not high, but extremely low. Then, I think, in a question of a serious deficit of this kind, so far as I have been able to judge, sufficient stress has not been laid upon the regular growth of revenue in India; that, if you are met by a case of sudden deficit happening from any cause, it is quite possible that, although you may not fill up the deficit all at once, and that would not be easy to do, still, you may know, if you have patience and wait a little, in two or three or five years the natural growth of the revenue may help you very much to fill up the deficit, and that you ought not merely to decide on the actual facts of the moment. That, of course, is again a question of detail for the consideration of the Government of India from year to year, and I am merely making the criticism upon the statements that have been made from time to time.

10,080. (*Chairman.*) I should like to put one figure to you there. In the 20 years ending with 1892–3—that is, ending in March 1893, just before the closing of the mints—there was an aggregate surplus of Rx. 17,000,000 and an aggregate deficit of over Rx. 19,000,000, the nett deficit amounting to Rx. 2,398,000. That was the result of 20 years' finance during the time when India was supposed to be extremely prosperous. Of course that accounts for all the normal increase which you have been mentioning?—That enables me to say, what I have often thought and what has never been dwelt upon very much, that, so far as my judgment goes, Indian finance on the whole has been exceedingly prosperous, that there are very few countries in the world indeed which can show such a good record for 20 years, that actually you have gone through these 20 years with so small a deficit in the aggregate. I think also, if the thing were looked into, it would be found that the permanent burden of India has not been increased in any substantial way even by borrowing for new works, but that considerable conversions of the debt have been effected. I must speak with all diffidence, but I have a strong impression that the permanent indebtedness of India did not increase, or at all events did not materially increase, during all that time, so that I think we may say that India has had a prosperous period. That would be one reason the more for being very careful with any deficit when it comes suddenly, and not to be in too great haste to take quick and rash measures, but to take time to consider what ought to be done. The Government in India appears to me also excessively apprehensive about a sudden deficit arising from a change in its money with reference to gold. I do not wish to speak lightly of financial troubles, but, in a country like India, a sudden deficit ought to be faced calmly, and there ought not to be an attempt, such as would be justifiable in a rich country like England, to meet that deficit at once. Time ought to be taken to give room for the ordinary sources of revenue to grow, and to find out the means of adding to the taxation, if necessary. Some of the mischief in dealing with Indian finance appears to me to arise from the hurry to make good a deficit, which in the circumstances of a country like India should only be attempted by slow methods. The experience and practice of finance in England are not quite models for a stationary country like India, and an example that is more to the point would be that of Italy after its unity was established in 1859–62, where many years passed before the annual deficit with which the United Italy started was finally extinguished.

10,081. (*Sir F. Mowatt.*) "Finally extinguished"?—From their point of view it was extinguished.

10,082. But finally extinguished?—I do not mean that in totally new circumstances you may not have a new deficit, but the deficit which the people who made the unity of Italy had to find in the sixties and seventies was finally extinguished. That deficit was about 15,000,000*l.* sterling upon an expenditure of 35,000,000*l.*, so that it was really an enormous deficit. The financiers of Italy and all the people were occupied for years in finding new taxes. I happen to know the case well, as I had to write a great deal about Italian finance at that time. They made a genuine and honest effort at that time to cover up that deficit, and they finally succeeded; not all at once, but they put the finances of Italy right in about 15 years. No doubt Italy has gone wrong since then, but that does not alter the fact that, in circumstances of great difficulty, they managed, slowly and painfully, to make good the deficit. The last point I shall mention with reference to this question of finance is that there is reason for suggesting in all the circumstances that the whole question of Indian expenditure should itself be reviewed. The statements I have seen are confined almost exclusively to the question whether more taxes can be imposed in India or not, but in financial questions the other side of the matter should be looked at also. It may be the case, and I fear it is the case, that the Imperial Government unfairly charges a great amount of expenditure to India which ought rather to be borne by the Empire in general. The army in India is maintained, not exclusively for the advantage of the Indian people, but also for the general benefit of the British Empire. It may then be possible to make the deficit in India more manageable than has been represented, and thus avert the supposed necessity for altering the money of India. That is perhaps trenching upon the domain of politics very much, and, as we all know, there has been a Royal Commission sitting for some time under the chairmanship of Lord Welby, dealing with the question of what ought to be charged to India and what ought not to be charged in respect of military and other expenditure; but I should like to put very strongly the impression which I have formed that in this matter India substantially is not dealt with in a fair manner, and that something ought to be allowed for the advantage which the Empire in general gets from the existence of the European army in India, which is not exclusively for the benefit of the Indian people. I should say that from 3,000,000*l.* to 4,000,000*l.* sterling is the idea that I have formed as to what ought to be deducted from the permanent charge upon India. This, then, is the main ground, that is the want of proof as to a deficit, upon which I take the objection to the alteration of the money of India, and, of course, there remain all the objections to the nature of that alteration itself. With regard to the first part of it, that of the transitional state which was established in 1893, I think I should confine myself to saying that apparently the objections which I brought in my memorandum of 1879 have been justified so far that you have had a good deal of trouble and distress in India in consequence of the forced contraction of the currency with a view to raising its value. You have had also considerable fluctuations in the value of that monopoly currency since the change was made in 1893.

10,083. (*Chairman.*) Do you mean by fluctuations, variations?—Yes.

10,084. Up and down?—Up and down.

10,085. But is that so?—You had, first of all, the variation from 1*s.* 2½*d.* down to 1*s.* 0½*d.*, I think, in the earlier years after the change was made.

10,086. If I am right, the lowest figure it ever touched was in 1894?—But the change was made in 1893.

10,087. But it did not come into actual operation for 12 months?—Of course I know all the special reasons that are assigned for it.

10,088. But once the thing was fairly started, say in 1894-95, has not the rupee been steadily rising?—After that, yes, but there have been some fluctuations since. I should not like to say that, since the thing was fairly started, as you phrase it, it has been steady, because the period since then has been short; but, taking the whole period from 1893 to the present time you have had a good many fluctuations, and it remain, to be seen whether you may not still have fluctuations—whether this improvement which commenced in 1896, or something like that, will really be so lasting as you think it will be. Up to now you have had fluctuations.

10,089. In 1893 it was 1*s.* 2½*d.*; in 1894-95 it was 1*s.* 1*d.*; in 1895-96 it was 1*s.* 1¾*d.*; in 1896-97 it was 1*s.* 2½*d.*; in 1897-98 it was over 1*s.* 3¼*d.*, and I suppose this year it will be 1*s.* 3½*d.*?—I should have thought almost more than that, but however, after the change was made, I am pointing out that we have not been free from fluctuations, whatever the cause may be. The other things stated in the 1879 memorandum which seem to me to have been fairly justified by the event are, first, the anticipation that you would have times of considerable dearness in the money market whilst the process of appreciation was going on. I hardly remember now whether I said so in my memorandum of 1879 or not, but, as a matter of fact, I think there is hardly a case of money appreciating by reason of a contraction or refusal to add to the amount, in which you have not, at some time or other, had difficulties in the money market. The case I remember best is that of the United States Government between 1865 and 1878, whilst their inconvertible paper was being brought up to gold value. You had several times of enormous difficulty in the money market—great stringencies of money and difficulties of that kind. Then, again, in this country we had some difficulties of the same kind when we were returning to specie payments. I think in Argentina they have had difficulties of a similar kind. With reference to a case that has been mentioned frequently in these matters, that of Java, I believe when the system of making the coinage there equivalent to gold was introduced, you also had a time of very considerable stringency in the money market at the beginning of that period. Whatever may be the cause of stringency in the money market, I do not think you can say that any measure for contracting a currency and making it of greater value is likely to be carried through without periods of considerable stringency in the money market.

10,090. Then about the question of a gold standard?—I have formed an opinion upon two points: the one is as to the question of a gold standard, if it is introduced in what I should allow to be a proper manner, and the other is as to the objections to the particular method now in question of introducing a gold standard.

10,091. Will you take the general question first?—Taking the general question, I am inclined to doubt very much whether a gold standard would in any case be the suitable standard for India. The general objection to a gold standard for India is that the main currency, whatever the standard is, would be in silver all the same, so that silver is the natural standard for India, if we are to secure identity between the standard and the principal metallic currency, which is, in my opinion, a desirable object. I do not know whether I should say very much upon this point of a metallic currency being the same as the standard, but it really is a very important matter.

10,092. It seems to me a very important point, and we should like your views upon it?—I should like to say that this enters into the whole discussions about money in the earlier part of this century in this country. A strong opinion existed against paper issues of small denominations, on the express ground that they would drive money of the standard out of the country, and that you ought to have money of the standard circulating in the hands of the people. I do not think I can give you any reference to any published book on the subject, but that was really the essence of the views of the leading men of those days, about which I can speak to some extent from my

Sir R. Giffen, K.C.B.

29 Nov. 1898.

reading, and to some extent from my acquaintance with Mr. Bagehot and older people acquainted with the currency controversies of that time. They looked with great apprehension upon the issue of notes of small denominations, because the issue of those notes would tend to drive the principal standard coinage out of the circulation. I may say that I found a similar opinion in the course of my reading about currency matters in France. I found that, when the Bank of France was established, in 1803, in the Napoleonic time, the circulation of notes in France was limited to notes of the denomination of 20*l.*, that is 500 francs, and upwards. It did not go below that point, because it was considered injudicious to have notes of small denominations. Afterwards the limit was lowered, but I am speaking here of the state of opinion in the early part of the century. There is an obvious convenience in having actual standard money circulating in a country, and these were certainly the opinions of the founders of the present monetary system in England, and they agreed with the general opinion of that time, that paper of small denominations was not desirable, because it would deprive the country of the coins of the standard substance in actual use in circulation. Even if India had a gold standard, the reserves and the till-money of bankers and leading merchants throughout the country would continue to be in silver (because that is the usual money of the people), and any gold reserve kept in order to maintain these various currencies at a level with gold would be additional to the usual money arrangements of the country. There would consequently be two reserves, one in silver and one in gold, and, apart from the complication, this would be a heavy burden to the community.

10,093. But is not that so in this country at this moment? What does a country banker keep his reserves in; he keeps them in notes, does he not?—And in gold.

10,094. Not much in gold?—In gold to some extent.

10,095. But the great bulk, I presume, of a bank's reserve is in Bank of England notes?—I should not like to go into detail upon a point of that kind, because I believe there are great difficulties in ascertaining what the facts are, but a considerable amount of gold is kept by the banks in this country. I mean considerable in proportion to the total gold in circulation. Even in England, it may be pointed out that there are silver reserves and till-money in the banks, and even copper reserves and till-money, although gold is the standard. These things are unimportant in England, because the gold currency so much preponderates. On that point I think I may mention figures which you will find in the report of Mr. Roosevelt to the American Government, which has been published in some papers upon currency by the American Government. I quote this because I happen to know the origin of that report and the figures that Mr. Roosevelt gives. The silver currency in this country may be taken to amount to something about 22,000,000*l.*, I do not know what the exact figure may be. The circulation of gold is about 60,000,000*l.* I mean by that, gold in the hands of the people, as distinguished from what is in banks and what is in the Bank of England. So that the silver currency in this country is unimportant compared with the gold currency.

10,096. But are you deducting what is in the Bank of England?—No, I was just going to mention what happened. In addition to that 60,000,000*l.*, you have about 30,000,000*l.* in sovereigns in the Bank of England and in the country banks taken together. In addition to that, you have 30,000,000*l.* of bullion in the Bank of England itself—that was two years ago; I do not suppose that the figures will be quite the same now, but the 60,000,000*l.* I spoke of was the gold currency in the hands of the people.

10,097. That is purely an estimate, I suppose; you have no figures about that?—I think to some extent those figures are taken from the Mint report; they are not purely estimates.

10,098. (*Sir F. Mowatt.*) Your figures only give 90,000,000*l.* in sovereigns?—Yes. Practically I happen to know that the report of Mr. Rooseveldt was based to a large extent upon the actual figures of the Mint report, because it was an official report made by Mr Roosevelt to his Government about the circulation in this country; and the figures as to the bullion held in the Bank of England, as distinguished from other bullion, were as a matter of fact obtained by me from the Bank of England for the information of Mr. Roosevelt.

10,099. (*Chairman.*) Your point is that there is a preponderance of gold currency in this country as well as silver currency, and that in India the bulk of the currency must still remain in silver, and therefore you consider the standard should be in the same metal as the bulk of the currency?—That is really what it comes to, but I may also point out this important fact, that, when you have token currency, the banks have to keep till-money at any rate, and sometimes other money, in reserve, so as to meet the demands for these token currencies, and sometimes that may be an important matter. In India, if your preponderating currency is a token currency of silver, you would have to prepare to have a reserve of till-money and token money in silver because of the mere fact that silver was the preponderating currency.

10,100. That, you say, would not reduce the gold reserve which you would have to keep?—If you are to have a gold reserve to preserve the convertibility of your token money into gold, the amount of that reserve would have to be determined on different conditions, and practically the result would be that you would have two reserves. That is what you would have to fear. I may say that, with regard to the possibility of a gold currency which India might use, I regret very much that I see no statement in detail by those who are well acquainted with the circumstances of India, as to what the amount, or the probable amount, of such currency would be, supposing the thing were to be begun to-morrow.

10,101. Are you talking of gold standard or gold currency?—Gold currency. The impression I gather from the evidence of Lord Northbrook—which I have had the opportunity of reading—is that in his opinion a certain amount of gold would come out and be used as currency in India. The point I am on now is, what figure would you put upon it?

10,102. There are three possible situations: first, gold standard with no gold currency at all; secondly, gold standard with a limited gold currency; thirdly, gold standard and gold currency unlimited; that is, absolute convertibility between gold and silver, and silver and gold. You are now dealing with the third of those propositions?—Yes.

10,103. But have you finished upon the other point? I understand your argument would be, totally irrespective of amount, that the bulk of the currency of India would remain silver?—Yes.

10,104. I understand that your argument is that it is undesirable to have a gold standard, even if you could get a gold standard easily, because gold would not be the same metal as the preponderating currency of the country?—That is the very thing I am discussing, the case of a proper gold standard with convertibility, and allowing a gold currency to be used: I say that, even in that case, the amount of gold currency must in the nature of things be comparatively small, and I regret that those who have been putting forward the idea of having a gold currency have not supplied information as to the amount to which it could rise.

10,105. Then I suppose you will come back to a limited currency?—That I will come back to afterwards.

10,106. I understand you to say this, that, assuming a gold currency and a gold standard established, you object to that, because there has not been sufficient evidence given us to show what amount of gold would

be required for that purpose?—That is my point, and I think it is a very material one. In the absence of statements by those acquainted with India as to what the amount required would be, I should like to put this to the Committee. If we make the comparison with England, where we have just been discussing the amount of gold in circulation, and comparing the economic circumstances of India, taking out, for the purpose of comparison, the figures of income tax when there was an income tax, or the figures of assessed taxes now, if we compare that with the receipts from income tax in England, and other direct taxes, you would find this: if we can carry on with 60 millions of gold currency in the hands of the people, I doubt very much whether that would give you much more than 3 millions for the people of India. No doubt, gold could be used by certain classes in India, and in certain wholesale transactions, but I should like to have some information as to what the highest amount of that gold would be. As far as I can judge, it must necessarily be a small figure, and gold would not be familiar to the general mass of the population in India.

10,107. Are we to understand that you think that, supposing a gold standard were accompanied by an unlimited gold currency, the real amount of gold that would be required would be very small?—That is my opinion, for the currency.

10,108. You say there has been no evidence, but I think Lord Rothschild put it that, at the beginning, 20 millions of gold would be sufficient?—My own opinion is that 20 millions of gold would be sufficient both for currency and reserves in ordinary cases, and my doubt about the amount of gold that India would require for establishing a proper gold standard and gold currency arises from the existence of the hoards of rupees in India. You must make an offer, if you introduce the gold standard properly, to give gold in exchange for rupees; and the element of uncertainty is the hoards of rupees in existence, which might compel you to provide a much larger sum than the 15 or 20 millions, which apparently would be sufficient if you had only the actual circulation to deal with, and were not impeded and hindered by the existence of these hoards of rupees, which you might find it very difficult to deal with.

10,109. Then, that being so, what do you say to a limited currency?—Before we come to that, I should like to mention this point as to India being a poor and indebted country, which makes it difficult to maintain a gold standard. I mention the fact that many countries which tried to introduce a gold standard, or something like a gold standard, in my early days at the *Economist*, at the beginning of the seventies, have since lost the standard. I mention, among other countries, Brazil, the Argentine Republic, Uruguay, Chili, Portugal, and afterwards Italy.

10,110. Were not all those countries, countries where there was unlimited paper money?—I shall mention that presently. In addition to these, I have noticed Spain and Peru, which were hardly gold standard countries proper, but which certainly used a certain amount of gold. Almost all these countries have lost the gold standard subsequent to the date at which I was writing, although they had it at one time in a tolerably effective manner. How they lost it, of course, is a question for discussion and consideration, but that they had it at one time is certain, and that they did lose it is, I think, also the fact. I believe the great evil in all of them was the issuing of inconvertible paper, but the point will be whether the issuing of inconvertible paper was not itself caused by the difficulty that these people had in maintaining a gold standard. The difficulty was a very serious one, the moment you asked them to pay their debts. It was all very well in 1870, 1871, and 1872, when everything was booming, to have a gold standard; but in a few years afterwards, when you asked them to pay their debts, they did not pay, and it was then that the issue of inconvertible paper began. I am speaking quite generally, but that is how it occurs to me, going back to the history at that time. I think there is a real difficulty for countries like Chili and Brazil and some other countries that we have named, in their economic conditions, to maintain a gold standard, because the pressure upon them in times when money is stringent in London is really overwhelming and they can really hardly resist it. That was what was present to my mind as a difficulty which might arise in the case of India.

10,111. I suppose all those countries very much outran the constable. They all spent more than they got?—But still, you have a case of a country in a very similar economic condition to India, namely Mexico, which has been able to keep a silver standard. I doubt if Mexico would have been able to keep a gold standard.

10,112. (*Sir F. Mowatt.*) If these countries which, as you have mentioned, outran the constable, had had no gold and had had no silver, what difference would it have made to them which their standard was in? If they had spent more than they had got and had had to pay their debts, how would it have made any difference if they had had to pay their debts in silver or in gold?—There is greater demand for gold, and gold is the money which they owe to their creditor countries as a rule. The creditor countries are the gold countries, and there is a great squeeze for gold when these other countries are called upon to pay their debts. I may mention that about that time you had Turkey and Egypt, which have been mentioned in these discussions, also on a gold basis. Egypt, I should say, is undoubtedly a case of a country which is really much richer economically than some of those that have been mentioned, and it has had great advantages in regard to payment of its gold debt. I do remember the time very well indeed when Egypt was in a state of financial chaos, and would have had that difficulty which Sir Francis Mowatt has mentioned of retaining even a silver standard, but since then Egypt has improved, and with good financial management and with the wealth which it possesses, it has been able to maintain a gold standard. Turkey, I think, has not a proper standard of either gold or silver, and that is not a very good country to mention in connection with these discussions.

10,113. (*Chairman.*) However, your opinion is that India would have a difficulty in maintaining a gold standard, even if introduced in a proper manner, because it is a poor and indebted country?—Yes, that is my view.

10,114. Now, what is your next point?—The next point is as to the production of gold, and whether there will be gold enough. Upon that point I refer to the state of matters before 1848, and compare the increase of gold at that time with all the ideas that we then had as to what effect that increase would have with the state of things at this time.

10,115. What is the gold position in the world?—The gold position seems to me to be very well expressed by Lord Rothschild.

10,116. Lord Rothschild entertained no doubt as to there being plenty of gold?—His judgment as to there being plenty of gold, I doubt. As to the facts that he stated, I generally agree with him. You may put it in this way. The production of gold has greatly increased of late years, but not so much relatively to the previous annual production as the increase in the fifties was to the annual production before that. Down to about 1836, before the gold discoveries in Russia, the production of gold throughout the world had got almost to a vanishing point, being from about 2,000,000*l.* to 3,000,000*l.* sterling yearly. Before the Australian and Californian discoveries, about the year 1848, the production had got up to about 7,000,000*l.* to 8,000,000*l.*, but, a few years after that, the annual production had risen to from 30,000,000*l.* to 35,000,000*l.*, and remained somewhere near that figure for some time. The production was thus four or five-fold what it had been immediately before, and, if we make the comparison with the period before the Russian gold discoveries, it was ten or twelve times

Sir R. Giffen, K.C.B.

29 Nov. 1898.

what it had been. At the present time, the increase spoken of appears to be as from 30,000,000*l.* to between 50,000,000*l.* and 60,000,000*l.* annually, or about double. Or, if we go back to the period of lowest annual production since the Australian and Californian gold discoveries, viz., to about 1880, when the figure was little more than 20,000,000*l.*, we may say that the production is now about three times what it was at the outside. The proportion of increase is accordingly much less now than it was. We cannot assume then that gold will now be available for new fields as it was in the 'Fifties, or will have so much effect as it had then in raising prices and wages. At that time, very extravagant ideas were formed as to what effect the new gold discoveries would have. As a matter of fact, although Germany undoubtedly, and the United States probably, were influenced by the opinion as to the abundance of gold, they were enabled to obtain the gold which they required for their purposes by squeezing the rest of the world, and causing that loss of the gold standard which many other countries sustained. That is the broad view of the case. It seems to me now that there is great danger in assuming that, in consequence of the increase in the production of gold, you will have enough gold to go round everywhere. That is exactly the mistake which was made 30 years ago, and which the people who have charge of these matters—the Governments of the leading countries—ought to be careful not to make again. There may not be gold quite sufficient for all these purposes; but I am quite sure of this, that, if the abundance of gold continues, and causes a great accumulation of gold in the banks and a great rise of prices, which is quite a possibility again, it seems to me that the rise of prices, and the rise of wages consequent upon it, in the old countries, and the general prosperity, would lead to the consumption and absorption of a much larger amount of gold than I think Lord Rothschild appears to calculate upon. He assumes that the demands in this country and in the old countries would remain pretty much the same; and then he makes the calculation that so much surplus would be left for other people. What I believe ought to be reckoned is that the demands for the old countries themselves, in the case supposed, might be incalculable, and I believe that they will be very large, and that the difficulties of countries in a less favourable economical position in adopting a gold standard would still be very considerable indeed.

10,117. It is a question of opinion with you upon that point?—I do not think that Lord Rothschild mentioned any reasons to the contrary. He simply made a calculation that, assuming things remained as they are in the old countries, there would be so much for the new countries. What I am pointing out is that the demands for the old countries are themselves subject to modification to any extent, and that, just as it happened in the fifties and sixties, you would have a very large demand for the old countries such as you cannot now foresee, and then that the pressure on countries in a secondary position would be very extreme.

10,118. Then what have you to say with regard to the present methods suggested for inducing gold to go to India?—Speaking specially in reference to the proposal of the Indian Government itself which is before you, my objection rather is to the leading idea at the root of the suggestion, quite apart from any criticism which may be made in detail. This idea is that a given value of money or currency is required by a community with a certain range of prices, and that, if prices rise or fall, the currency is proportionately increased or diminished, and *vice versâ*. Further, that one form of money in value may be made to replace another exactly, so that, if you make a gap in the one, the other comes in. The unsoundness in this idea is that you may in fact have great changes in prices, with no change in the quantity of currency, and great changes in the quantity of currency without changes in prices. I would give, as instances, what happened in Russia during the fall of the rouble about 15 to 20 years ago, when there was much speculation in the rouble in Berlin. In spite of the great fluctuations in the value of the rouble which then occurred, it was observed that the quantity of the inconvertible paper, although changing greatly in the aggregate, was accompanied by the absence of change in the quantity of small notes circulating. I have here with me a table in which I have extracted figures from Mr. Kaufmann's *Statistique Financière de la Russie*, in 1886. Mr. Kaufmann, who is an official in the Russian Ministry of Finance, published this book many years ago, and when I met him in Paris in 1889 he called my attention specially to the point I have mentioned. I extract from this book a statement showing the issue of notes in Russia outstanding on January 1st of the following years, distinguishing notes issued temporarily, and showing amount of issues deducting temporary notes.

(In Millions of Roubles.)

Year.	Total issue.	Notes issued temporarily.	Total issue deducting Notes issued temporarily.
1860	687	—	687
1861	713	—	713
1862	713	—	713
1863	691	—	691
1864	636	—	636
1865	679	28	651
1866	678	27	651
1867	709	59	650
1868	715	34	681
1869	724	—	724
1870	732	10	722
1871	757	41	716
1872	773	49	724
1873	771	7	764
1874	797	5	792
1875	797	—	797
1876	797	—	797
1877	790	55	735
1878	1040	305	735
1879	1188	468	720
1880	1162	446	716
1881	1133	417	716
1882	1133	417	716
1883	1133	417	716
1884	1103	387	716
1885	1073	357	716

The point is that, in the years 1877, 1878, and 1879, when there was a great increase in the issue of roubles in Russia, the increase was not in the ordinary circulation of the rouble, but in special blocks of rouble notes of large denominations, which were the subject of speculation on the Berlin Stock Exchange. This table shows that the ordinary circulation stood at about 700,000,000—sometimes a little less, sometimes a little more—the whole of that time during which these immense changes in the total quantity were occurring through the issue of the rouble notes which were the subject of speculation in Berlin.

10,119. (*Sir F. Mowatt.*) Do I understand that that circulation is confined to the small notes?—So I understand, the active circulation.

10,120. Do you know the limit of the notes?—The limit of notes is about 50 roubles. The table does not show the particular size of rouble notes. The book was given to me by Mr. Kaufmann as bearing upon this particular point, but, I believe, the actual circulation of the rouble notes looked at in detail will quite confirm this. The other case I should like to give is that of the United States of America, where, for a good many years after 1868 or 1869, the circulation of greenbacks remained absolutely the same down to 1878, when specie payments were resumed, and yet you had the greatest fluctuation in prices and in the value of gold in relation to those greenbacks, and it was only slowly that they came up to a value with gold. Although the total amount of the greenback issue remained exactly the same all that time, you had a considerable change in prices. At this point I might refer the

Committee to a table about the price of gold which is contained in the first of these memorandums which I wrote in 1879, where you will see the exact figures. Then a more recent case is that of France, where the note circulation in recent years has enormously increased, without corresponding changes in prices, and without any increase of population. My conclusion on this point is that it is a wrong idea altogether that, if you make a gap in the currency of India, it will be filled up by gold or any other new form of money which you desire. It is impossible indeed to foresee what makeshifts will actually be employed by a community subject to this inconvenience. You cannot say that the particular substitute which you propose will be used. As to whether you can substitute one currency for another, I should refer to my evidence before the Herschell Committee, questions 2061 to 2082, where I gave my opinion upon this point. It arose incidentally before the Herschell Committee, and I there gave my opinion that one kind of currency cannot be exactly substituted for another.

10,121. (*Chairman.*) I do not quite understand how this is bearing upon the proposals of the Government of India?—You will find that they based their proposals on the idea that a currency which is just sufficient when the rupee is at 1*s.* 3*d.*, would be redundant at 1*s.* 4*d.*

10,122. You are now going into the question of redundancy?—Yes. It is the same question, and I give the case of the American money. You had American greenbacks at all sorts of prices with the same amount actually in circulation.

10,123. The greenback was, after all, another shape of the National Debt. It was really a Government obligation. I do not see how that bears on the proposals of the Government of India. What they want is to establish a gold standard on a certain basis, and their argument is, that, if there is a redundancy of currency, they ought to reduce the number of rupees in the first instance, and then to restrict the circulation in the way mentioned in their proposals. Your point is that there is no redundancy?—The theory that there is a redundancy of currency is based on the idea that, if you have a currency that is sufficient at 1*s.* 3*d.*, it must be redundant if the rupee is at 1*s.* 4*d.*, because you want so much less currency. Then I gave these cases of the greenback circulation of the United States, and the rouble circulation in Russia, and I show that, with all kinds of prices of greenbacks and roubles respectively, you have the same amount of circulation. There is no such thing as redundancy of currency at one price or the other.

10,124. You say there is no redundancy of currency in India?—I say it does not follow by merely showing that, if you have enough at 1*s.* 3*d.*, you must have too much when it is at 1*s.* 4*d.* That is a wrong idea altogether. In addition to the question of value, you have to consider the number of coins circulating, and the number of bits of paper circulating as well, and you cannot say that in one case the currency is redundant and in another case it is not. That is a wrong idea altogether.

10,125. Then you object to the argument of the Government of India upon that ground?—Yes. It may look an abstract question, but it really goes to the heart of their scheme.

10,126. Is not the question, how much the currency would have to be increased assuming that they are quite wrong? Now let us come to their real proposal?—I should like to add this observation: If gold, therefore, is rated to the monopoly coinage, which has now been established in India, at any point that may be fixed, the difficulties that will arise will apparently be of the same nature as those of a bi-metallic standard itself. There will be a double standard, although not exactly a bi-metallic standard, because one side of the standard will be a monopoly coinage at a value much greater than that of its metallic contents, and only on the other side will there be a metal. Still, the two will make a double or alternative standard, and it will be impossible to fix upon any rate between the two which will be maintained. It is quite conceivable, in my opinion, that the monopoly coinage might continue to increase in value, because it is required for special purposes, and that gold may not enter into the currency when the rate at which it is allowed to enter is exceeded, because the gold will in fact not be able to do the work which is done by the monopoly coinage. The instances of Germany, France, and the United States, where a small amount of legal tender silver coinage is used in proportion to the total currency, are not in point. In these cases, the legal tender silver coinage is not specially in demand for any purpose, is really superfluous, and is kept at its value by gold being more or less freely exchanged for it at the will of the Government. The case will be quite different in India under the conditions suggested, because the monoply coinage will be the main coinage, and will be indispensable for the performance of certain work which gold cannot perform.

10,127. Have you anything to say about Mr. Lindsay's scheme?—Nothing special, because it seems to me that all these different schemes are covered by my objections to a managed currency of any kind. My objection is more general than to specific details. No doubt these schemes, in fair weather times and for a certain time, might work, or appear to work, but I do not think they can be depended upon permanently, because essentially it will be having a managed currency, and that is not a thing, I believe, which will answer permanently and which ought to be recommended by any government.

10,128. Have you at all considered what the effect in India is of a depreciated currency?—I am inclined to think, but with some hesitation—because in the present circumstances any course which is taken seems to present great difficulties—but, on the whole, the least disadvantageous course to follow would now be to go back to silver in spite of all its deficiencies.

10,129. And risk depreciation?—Risk a great deal. There would be a great shock; it is not a thing that ought to be done lightly, and the fullest amount of time ought to be given to the consideration of it, but the important thing is this, that, to have a good money at all, you ought to have an automatic standard.

10,130. Is that all? To have a good money you must have an automatic standard, you say?—Yes.

10,131. Should you not have a metallic standard that fluctuates as little as possible?—I think any metallic standard you are likely to adopt is not likely to fluctuate in the sense in which we are using the word.

10,132. To-day we are faced with a metal which has fluctuated, and is fluctuating enormously, and we are face to face with the fact that the country where it prevails is a country 80 per cent. of whose trade is done with countries which do not recognise this metal and require another metal?—I should not accept the statement that it is silver which fluctuates enormously. I think that raises the very much debated question whether it is gold that fluctuates or silver that fluctuates enormously. I think, if you raise that question, speaking economically, there is quite as much to be said against gold as there is to be said against silver. My own impression is that silver did better for India in the last 25 years than gold would have done, and gold is better for England than silver would have been for England.

10,133. Is it your opinion, then, that the purchasing power of the rupee in India has not varied, and that the variation has taken place where it has been brought into contact, so to speak, with gold-using countries?—That would raise a great many questions which it would be very difficult for me to go into without specially preparing myself about prices and wages in India. I think myself, in India, where silver had not changed very much down to 1892 or 1893 with reference to commodities, at the chief ports in India at least, that silver on the whole was steadier than gold during all that time at the chief ports

Sir R. Giffen, K.C.B.

29 Nov. 1898.

in India; but it would require a great deal of consideration and study for me to say what had happened up country in India at different points and in different places. These things involve very difficult statistical considerations. What I am quite sure of is, that nothing has happened to silver which has not happened in former times to any standard money which you can possibly select for your standard. In the early sixties, I remember, you had a great change in your standard money in this sense. At that time gold and silver, I believe, were to a certain extent depreciated, and you had great changes in India in consequence of the depreciation of silver at that time. I do not think that of late years there has been depreciation of silver sufficient to make it unfit for standard money in a country which chooses to use it, and the case which I should put before the committee of a country which does use silver, and which has not come to grief in any way by using it, is the case of Mexico.

10,134. You say, "If it is impossible or undesirable "to go on to the proposed new metallic standard, then "the only two alternatives open are, either to return "to silver at the present rate of exchange and put "more silver into the rupee, or to go back to the old "standard itself, for which there are many reasons of "convenience." Do you attach any importance to putting more silver into the rupee?—I attach a great deal of importance to it. It seems to me that the putting of more silver into the rupee would cost a good deal of money to the Government.

10,135. Then you are against doing it?—I am against it, on the score of expense.

10,136. To call in the whole 120 crores of silver and reissue it would be very costly?—Certainly. I am not sure that in this country, which is a very rich country, having regard to the state which we have got into with reference to our token coinage, we might not call in our silver token coinage and replace it by a token coinage with the silver contents more nearly approaching the real value. At present we have not a token coinage quite in accordance with the principles of Lord Liverpool. But in India it would cost too much. There are also other objections with reference to contracts and things of that kind, which it would be difficult to discuss, which might make it undesirable to "thicken the rupee," as it is called.

10,137. Your opinion, I gather, on the whole is this: you think that the course which is the simplest and involves the least permanent loss, and is the most practicable, is to reverse what was done in 1893, to open the mints to the coinage of silver, and not to attempt either a gold standard or a gold currency, to leave the bullion value of silver to settle, so to speak, the exchange value of the rupee, and that the evils which would follow from any other course are greater than even the worst evils than could be predicted from that course?—That is the idea I have. Of course, that is my general impression. I am not at all responsible for the present state of things, and I feel sorry indeed that such a state of things as we now have should have arisen; but I think on the whole the least disadvantageous course is to face the difficulty, and to go back to the right path, which I think was gone away from in 1893.

10,138. (*Sir D. Barbour.*) You said you thought Mr. Bagehot was right in the opinion he gave in 1879, that silver was not likely to fall much more, but that it might rise?—At that time. Mr. Bagehot's opinion was given in 1876–7, and was only quoted by me in 1879.

10,139. I do not think you mean that the result justified his opinion, but that on the evidence as it existed at that time he came to a proper conclusion?—No, I meant to say that the result had rather justified his opinion; because, when you are making a statement of that kind, you are not looking to the whole future, you are only looking to the immediate future, and the steadiness during the next few years after he gave that opinion did justify it.

10,140. And therefore you say he was more justified in his opinion by the result than the Government of India were in theirs?—I have not the paper before me now, in which the Government of India gave their opinion, but I think he was fairly justified in his view that there would be steadiness.

10,141. The Government of India say this: "The "current of all the most trustworthy opinion tends "more and more towards the conclusion that, so far "as can now be foreseen, there is no prospect of an "early or complete recovery in the value of silver, "and, on the contrary, that the probabilities are all "in favour of a further fall." That was the opinion of the Government of India?—But how far that was supported in detail I cannot say at this moment, and everything would depend upon the particular details on which that opinion was founded.

10,142. I see your observation in reference to that statement was, "we must take leave to suggest that "the statement quoted is entirely without justifica-"tion"?—As far as I knew from current opinion at that time; but, of course, there is very little use discussing it without enumerating the opinions; and the Indian despatch does not mention the opinions to which they refer. I think I quoted Mr. Bagehot as certainly a man of some authority at that time; and he gave the reasons for his opinion, which I think have so far been justified.

10,143. But has not the course of events been pretty much what the Government of India ventured to predict it would be?—I do not think they "ventured to predict"; that was an opinion; and if, in consequence of something which they did not foresee at all, an event happened which they predicted, I do not think that that shows they were justified in their opinion.

10,144. Mr. Bagehot, as you say, came to what you think was a reasonable decision on the evidence as it then stood. If the Government of India came to an opposite decision, I suppose you would hold that they came to an incorrect decision, even though circumstances so altered that in the long run the Government of India happened to be right, and Mr. Bagehot happened to be wrong?—I do not think you can say that; because you can only give an opinion as to what is going to happen in the immediate future, and the Indian Government were wrong as to the immediate future—the six years immediately following their opinion.

10,145. The important question which the Government had to decide at that time was the question of the future standard of India—whether it should be gold or silver?—I do not think that was before them at all.

10,146. Was it not proposed to stop the coinage of silver?—That was more with reference to the immediate future.

10,147. Still, having once adopted the policy of a gold standard, they could not propose to go back to silver after six years?—No, and that shows the difficulty of raising a question of that kind, because they can only perceive a few years ahead, and you would not say that they were making the proposal with reference to the circumstances of 50 or 100 years hence, because the answer to that would have been that no one can possibly say what circumstances will be 50 or 100 years hence.

10,148. They say in their despatch, "We have con-"sidered it inexpedient to interfere at all with the "British Indian gold coinage, thinking it best to "restrict all changes in the law to what is essential "for accomplishing the first step towards the change "of the standard. We aim, it is true, at the eventual "adoption of the British standard, and the extension "to India of the use of British gold coins." Is it not clear from that, that they intended to alter the standard from silver to gold?—Undoubtedly that was the intention then.

10,149. In discussing a question of that sort, viz.:—the standard of value for a country, do you consider it reasonable to limit yourself to what may happen during six years?—I think it is quite impossible to go into questions of what may happen 50 or 100 years hence. The whole thing is a mistake, because

you cannot have the materials of judging except as to what is to happen within the next few years.

10,150. Then do you think, in making up your mind whether you shall or shall not change the standard, it is sufficient to confine yourself to what is going to happen in the next few years?—I think it is a thing you should not think about at all, unless there is immediate necessity for making the alteration; and almost all the proposals that have been made for changes in the standard of value have been more or less incorrect, if you take a long period afterwards. For instance, Ricardo, at the beginning of the century, was rather in favour of silver at first as the sole standard for England, but he changed his mind in the course of a few years, because he thought, from what was happening in South America and elsewhere, that silver was going to fall in value, and, as a matter of fact, we know that after 1816, and down to 1873, silver did not fall in value. I think it is hardly possible to take into view considerations such a long way ahead.

10,151. If that is the case, you ought never to change the standard of value?—I should think you should almost never change the standard of value.

10,152. Are you aware what the proposal of the Government of India in 1892 actually was?—I have not followed it myself very minutely; but I have read the proposals to some extent.

10,153. I thought you suggested that the proposals of the Government of India in 1893 were to finally adopt the ratio of 1*s.* 4*d.*?—No. I believe I mentioned that there was some idea of, perhaps, going to 1*s.* 6*d.*

10,154. Perhaps you will take it from me—I can read you the document if you like—that the proposal was this: The original proposal of the Government of India was to close the Indian mints to silver, not to declare any ratio at the time at all, but to promise that they would not in any case choose a ratio higher than 1*s.* 6*d.*, but might choose a lower ratio, and to wait and be guided by experience as to what ratio should ultimately be adopted. You know nothing to the contrary of that?—No, that is quite consistent with what I have read.

10,155. I dare say you are aware that the modification made by the Herschell Committee in that proposal was to substitute a provisional arrangement by which the exchange could not rise above 1*s.* 4*d.*, in order to prevent any sudden and excessive rise of exchange, which they apparently thought probable. Is it not the case that up to the present time the Government of India are at liberty to choose any ratio they think best?—That would be quite consistent with what they proposed originally: that is to say, the measure of 1893 was specifically a measure for stopping the coinage of silver, and not so much for fixing an exchange for gold as the measure of 1879: but substantially I think the arguments against the one measure apply to the other.

10,156. Then you said that the difficulties of establishing a gold standard would probably be much greater than the proposers of that measure had anticipated?—That is the general idea; that it is a very difficult thing to do.

10,157. Do you think that the Government of India did not recognise at the time that there might be great difficulties?—It is one thing to express an opinion recognising difficulties, and quite another thing to take action which does recognise them.

10,158. That may be; but, if the Government of India expressly said that there might be very great difficulties in doing what they proposed, it is not fair, is it, to say that they did not recognise the difficulties?—I do not think that they realised all the substantial difficulties. A man may say that he realised difficulties in doing a certain thing; but, if he does not realise the real difficulties, that is the same thing as saying that he did not realise them at all.

10,159. Now, you are doubtless aware that at the time the mints were closed I was in India, and was the member of Council in charge of the finances of India. I will read you a passage from the speech that I made when the bill was introduced for closing the mints, and of course I must be taken to have been the mouthpiece of the Government of India at that time; in fact, to compare great things with small, it was very much as if the Chancellor of the Exchequer in the House of Commons made an announcement of the policy of the Government here. I said, "It might "be that the gold standard may be made effective "from the first, though it will not be secure until "there is a considerable amount of gold in our "treasuries and banks. Or it may be that the making "of the gold standard effective, and the establishment "of it on a secure basis, will involve a long and "arduous struggle, and necessitate heavy sacrifices. "Time alone can show which view is correct." Looking to that statement, I hope you will be prepared to do the Government of India the justice of saying that, at any rate, they realised that they had what might prove to be a very difficult task before them?—I do not think they fully realised that it might be an impossible task.

10,160. But still they did realise that it might be a very difficult task?—That it might take a considerable time.

10,161. And might involve heavy sacrifices?—But I do not think that that has always appeared in all the discussions on the subject. If I might make a suggestion to you, Sir David Barbour, it would be that you do not mention what kind of sacrifices were looked forward to at that time.

10,162. It might be that the Government of India, as I believe was the case, thought that there might be sacrifices the exact nature of which it was not possible to foresee at that time. At any rate I can say that that was present to my own mind?—I do not think that that view of the subject was present to many people who considered the matter even in 1893.

10,163. But perhaps you would accept my statement that it was present to me individually?—I accept your statement undoubtedly, that in your view the thing might be very difficult to do.

10,164. And I do not think I ever said absolutely that it was possible to establish a gold standard?—I do not think it was present to most people's minds, who had to deal with the subject in this country, that it was such a long and difficult operation. Of course that depends upon the people with whom one may happen to have conversed, but I do not think it was ever represented that it was an operation, for instance, which might go on for 20 years before you could establish a gold standard.

10,165. I should like to read you another passage from a statement of the policy of the Government of India. This is a deliberate statement of the policy of the Government of India; in making it, I was merely the mouthpiece of the Government; it was made by me in answer to a question put in the Legislative Council:— "The avowed object of the Government of India in "closing the Indian mints to the free coinage of silver "was to alter the Indian monetary standard from "silver to gold: but it was expressly stated in this "Council, on the 26th of June last, that it was not "intended for the present to do more than stop the free "coinage of silver, and, as a provisional arrangement, "to provide for the issue of rupees at the mints in "exchange for gold at the rate of 16*d.* per rupee. "The object of providing for the issue of rupees in "exchange for gold at 16*d.* the rupee, was to prevent "any great and sudden rise of exchange, and the "Government did not undertake either to establish "16*d.* per rupee as the permanent ratio of exchange "between gold and the rupee, or to establish any other "permanent ratio immediately, or within any specified "time." That would show that the Government thought that it might take a considerable time to establish a gold standard?—But not 20 years. There is no indication, so far as I can judge, in anything that I have seen as to what length of time the operation would take; and I think, as Sir David Barbour has quoted so much about his own point of view, and the point of view of the Indian Government at that time,

Sir R. Giffen, K.C.B.

29 Nov. 1898.

I may say that, as far as I can judge from the people on this side who were concerned in the matter, there was very little idea of going over to a gold standard at all. I speak especially with reference to the opinions of Mr. Bertram Currie, who was quite satisfied with having stopped the coinage of silver at the Indian mints.

10,166. I was only anxious that it should not be thought that the Government of India entered on this measure hastily, or that they thought or expressed the opinion that a gold standard could be established in India in a short time?—There is no doubt of course about the *bona fides* or the good intentions of the Government of India, and of all the people who were officially promoting it at that time, but that does not affect the question as to whether they adequately recognised the difficulties they were going to encounter; and it seems to me that, unless you look forward to providing a sufficient reserve of gold at once, and up to this moment no sufficient reserve of gold has been provided, you were not realising adequately the difficulties which lay before you.

10,167. Now you said that you thought there was too great a hurry in India to meet indebtedness when it arose, and that the Government might wait until the growth of revenue filled up the deficit. Do you not think it is a very dangerous thing for any poor country like India to accept a deficit for one moment longer than it is absolutely necessary to do so?—I quite agree. It is merely a question of what the time ought to be when the emergency arises. It is a mere question of degree. I am quite sensible that that is a very vital question indeed.

10,168. I daresay you recognise that the strongest answer a Chancellor of the Exchequer can make to his colleagues, when he is pressed to increase expenditure, is to say, "If you do not incur that expenditure you "will have a surplus, and if you do incur it you "will have a deficit"?—Quite so, but what I recognise is that there are many countries which are in an inferior economic condition to England that cannot do that. In this country we have numerous taxes—for instance the income tax, which we can shift up and down at will; but there are many countries where they cannot do that, so that it might be in those cases very injudicious to impose new taxes when perhaps by waiting a little they could get into better circumstances.

10,169. I do not know whether you are aware that the Government of India has on more than one occasion accepted a deficit—has budgeted for a deficit. That was the case in 1893-94?—I can quite understand that that should be so; there may be sometimes willingness to face a small deficit.

10,170. You say the Government of India should have waited. I daresay you will recollect that there were financial difficulties in 1874, when the exchange first began to fall in Lord Northbrook's time?—I do not recollect precisely those difficulties. I recollect the difficulties when Sir Richard Temple was Minister of Finance, and the difficulties afterwards in the time of Sir John Strachey, I think; but I cannot give you the exact dates.

10,171. When exchange fell, of course, you would expect a difficulty, and a difficulty of that nature arose in 1874. So that the Government of India had to meet a fall of exchange, and did meet it at that time without altering the standard. Then, I daresay you recollect that there was a subsequent difficulty when those proposals to which reference has been made came home in 1878. A difficulty arose at that time from the fall of exchange, and led to these proposals regarding which you wrote your memorandum?—All the same, for 20 years before 1892 there was practically no deficit in India.

10,172. There was a difficulty—it might be great or little—but there was a difficulty in 1877-78, which led to those proposals coming home in 1878?—I am quite agreed in substance with what you are putting.

10,173. (*Chairman.*) In 1864 the Indian Government sent home a series of resolutions as to a gold currency, and Sir Charles Trevelyan proposed a gold currency for India by declaring sovereigns and half-sovereigns to be legal tender at the rate of 10 rupees to the sovereign. That was strongly supported by the Bengal Chamber of Commerce, who sent home a resolution declaring their opinion that a gold standard was almost universally admitted to be a positive benefit to India. Sir Charles Wood eventually disapproved that proposal, but he gave a sort of compromise, namely, that a rate should be fixed. Then, in 1865, the Directors of the Bank of Bengal stated that the time had come when sovereigns and half-sovereigns should be declared legal tender. In 1866 the Government of India appointed a Commission to enquire into the operation of the paper currency. That Commission took a very wide range of evidence; and they reported that the evidence they had taken unanimously proved a demand for a gold currency, and that gold coins would be more popular than notes; and they objected to the note currency on the ground of the popularity of gold. Their general report was that the currency of India should be gold, silver, and paper. Then we come to the year 1878, about which Sir David Barbour has been questioning you, and upon which you wrote your two memoranda. Then in 1892-93 Sir David Barbour takes the thing up again. So that there has been nothing rash or hurried about the action of the Government of India; but this question concerning a gold currency and a gold standard has been under discussion in India for between 30 and 40 years, and it has always been, so far as I can find any evidence, a popular opinion among the banking and mercantile and general circles of India?—I can say that I am very well acquainted indeed with the correspondence and the papers about 1864-65, and some of the papers that were published in the Blue Book at that time are amongst the most useful that I can remember with reference to the discussion of the bi-metallic question. But, all the same, I do think that the proposals for a gold standard in 1864-65 were of a different nature essentially, being produced in different circumstances, from the proposals in 1892-93. In 1864-65 gold was supposed to be, and no doubt was, comparatively abundant throughout the world, and India in particular had been the recipient for a good many years of very large quantities of gold. It was quite a legitimate thing for people at that time to think more of the gold standard than would have been possible or desirable afterwards, when the circumstances had changed a good deal. But it does not follow, from the general opinion amongst the people engaged in the foreign trade of India, they being in favour of a gold standard for India, that that was conclusive of the matter; and it would not alter the fact that, even if you were to introduce a gold standard and gold currency now, the gold currency would be used as a matter of fact to a very small extent in the transactions of the people of India. But, as far as regards the point that the thing has been a great deal considered between the Government and the people of India at different times, that I should not dispute, because that is really a matter of history in which I should quite agree with you.

10,174. (*Sir D. Barbour.*) You may take it from me that there were difficulties in 1874—there naturally would be—when the exchange fell, and there were difficulties later on which led to the proposals of 1878, and you are aware that there were further difficulties about 1884 and 1885 which led to the Gold and Silver Commission of 1886. Then, after that, there was a sudden rise in exchange owing to the speculation caused by the increase of the American purchases. I think you drew attention at that time to the fact that the rise would be only temporary. Then, you will recollect that there were further difficulties arising from the same cause in 1892, and there was a great fear that the Americans would cease to purchase silver. Do you not think that, if the Americans had gone on purchasing silver, they would have gone to a silver standard?—That is an important question, because, I think, there has always been a danger of the Americans going in for

a silver standard. But, when you point out that the Indian Government went into the matter in 1874 and 1878, and again in 1885 and 1892, you are talking of different times altogether, when silver was about to have a severe fall. Indeed, it shows that, on the whole, their policy in taking the matter up was not quite justified, because they did not succeed in 1874; they did not succeed in 1878–79; they did not succeed in 1885; and no particular harm has happened to India. It might have been the case that, if they had failed in 1892–93, we should all be recognising at this date that the Indian Government might as well have left the subject alone, and that no particular harm was going to happen to India.

10,175. Or, on the other hand, it is just possible that we might have been preparing at this moment to meet another fall?—No doubt. One cannot tell what the future is going to be. We might have a fall in gold in the same way, as many people suppose is going to be the case; but no one would propose to alter the gold standard of this country because of that.

10,176. The fact that the Government of India had difficulties to meet in 1874, and again in 1877, and again in 1885 and 1892, and that there were apprehensions of further difficulties in the future, would show that the process of waiting which you recommend might have proved to be a very long one?—It does not show that any of the difficulties were of a kind even to suggest an alteration of the money of the country. That is where the great difference arises.

10,177. I merely say that it shows that the process of waiting might have proved a very long one?—But every Government must deal with all the circumstances affecting its finances; there are good times and there are bad times, and bad times do not even suggest to me the expediency of altering the money. Every alteration of the currency ought to be treated as a matter requiring the greatest care. That is the difference between Sir David Barbour and myself.

10,178. If the Government had, for instance, an inconvertible paper currency, would you recommend that they should change it or adhere to it?—Inconvertible paper, of course, has great difficulties and evils of its own, which ought to cause everyone to discourage it, and it is not a proper thing to have. It is not a good money.

10,179. Do you think the Germans were justified in changing from silver to gold?—It was a matter of which the Germans were the exclusive judges, they had very good advice about it. I think on the whole they might have done as well to keep to silver; but they had an undoubted necessity for making some change in their money, because they had such a great variety of currencies, not exclusively silver—a certain amount of gold was legal tender money in Germany before 1872—so that they had great excuse for changing their standard.

10,180. The pressure on them to change their standard from silver to gold was not nearly so great as the pressure has been upon the Indian Government?—There was no pressure on the German Government except one of convenience. The step was not taken in consequence of pressure, it was taken because they thought that, on the whole, gold would be better than silver; they had to make a change of some kind; they had to unify their money, part being gold and part silver.

10,181. Practically it was all silver?—No, they had a considerable part of it in gold and they unified it on a gold basis, but it was not done from any pressure, it was simply done because it was found absolutely necessary to make a change of some kind.

10,182. If they were justified in making the change by the prospect of the comparatively moderate difficulties they had to meet, *à fortiori* the Indian Government are justified in proposing this change now?—No. I think the Germans changed from a cause belonging to the nature of the money. The Indian Government proposes to change from a cause which should not have to do with currency or money at all. I think you took a false view of what it was expedient to do, when silver money changed in value in reference to other money.

10,183. You said that you thought India was unfairly charged with Imperial expenditure by England?—That was the opinion which I expressed.

10,184. I dare say you are aware that the Government of India would be glad to get the Imperial Government to bear a portion of that expenditure with which India is now charged?—I have no doubt that that raises questions of very high policy indeed.

10,185. I dare say you are aware—at any rate you may take it from me that it is so—that the Government of India has at times urged that matter on the attention of the Imperial Government?—I believe that has been the case.

10,186. And a Commission has been appointed to enquire into the matter, which is sitting now?—I have referred to that in my evidence.

10,187. You say you think the Imperial Government should bear a portion of the cost of the British Army in India?—That is the idea I suggest.

10,188. Then would it not be possible to argue that the Government of India should bear a portion of the cost of the British Navy, which protects Indian trade all over the world and prevents any naval expedition by foreign Powers against the coasts of India?—I duly took that into consideration, but on balance I thought the advantage ought to be given to India.

10,189. At any rate it is a matter to be settled after consideration by the persons interested?—No doubt. All I wished to express before this Committee was that, in statements by responsible officials in India as to the finances, they should not have confined themselves so exclusively to the question of their having reached the limits of taxation.

10,190. In point of fact, whatever view we may take as to the just proportions in which India and England should share that expenditure, the Government of India could only deal with matters as they stood?—That is so, no doubt, but to a certain extent we must recognise that the Government of India is the Secretary of State for India and the House of Commons.

10,191. But the Secretary of State for India at that time had not got any promise from the Imperial Government or the Chancellor of the Exchequer to give him three or four millions sterling a year, and he had to deal with the question on the basis on which it then stood?—I hope that one of the results of this Committee, and of the whole question of the money of India being raised, will be to compel our leading public men to consider the farther question of the relations between India and this country with regard to expenditure.

10,192. Then you said you thought that, if there was a gap made in the rupee currency of India, it might not be filled up by gold. I do not know whether you accept to any extent the quantitative theory of money?—The quantitative theory of money is explained so differently by different people. My own expressions about it have been interpreted in a very strange way. Ultimately, I have no doubt that the amount of the standard substance, the quantity offering in the market, and the quantity being supplied, have a material effect in regulating its value in exchange with other commodities. But that is not an opinion which can be taken to mean that a given quantity of money must be in existence in reference to a particular state of prices in a given country.

10,193. I merely asked you whether you accepted the quantitative theory of money to any extent, and you say you do to some extent—you do with certain limitations?—To the extent I have explained.

10,194. Then, if it were the case that the quantity of rupees in India was steadily reduced year by year, would not the value of the rupees rise?—It might rise to a point, but you do not know, when you are introducing an artificial measure of that kind, what else might happen, and what substitutes may come in.

Sir R. Giffen, K.C.B.

29 Nov. 1898.

10,195. I quite see that there might be difficulties, but, if the quantity of rupees in India is steadily reduced, the value of the rupee will tend to rise?—If nothing else happens; but that is the whole point, that you cannot do a thing of that kind without something else happening.

10,196. Still the tendency is for the rupee to rise, other things being equal?—Yes.

10,197. Then, if the rupee rose to gold point, that is over 1*s.* 4⅛*d.* under present conditions., would not gold come into India?—But it might be that it would not rise over 1*s.* 4*d.*

10,198. But, if you carry on the process of reduction to a sufficient extent, would not the value of the rupee tend to rise?—I think substitutes would have to be introduced to perform the work which the silver currency now performs. Whether gold would be the substitute is another matter.

10,199. But I cannot think of any substitute, except coins that are made legal tender?—We know that gold itself is used in many countries where it is not legal tender, and the same thing might happen in India; they might have other things in use; they might have silver bullion for example.

10,200. But how would you pay your debts in silver bullion?—Just as you do in China.

10,201. It is the law there, is it not, and silver is accepted by the Government?—No, I think not, it is simply the custom of people there to buy and sell in silver bullion.

10,202. Suppose a man accepted silver bullion in India, how could he pay his debts or taxes with it? The Government would not take silver bullion from him?—I do not wish to be judged by particular cases, but I do affirm that, when you stop the coinage of a particular country, and say that people are not to have money of a particular kind, you do not know what effects will be produced, and what substitutes will be made use of. Suppose you were to stop the coinage of copper in this country at this moment, and to say that no more copper coins should be issued, you could not say that gold would replace copper to any extent in the particular work which the copper performs; neither could silver; and I say that in India, supposing you stopped the silver, you do not know beforehand whether the gold to any material extent could perform the work which silver is now doing. That is a thing which you have to show in detail, and you must not assume it. You must show in detail what transactions gold would be useful for, how much gold would be used, and so on, but you cannot assume beforehand that gold is able to do the work of silver. Take the case of paper money. You cannot assume that gold alone would do all the work that paper money now does in this country, and still less that it could do the work which is now done by cheques. You have always to consider the particular currency, and what it can do.

10,203. But is there any intention expressed by the Government of India of limiting the quantity of rupees in India, if found necessary for the purposes of currency, any more than the Government of England limits the quantity of shillings below the amount found to be necessary in this country?—I have certainly seen expressions of that kind, but, if there is no intention of that kind, that brings you to the second point, that, unless you limit the rupees, if you provide for the expansion and contraction of the rupees just as shillings expand here in good times and contract in bad times, then you may have this difficulty before you; that you issue in good times more rupees than will circulate in bad times, and in bad times your rupee coinage goes to a discount. You are committed to the limitation of it, or you are committed to the abandonment of your gold standard.

10,204. But, if the arrangement was, as there is no doubt it would be, that no silver rupees would be issued in good times, unless gold were given for them, you would have that gold in hand to meet bad times when they arose?—That is to say, you would have the double reserve of which I have spoken, the gold as well as the silver reserve.

10,205. I merely wish to point out that with that reserve you could provide the means of increasing or decreasing the number of silver rupees according to the actual wants of the country. If you argue that that involves a gold reserve, which is a source of expense, that is another matter?—That brings you to the difficulty of the hoarded rupees. If you have to give gold for the rupees which you have issued in the manner you have described, you must make the offer of gold for rupees quite general, and then all the hoarded rupees may come out in exchange for gold. I do not see how you can make a distinction between the rupees which you issue in good times and the old rupees which are known to be in existence.

10,206. Nor do I make the distinction. The only limitation on the exchange of gold for rupees would be the amount of gold you have actually received beforehand?—If you limit it to that, and that gold should be exhausted, away goes your gold standard.

10,207. To that I agree. You also say that the hoarded rupees coming out might break down the gold standard. Again I agree, but that all depends on whether the rupees do come out of hoards?—No doubt.

10,208. If it should prove that the rupees that are in hoards are not brought out in exchange for gold, that would make the thing somewhat easier?—Of course, if the Indian Government is prepared to offer gold for rupees, a great many of my objections to their proposals fall to the ground. But I understand from Lord Northbrook's evidence, and from the expressions of the Indian Government itself, that that is the one thing which they are determined not to do.

10,209. They are determined not to be bound by law to offer gold for rupees to an unlimited extent?—But it must be unlimited, or it would not be effective.

10,210. Would you not rather say it might not be effective?—It might not be effective.

10,211. And the rupees that are in hoards may not be presented, and, if so, that difficulty would not arise?—We must go by the light of human nature a good deal in this matter, and I should think probably they would be presented, especially if there was an opportunity of replacing them immediately after by rupees at a lower rate. Still, a great many of my objections to the Indian Government proposals would fall away if that were so.

10,212. (*Chairman.*) We are dealing with the whole question. We might recommend, as you say, that rupees should be convertible: that is an open question. Your opinion, I take it, is that they ought to be made convertible, and that, if they were made convertible, that would do away with many of your objections to the Government's proposals?—I have no hesitation in saying so.

10,213. What I mean is, this Committee is not bound by what the Government of India have proposed?—I have no objection to say that a great many of my objections would disappear if that were so. Of course, another chief objection remains, which would be the expense. The objection would remain that on the whole, I think, silver would be the better standard still; but, if you make the rupee quite convertible, and if you are prepared to face the expense, and if that should prove to be a kind of monetary arrangement which the people of India would willingly accept, then I have no objection to a gold standard for India in that way.

10,214. (*Mr. Hambro.*) As long as it is a real standard?—As long as it is a real standard.

10,215. (*Sir D. Barbour.*) Assuming that it was decided to introduce a gold standard, or to attempt it, would you recommend that the Government of India should undertake to give gold for rupees to an unlimited extent?—I do not think it can be done properly without that.

10,216. But do you think it would be a safe thing to do?—I do not think it would be a safe thing, on account of the evidence as to the magnitude of the hoards.

10,217. And, if the Government of India did it to a limited extent only, it might succeed, or it might not?—Quite so. It is more or less an uncertainty.

10,218. I dare say you will admit that the Government of India recognise that, if the money now in hoards were presented in exchange for gold, it would create a serious difficulty?—They seem to lay it down very much that it is not a thing to be thought of—to offer gold for rupees.

10,219. But they recognise that people who have silver rupees in hoards might come forward and take gold instead of them, and get the rupees into circulation, and in that way possibly a serious difficulty might be involved?—That is so.

10,220. On the other hand, if the people who have hoards did not do so, that difficulty would not arise?—No.

10,221. And still more, if people went on hoarding rupees as they did before, there would come into play a force which would facilitate the establishment of a gold standard?—I am not quite sure of that. That might create this difficulty: that the Government of India would not know at any moment but that the people who hold the rupees might come forward. *Sir R. Giffen, K.C.B.* 29 Nov. 1898.

10,222. But for the time being, at any rate, it would make the establishment of the gold standard an easier matter?—That would be so.

10,223. Then a great deal depends on what the action of the people who are the hoarders of the rupees may prove to be?—Yes. You mean with regard to people selling rupees, demanding gold for their rupees.

10,224. Or continuing to increase their hoards of rupees?—That would be so.

10,225. And we must, I suppose, wait to see what happens and be guided by experience?—That is just one of the difficulties of the matter. I do not think you should leave the money of a great country like India quite at large.

10,226. Unless you cannot help it?—Necessity has no law, of course.

The witness withdrew.

Adjourned.

Sir ROBERT GIFFEN, K.C.B., recalled and further examined. *Sir R. Giffen, K.C.B.* 10 Jan. 1899.

10,227. (*Chairman.*) Have you anything you wish to add to your previous evidence?—I should like to add one or two words to make quite clear the answer to the Question 10,204 and 10,205.

10,228. Question 10,204 is: "But, if the arrangement was, as there is no doubt it would be, that "no silver rupees would be issued in good times, "unless gold were given for them, you would have "that gold in hand to meet bad times when they "arose." Your answer was: "That is to say, you "would have the double reserve of which I have "spoken, the gold as well as the silver reserve"?—I should like to add something almost by way of a question; it comes to that, because the question reads as if you would always have gold to be given out for the rupees that were brought back to you, and that would apply to the rupees given out now. When people bring gold to the Currency Department in India, I understand that you have rupees in the Currency Department to give out. But suppose after a time you have no more silver in the Currency Department than what you think it necessary to keep as a reserve, it is quite clear that you would then have to apply the gold to the purchase of silver with which to coin rupees. Then, if these rupees came back, you would not have that gold, or, at least, you would have only a part of it, with which to take these rupees back in bad times when they were more or less redundant. I do not know that the point is very material, but it seems to me that the question may arise in course of time.

10,229. Is there any other point on which you wish to add anything?—The other point was with reference to the remark you made about silver being so fluctuating a metal. Without going into a discussion of the matter—I do not wish to go into any controversy upon it—I should just like to state what my own view on that subject is. Since the beginning of this divergence between gold and silver, I do not think the depreciation has been all through of the same character. I think in the first part of it, about 1876 or 1877 or thereabouts, about the time when Mr. Bagehot was writing, you had the beginning of what was a depreciation of silver in the sense in which Mr. Jevons and the older economists had written about the depreciation of money. But that did not last very long, and, for a good while after that, the position rather was, not that silver had depreciated in the old sense—I am speaking specially from the point of view of India—but that the gold in which a part of the obligations of India were payable had appreciated in the old economic sense. Since 1892, however, I should be inclined to say that, if the Indian Government had maintained silver as its standard, you would have had a depreciation since that time in the old sense, as economists understood the word; that is to say, measured by the leading wholesale commodities, which was the kind of measure which the old economists used to take. I wish to state that as my view of the depreciation of silver, so that there should not be any confusion when questions are put to me.

10,230. Is that entirely irrespective of the excessive production of silver?—That would be so. The excessive production of silver produced no depreciation, in the old sense of the term in which we economists used to speak of money, until 1892, with the exception of that brief interval in 1876 or 1877.

10,231. But was not the ratio between silver and gold practically a fixed ratio?—That is quite true. There had been a fixed ratio, but in the economic sense you had a depreciation of both gold and silver in 1848 and 1862. That was the theme of Mr. Jevons' famous essay. That depreciation was both in gold and silver, in the old sense in which these words were used.

10,232. You think that the depreciation practically has nothing to do with the fall in the price of silver?—The fall was with reference to gold; and, of course, if you simply measure gold and silver by each other, it leaves open the question as to which the movement is in. That is a controversial matter. The points I have been mentioning just now, are, I think, a little away from controversy. I am trying to explain what is the exact view I have of the course of events since about 1872.

10,233. (*Sir F. Mowatt.*) How long after 1876 did the depreciation of silver (in what I may call the legitimate definition of "depreciation") go on?—It was a very short time. Mr. Bagehot at that time said that the depreciation, which he considered—and I think rightly at that time—to be mainly due to the sales of silver by Germany and the cessation in the coinage of silver in France, did produce a very considerable flow of silver from this side to India. And, I think, at that time it was just the beginning, not very well marked, of an actual depreciation of silver in the old sense.

10,234. How long do you say that lasted?—Not very long; for a very short time.

10,235. For years?—Two or three years merely. What came about after that—and what was really underlying it for the whole time—was the appreciation of gold, as we should call it, and there was nothing in India to justify you in speaking of the depreciation of silver, in the old sense, with reference to commodities.

Sir R. Giffen, K.C.B.

10 Jan. 1899.

10,236. (*Sir D. Barbour.*) There was one explanation that you gave, which, I think, refers to a question of mine; that is, as regards the case where the gold was presented for rupees, and the Government had to purchase silver before it could give out rupees in exchange. That, of course, absorbs a portion of the gold handed in; but, if the rupees are afterwards brought forward and gold demanded, the silver in those rupees would be available to replace a portion of the gold with which that silver had been originally purchased?—I was rather putting a question than giving an explanation.

10,237. That would be the case, would it not?—That would undoubtedly be the case, unless you had in view that the silver would have to go out again, and then you would not put yourself to the trouble of selling it.

10,238. (*Mr. Campbell.*) You state, as one objection to a gold standard for India, that India is a poor and indebted country?—That is the statement; and it seems to me that there can be no question of the poverty of the people as a whole, compared, at any rate, with the people of a country like the United Kingdom; and, equally, there can be no question of the indebtedness of the country as a whole to other countries.

10,239. But, as regards debt, India is able to discharge her foreign obligations by means of the surplus produce exported?—That would be so.

10,240. And besides doing so, she is able to command a large amount every year of the precious metals?—That is also quite true.

10,241. For the last 11 years the average import into India of gold has been 12 crores?—I should thank you not to speak to me in crores, because I do not quite follow it.

10,242. Rx. 12,000,000?—There is no doubt that India for many years has been what has been called a sink of the precious metals, and quite as much in the past few years as in any previous time.

10,243. Then, in view of this large command of the precious metals over and above paying her indebtedness, can you say that India is a country that can be justly described as poor?—I think so. If you look at the general condition of the inhabitants of India, who are hardly able to bear any taxation whatever, I think you must describe them as a poor people, taking them all round.

10,244. I am not speaking of individuals, but of the country as a whole. Would you not say that a country which can pay its way and command such an immense amount of the precious metals is a country of large resources?—I have no doubt there are large resources in India, and that, if you come to the question of the distribution of wealth, you may find very considerable classes in India who are well off. The result of that would be that there are two Indias. But, as to the fact of poverty generally, that is surely a thing about which there can be no sort of doubt; and surely the fact that India owes very large sums to foreign countries is also quite clear. Hitherto India has paid its obligations, not altogether without borrowing. There has been a certain amount of borrowing for a good many years, but that does not alter the fact that it has had to pay debts.

10,245. Has the borrowing been so much for the purpose of escaping the payment of debt as for the purpose of productive public works?—Whatever the origin of the borrowing may be, it facilitates the operations of India altogether. It is a kind of resource to the people in India while the borrowing lasts.

10,246. But it is naturally a very different thing to borrow in order to escape payment of your debt, and to borrow for the purpose of investing in a remunerative undertaking?—But the immediate effect is, to a certain extent, the same.

10,247. When the mints were open to silver, India acquired through her trade balance the silver necessary to maintain her currency?—No doubt India acquired a large amount of silver. I do not think very much was required to maintain the active currency.

10,248. Is there any reason why she should not, in the same way, be able to command the necessary gold, if gold were to be her currency in future?—I think there would be much greater difficulty in commanding the gold, because gold is so much sought after in comparison with silver by other countries.

10,249. If a gold standard and currency could be established on a sound basis, would it not have the advantage of giving stability of exchange with those gold standard countries with which the great bulk of India's foreign trade is conducted?—There is no doubt that, if you could establish a gold standard in a proper way, India would come to be in much the same position, as far as the foreign trade is concerned, as is Australasia, and I do think that that would be advantageous to a certain extent. The whole question is one of a balance of advantages and disadvantages.

10,250. Then, as regards the Government's position, the Government would also, under a gold currency, be freed from the uncertainty now attending every Budget, as to whether the fluctuations of exchange might not upset its estimates and convert a surplus into a deficit?—I think the Government might manage, in the way I explained in the second memorandum which was before the Committee, to deal with these fluctuations.

10,251. (*Sir F. Mowatt.*) Fluctuations of exchange or fluctuations of expenditure?—Fluctuations of exchange owing to its having a gold debt.

10,252. (*Mr. Campbell.*) These fluctuations of exchange depend on trade, not on the action of the Government, do they not?—But suppose the Indian Government had all its obligations expressed in silver, the question of exchange would not affect it. India is subject to the same difficulty in exchange as is every country which has a gold debt and has not got the same money as the money in which the debt is payable; but that is a difficulty which is not to be spoken of as altogether incalculable, because it is a kind of difficulty which many countries have had to deal with from time immemorial, and which many countries have to deal with as well as India at the present moment. It was a difficulty of Russia, for instance, for many years; it was a difficulty of Austria-Hungary. It is a difficulty now with Mexico; it is a difficulty with South American countries; but all of those countries may get on very well and be prosperous, although they have that difficulty of exchange, and there is no insuperable obstacle in them to a government having good finance.

10,253. But might not good finance be more difficult on that account?—Then it is a question of degree. It may be desirable to have a fixed exchange, but it is a question of degree whether that is a sufficient reason for altering the money.

10,254. You would say, would you not, that those are difficulties which ought to be considered in deliberating whether India should have a gold standard or not?—Yes, and my own opinion is that any difficulties that arise from exchange are not big enough to justify a government in altering the money of a country, providing the money is quite satisfactory in other ways, as I think silver was in India before 1892.

10,255. With a gold standard and a gold currency, India could settle her foreign obligations (if produce were not available) by a shipment of gold, in the same way as the foreign obligations between this country and America, for instance, are settled?—It could always be done even now. Without a gold standard in India itself, it could always settle its gold obligations by taking part of that gold which is in India, though it may be difficult to get at it.

10,256. India might not part with it except at a prohibitive price?—I mean, there is no difficulty in settling your gold obligations if you have your resources in some form or other, and India, if it has got the resources, may purchase gold in some way, if

it was not willing to part with any of the gold in its possession. If India had a gold currency, and were to ship gold in payment of its gold debt, then, of course, that would give rise to the very difficulty which I have pointed out in my evidence, that the gold standard itself might be endangered if the gold were taken out of the currency.

10,257. If too much were required?—If it were taken out of the currency.

10,258. But with a silver standard there are two alternatives before the Government as regards settling foreign obligations, either to submit to the drop in exchange necessary to command the required exports, or there is the temptation to meet it by borrowing?—Would not that difficulty always arise, as far as borrowing is concerned, that that is an easy way of paying your debts? But I think, on the whole, that, as you must submit to some loss on your produce in selling it to meet your gold debt, it is more advantageous to a country like India to meet it by a fall in the value of its own money, with reference to foreign money, than by an open fall of prices which would otherwise have to be submitted to.

10,259. Then, in addition to the considerations we were just alluding to, there are the financial difficulties, which have already been discussed with you at some length, which also require to be taken into consideration in deliberating on the question of a gold or silver currency?—As I have understood the matter all along, these financial difficulties were the chief reasons for the Indian Government proposing to alter the money; it was mainly the difficulties of the Government.

10,260. You think that was what influenced the Government more than the other considerations which I have alluded to just now?—Of course, this Committee will have its own opinion on these matters, but that is the impression that has been conveyed to me in all the discussions—that the difficulty of the Indian Government in adjusting its Budget was the serious matter.

10,261. (*Sir. F. Mowatt.*) Did you say a serious matter, or the serious matter?—The serious matter.

10,262. (*Mr. Campbell.*) Assuming that a gold standard and currency for India should be resolved upon, you have seen the various recommendations as to the best may of introducing it—the Government scheme, and the Lindsay scheme, and others?—I have given some attention to the different schemes, but, for the reasons I stated before, perhaps not so much as most members of the Committee will have done, because I object so much to most of them on the ground of general principle.

10,263. One of the first questions would naturally be, would it not, as to how the gold is to be acquired?—That seems to be the chief question in the matter altogether—that you ought to have a sufficient stock of gold before you begin; that is the general idea.

10,264. You are, of course, aware that India has a very large stock of gold in the country already?—There is no doubt of that.

10,265. And that, so far, practically none of that gold has been tendered to the Government under the present regulation?—Very little has been tendered.

10,266. Do you think there would be any probability of that gold being tendered if a more favourable ratio than 15 rupees to the sovereign were adopted by Government, if, say, 16 or 17 rupees instead of 15 were offered?—I do not like to speak of matters which are more properly within the province of people acquainted with India, but I should think, according to one's experience of human nature, that, if it was possible to exchange gold for rupees at a fixed ratio at which it would be of advantage, probably some gold would be tendered; but what are the exact motives of the people of India in hoarding, and how these would operate, I cannot profess to say as well as people acquainted with India would be able to say.

10,267. I suppose you know that a good deal of gold has been shipped out to India recently, within the last 18 months, and sold at somewhere about 15 rupees to the sovereign?—I am aware that a good deal has gone out.

10,268. If a higher price, say, 16 or 17 rupees were offered, might not some of that gold be attracted in order to secure a profit? If they could sell at 16 or 17 rupees the gold which they bought at about 15 rupees, would not that be a temptation to send it into the mints or into the Currency Department?—All one can say is that no great amount has as yet been sent into the Currency Department, but I think that some would certainly go, if not from India, at any rate from this side, if there was an advantage from the exchange.

10,269. In 1894–5, gold was shipped from India to England on balance to the extent of Rx. 4,974,000?—I would hardly have thought as much as that came back, but I know at different times certain amounts have come back from India.

10,270. And that was not under pressure of famine, there was no famine during that year, it was simply that the fall of exchange raised the price of gold to a point which induced the natives to sell. I mention that in order to put it to you whether there is not a point at which India would sell gold as well as buy it—would send gold into the mint as well as hoard it?—That is a point as to which I think Mr. Campbell would give better evidence than I could, as to what would happen in India. I merely speak as to what would be likely to happen, according to the general experience of human nature; to what extent, I would not like to say without knowing the circumstances of India.

10,271. You have seen in the Government proposals, and in some of the other schemes that have come before us, recommendations that gold should be obtained by borrowing?—If the Indian Government has not a surplus itself and desires to put the transactions straight through and quickly, I do not see any other course open but to borrow, that is to say, if the thing is to be done quickly and thoroughly.

10,272. But would you consider it any advantage to do it quickly and thoroughly, at the expense of adding largely to the debt, rather than to do it slowly and quietly by ordinary trade influences?—I think the difficulty in the matter would be that the Indian Government would have to keep the reserve of gold by which the value of the rupee at 1*s.* 4*d.*, or whatever other rate was fixed, was to be maintained. And as far as the Indian Government is concerned, I do not see how they could get hold of that reserve except by having a surplus in their Budget or by borrowing. As to what might be in other people's hands, it seems to me so doubtful whether you would have so large an amount of gold circulating at any time that that is not material. The main question is how the Indian Government is to get the gold.

10,273. (*Chairman.*) Do you think it better that the Indian Government should get the gold slowly by ordinary operations of trade, or get it at once by borrowing; just say "yes" or "no" to that question, please?—I do not think the Indian Government can get it by ordinary operations. It must have a surplus, or it must borrow.

10,274–5. But, for the sake of the question, assuming that it is possible to do it in the two ways Mr. Campbell mentions, which do you think the better way?

(*Mr. Campbell.*) I may say just one thing. When I speak of the Indian Government, I mean the Currency Department.

(*Chairman.*) Assuming it to be possible, which do you think the better of the two operations that Mr. Campbell put? Would you say that it is desirable to pay the extra cost of borrowing in order to do the thing at once?—I should think not; but I should like to qualify that by saying that, to bring about a great change like this, the preparation of the gold reserve ought to have been taken in hand at the very beginning.

10,276. (*Mr. Campbell.*) Then, in connexion with the question of acquiring gold, would not the ratio established, or attempted to be established, be a very

Sir R. Giffen, K.C.B.

10 Jan. 1899.

important question—the rate at which gold is to be valued in relation to the rupee? If the ratio, for instance, undervalues gold, would not that be a difficulty in the way of getting gold, or, if you did get it, in the way of keeping the gold?—I am not quite clear whether you refer to the difficulty of getting gold out to India itself, or to the difficulty in the way of the Government getting it.

10,277. I allude to the difficulty in getting gold into the Currency Department. For instance, if the Currency Department offered 15 rupees to the sovereign, is it as likely to get sovereigns as if it offers 16 rupees? And, if it has got the gold, is it as likely to keep it, if it offers to give a sovereign away for 15 rupees, as it would be if it demands 16 or 17 rupees?—I think, putting it in that way, there is no doubt that the more rupees you give for the sovereign, the more likely you are to get the sovereigns.

10,278. Therefore, the ratio is a very important question?—In enabling the Indian Government to get it in that way.

10,279. Now, you allude to Italy as a country which attempted a gold standard some time ago, and was not able to keep it. She attempted to establish a gold standard by means of borrowing, did she not?—Italy borrowed, I think, about 16 millions, to the best of my recollection.

10,280. But has she ever been able to declare convertibility?—I think they attempted to declare convertibility at the time, and the premium on gold was very small at one time, but that was a good while ago. The exchange, I think, is now between 26 and 27. It is not a very heavy discount, but quite sufficient to make you say that they have not got the gold standard.

10,281. In fact, is it not the case that, given convertibility, it would now pay about five or six per cent. to send gold away?—About five or six per cent.

10,282. That is an example of an attempt to establish a gold standard with borrowed money. Now, the ratio between gold and the rupee is only another expression for the sterling rate of exchange, is it not?—A different form of the same thing.

10,283. Fifteen rupees to the sovereign, for instance, is 1*s.* 4*d.* per rupee?—Yes.

10,284. Do you believe that the rate of exchange, by its effect on rupee prices, has an influence on trade?—The rate of exchange, like everything else, has a certain amount of influence on trade; what the precise amount and nature of it is, and how it operates, I should think some of the gentlemen around me could speak upon better than I can.

10,285. A high rate of exchange would act prejudicially on prices in India—would send prices of exportable products down?—Of course, all these phrases are relative to what has gone immediately before. Any rate of exchange might come to be the normal rate, and then you could only speak of high or low in reference to that normal rate.

10,286. But a change from a low rate to a high rate would act prejudicially on prices; it would lower prices?—That is to say, if the money of a country like India became of more value, that would operate unfavourably upon prices in India—if it became more valuable with reference to gold. I think, instead of speaking of high and low rates of exchange in these matters, it would be almost more convenient to speak of depreciation or appreciation of the money of the country. One would follow it more closely, because sometimes rates of exchange between this country and others, as Mr. Campbell knows well, are quoted in the money of the foreign country and sometimes in the money of this country; so the high becomes low and the low becomes high, and it is very difficult to follow.

10,287. I will put in this way, that the appreciation of the rupee in relation to gold would have an adverse effect on Indian prices?—That is so.

10,288. And it might check production?—For the time.

10,289. And, if production were checked, exports would tend to diminish?—How far that would operate is really the difficulty which I have in these matters. The adjustments might take place very quickly, but the immediate effect would undoubtedly be what you have described.

10,290. And what bearing would this appreciation of the rupee have on India's competition with silver standard countries?—For the time, I think, there is no doubt it would be adverse, as I think it has been adverse to some extent during the last two or three years; but I am speaking for the time now; I am not speaking of what the permanent effect might be.

10,291. Now, assuming that a workable ratio between the rupee and gold were adopted, and that gold was coming into India in consequence, the question of convertibility would arise, would it not?—In what form? The question is hardly specific enough for me to give an answer to it until I see what you are coming to.

10,292. Assuming that, at 15 rupees to the sovereign, sovereigns have come into the Currency Department on balance, and that the Currency Department has accumulated a fair amount of sovereigns, the question would arise whether the Government could safely undertake to give a sovereign for 15 rupees as well as 15 rupees for a sovereign?—That is the object at which you wish to arrive by a gold standard.

10,293. And the question would arise as soon as you had a sufficient stock of gold to enable you to undertake it?—That would be so.

10,294. Then, if the standard were to be maintained, would it not be necessary to ensure convertibility at least to the extent necessary to prevent gold from rising to a premium, or in other words to prevent exchange from falling to below gold point?—If you undertake to give gold for rupees, it is impossible for gold to rise to a premium. If you undertake to give gold for rupees so long as your gold lasts, it is quite impossible for your gold to rise to a premium. That is what you mean by convertibility.

10,295. If the standard is to be maintained, gold must be found for that purpose, or let out for that purpose?—That is the view I have always taken, that that would be a real gold standard when you made the rupee perfectly convertible.

10,296. I do not mean absolutely convertible; I mean convertible, to begin with, to the extent necessary to prevent gold from rising to a premium?—That is surely the same thing. You give out the gold for rupees, and, so long as you do so, you keep gold from rising to a premium.

10,297–8. I am referring now rather to keeping the foreign exchange straight.

(*Mr. Hambro.*) You are referring to what is called a halting convertibility, not a perfect convertibility.

(*Mr. Campbell.*) Convertibility sufficient to enable the exchange to be kept at whatever figure it is fixed at?—Convertibility is convertibility as far as it goes, but, when you come to consider how far you can manipulate the thing or "correct the exchange," and things of that kind, I am against any Government undertaking to do that, on principle. To say that you will make money convertible, by means of exchange operations, and will take sufficient means to make it convertible, is, I think, hardly a matter for the Government. On the whole, the Government had better keep out of any business of that kind, and work their money automatically. That is a question of general principle. Of course, if the Indian Government finally decide on attempting to manage exchange, and things of that kind, all these questions would be applicable; but they are not questions which I am very much prepared to go into.

10,299. (*Chairman.*) You are opposed to their attempting it?—I am opposed to their attempting it.

10,300. Your opinion is that, if there is to be a gold standard, it must be a gold standard accompanied with absolute convertibility of the silver coinage?—Just so.

10,301. (*Mr. Campbell.*) Suppose that exchange threatened to fall below the gold point, and the Government were unable to sell its Council bills at the gold point, would it be any interference with the automatic working of the currency for the Government to ship home gold in payment of its obligations?—If the Government were to undertake convertibility, the difficulty would hardly arise if they had sufficient means to maintain it, and I do not think the Government would do much good by going into operations outside the ordinary operations of Government, and acting as merchants. Of course, the questions which you have put indicate the kind of operations into which many governments have entered that have had obligations to pay in London, and whose money has depreciated, when they have found difficulty in maintaining convertibility; but I think experience has shown that governments would do wisely to look to convertibility and let other things take care of themselves.

10,302. You expressed an opinion at Question 10,107 that, if a gold standard and gold currency were introduced, the amount of gold required for circulation in the country would be very small?—I think I said that I should have liked more indications of opinion from official sources in India as to what they thought the amount of gold circulating in India would be, as compared with silver; but I said that the best opinion I could form was, comparing the community of India with the community of England, that the amount circulating would not be very large.

10,303. In the previous question, 10,106, you said about 3,000,000*l.*?—That was the sort of general notion that I formed. I do not put it forward as being a very good figure; I put it forward in the absence of any figure from the authorities of India upon the same subject, to which I should rather like to defer if they gave sufficient reasons.

10,304. If that were the case, apart from hoarded rupees, which might or might not be presented for gold, would this necessitate any large stock for the purposes of convertibility?—I think you would require a certain stock in order to give confidence; but I think I said, in answer to the Chairman, that probably 15 or 20 millions at the outside would suffice in my view. That is my opinion, looking at what one believes to be the amount of gold likely to circulate in India—that, if you had not that difficulty about hoarded rupees, such a sum as that, held in reserve, would be sufficient to enable the Indian Government to cope with convertibility. That is always, of course, subject to the difficulty about hoarded rupees.

10,305. With reference to the question of hoarded rupees, you are aware that for some months exchange has been steady at about 1*s.* 4*d.*?—I should say for nearly 18 months now.

10,306. That means that gold is obtainable at close on 15 rupees to the sovereign?—That is so.

10,307. That is about the price of the day, 15 rupees to the sovereign. Now, so long as exchange does not rise over 1*s.* 4*d.*, that is the cheapest price at which gold can be got, is it not?—That is so.

10,308. Then, if these hoards are not brought out now for conversion into gold at the cheapest possible price, would not that seem to indicate that the danger arising from these hoards being presented would be very small?—That is a conclusion, of course, upon which the Indian Government would have to form a practical opinion, but I should say from practical experience that you should not be too hasty in coming to a conclusion that something which it is quite obviously to the interests of many people to do would not, in fact, be done at some time or other, just because at a given moment the operation that you expect has not taken place. I have frequently been struck in past times by noticing that certain things that one expected *à priori*, and according to reason, did not "come off" as it were, but that often, after you have been disappointed and have given up the expectation, you would find that your *à priori* reasoning was right after all. There is always that difficulty, I think, about hoarded rupees, that at any moment it might occur to the people in possession of the rupees that they might go and get gold for them. Even if you find that for a certain time they are not acting as you think they are likely to act, you must always go, to a certain extent, by general principles in these matters, and not be too sure.

10,309. But if the danger arises from these hoarded rupees being presented, would it be wrong in the Government to guard itself against that danger by making convertibility optional, as in France?—That is to say, by the Government assuming to convert or not, as they pleased.

10,310. That is to say, if they thought that the danger arose from an improper operation of this kind?—Of course, in France you would have great mischief arising even now, but for the Government doing all that is necessary; but I suppose you will admit that even France, rich country as it is, does not gain by that system, and that it would be much wiser to accept convertibility absolutely.

10,311. You refer at Question 10,116 to the production of, and demands for, gold, and you admitted that the production had increased very greatly?—There is no doubt of that.

10,312. And I think you also indicated that the demand for gold has also greatly increased?—It would be likely to increase, but, of course, the demands for gold in the last three or four years have been much greater than anything known before.

10,313. But some of those demands have been rather abnormal, have they not, on the part of some of the European Governments?—That is quite true, but I should add the qualification that, at any time that I can remember, you have always had abnormal demands for gold; the market is always more or less in an abnormal condition.

10,314. You think that, if India were to go on to a gold standard, the demand for gold on account of India might inconvenience the market for gold?—I think, like other demands, it would have this effect, *pro tanto*. I was looking forward very much to the case of India going upon a gold standard absolutely, and taking all the risk of those hoarded rupees. In that case, suppose you took to a gold standard, and provided a very large reserve, that would probably cause difficulty in the money market; but I have seen very small demands indeed create very much disturbance. At the present moment I have in my mind the demands of Egypt, to the extent of 2 or 3 millions, producing a distinct effect on the money market.

10,315. But the effect produced by India would be much less, if she acquired the gold gradually, than if she acquired it at once by raising a loan?—I am speaking of India having fully established a gold basis. Then you would have operations from season to season going on, and, at a given time, India would be one of the countries which might produce in certain circumstances a great effect on Lombard Street. In fact, that is one of the difficulties you have to face in Lombard Street with every addition that you make to the number of countries with a gold standard working automatically.

10,316. But looking to the growing increase in the supply of gold, would you attach so much importance to a demand for two or three millions annually on the part of India?—You must not leave out points of that kind altogether, and I should like to remind you of what happened in the years 1863 to 1865 in the money market, at the time when gold was depreciated, and was considered to be very abundant indeed. That was a time when you had very high rates of discount in consequence of demands which had sprung up everywhere—India and France were both countries taking large amounts of gold—and that seemed to show that, if you have gold very abundant, it sets in motion business of different kinds, prices and wages rise, and a great many changes happen, and the people concerned have to fight for their share of gold as much as ever they did.

Sir R. Giffen, K.C.B.

10 Jan. 1899.

10,317. (*Mr. Le Marchant.*) Do you think that, of the conditions bearing on the maintenance of a ratio, the more important is the factor of convertibility or the particular figure which may have been selected?—I think the rate, being fixed, ought to be fixed with reference to considerations as to what the money had been. If you are changing from one standard to another, you ought to change at some rate very close to the market rate at the time, not necessarily the exact market rate, but having regard to the general condition in which the market had been for some time before. If that is selected, that is a fair rate at which to change from one standard to another, provided the change is justified on other grounds.

10,318. In fact it would bear a close relation to the prevailing level of prices in India. One may take it that for any given period there is a relation between the level of prices and the prevailing rate of exchange?—I think these are the sort of questions which should guide you in making a change of that kind.

10,319. And if a rate much higher or much lower than the prevailing rate were taken, it would lead, just so far as it was efficient, to an alteration in the level of prices, that is to say, prices would, adjust themselves to the rate, if it were rendered efficient?—That would be another reason why you should stick to something very near the market rate, so as to avoid any disturbance of any kind; but perhaps you ought rather to make it lower than higher, that might be one of the reasons for taking a low figure rather than a high one. These are all matters of consideration at the moment of making a change.

10,320. You were alluding to some difficulties as likely to arise from the volume of rupee currency being large—large in proportion to any probable margin of gold?—I think that is the effect of the evidence you have had as to the amount of active rupee currency in India, and as to the guess that I thought I was able to make as to how far gold would really come into currency; but, I think, in any case there can be very little question that the silver currency in India must be always larger than her gold currency.

10,321. Then do you think there would be some risk of rupee prices moving in a direction divergent from gold prices?—I did not mention it from that point of view, because, if the rupees are convertible, then there would be gold prices.

10,322. Perhaps in speaking of it you were assuming that the rupee would not be convertible—that the rupee and gold would move independently?—If the rupee is not convertible, then, of course, there is all the effect of having two moneys—really the gold and silver would be independent.

10,323. Do you regard silver as having been in the past an automatic currency for India?—I think so.

10,324. Automatic in respect of both flowing in and flowing out?—It seems to me that silver was a very good currency indeed for India.

10,325. (*Chairman.*) The question put to you is, do you regard it as having been an automatic currency or not?—I do. I consider no currency as good that is not automatic.

10,326. (*Mr. Le Marchant.*) With regard to flowing in, it plainly flowed in with great freedom, but would not one of the conditions associated with the word "automatic" in currency be a freedom in flowing out?—I do not follow that part of the question, because "automatic" is with reference to the operation of the mint. If you can take bullion to the mint and get it coined, that is an automatic currency, and I do not know of any other meaning of the word.

10,327. In the case of countries which have the same precious metal as a basis of value, there is a free flow of the currency metal from one to the other; for instance, between China and India, when the mints were open, and equally between gold-mining countries?—But that is a little away from the ordinary meaning of "automatic." "Automatic" is merely a question of the bullion being deposited at the mint and people taking coins away with them. That is an automatic currency.

10,328. Do you think such a free flow of currency metal as exists between any countries that are on a real par of exchange is advantageous?—There is no doubt that it is advantageous to have a free flow of standard metal between different countries; I do not know that it is absolutely indispensable to a country having a particular standard, because this country had to maintain a standard for a long time, without having any other countries associated with it, but no doubt it would be an advantage to any individual country that other countries are also on the same standard, but it would also have disadvantages.

10,329. Now, with regard to India, with mints open to silver. There would be a considerable difficulty in silver flowing out to England in any large volume, would there not? There would be no fixed par value for such a metal to flow out?—That is no doubt the case—that there would not be the same outlet for silver into the currencies of other countries, as there would be for gold. There would be, of course, still the outlet in the shape of the employment of silver for hoarding and in other ways; but you would not have the outlet that it would go into so many currencies as gold would go into. I think you would have some outlet, because you have a very large silver field in the East, and in the course of time, I should think, you might have other countries taking to a silver standard; but that is the present condition of things.

10,330. (*Chairman.*) The outlet to the other country would really be for the purchase of gold in the same way as you would purchase any other commodity?—Except at times, when there is a disturbance in consequence of the state of the money market.

10,331. That would be the ruling principle?—Yes, but I think Mr. Le Marchant had in his mind gold going to a country like the United States, for instance. I think, as the point has come up, it might be of interest to mention that I have known considerable amounts of gold go to the United States for the purchase of commodities when the United States had inconvertible paper—very considerable amounts of gold—and affecting the money market.

10,332. (*Mr. Le Marchant.*) In cases where countries have lost their gold standard, has not the outflow of gold been promoted in many instances by the existence of paper, or other inferior forms of currency, which have expelled the better currency?—That has been the great danger with many countries in attempting to maintain a standard and not being careful how to do it.

10,333. Just so far as that condition may not be existing in India, India would have better means of retaining its gold?—If a country manages its currency properly, of course it is more able to maintain convertibility than a country which does not. The difficulty is that you do not manage your finances quite so prudently when there is any pressure from any cause. That is one of the dangers to good finance.

10,334. In fact, the possibility of retaining gold would depend partly on currency causes and partly on the general management of the finances of the country?—I think so.

10,335. (*Mr. Hambro.*) You have stuck so staunchly to first principles that I have very little to ask you. But there is one question in regard to which I do not think I quite followed you. If you take the price of India stock now (two-and-a-half's are about 90) that would rather indicate that, *quâ* credit, India stood in the highest credit after England, of any country?—That is so. I think India financially stands very high in the list of nations; in fact I would reckon India almost third or fourth. In point of fact the management has been so good so far as surpluses and deficits are concerned.

10,336. Then in the estimate of the public, at all events, India is a rich and solvent country?—That

is partly, of course, owing to its connexion with England.

10,337. Still, the estimate is, as shown by the prices of stock, that India is a rich and solvent country?—The estimate is that it is a solvent country. As to whether you can call it a rich country, that involves other questions.

10,338. But no other countries can borrow so cheaply as India except England?—I think we may say that a good many men in the City who are not rich can borrow on more advantageous terms than people who are rich, because it is known that they are more likely to pay.

10,339. All the countries that you have given as having tried gold and having failed have been countries of second and third class credit—the Argentine, Peru, Italy, and so on?—Some of these countries were at one time in very good credit.

10,340. If the credit of a country is so great, whether from good management or from anything else, that she can borrow very cheaply, and if, as a matter of fact, she has to import the precious metals every year to balance trade, would not that country be in a better position than most countries, at all events, to maintain a gold standard?—Yes, I should agree that India is in rather a better position than some other countries I have named.

10,341. And if she really went on to what you and I understand to be a pure convertibility, suppose the balance of trade remains as it has done in the past, the probability is, leaving apart those hoards, that she would be able to maintain a gold standard?—She would be able to maintain it, but possibly, at times, subject to very severe pressure.

10,342. Any country on a gold standard, or any standard, has to suffer that?—I think, perhaps, India would have to stand more pressure if a gold standard were adopted than if a silver standard were maintained.

10,343. Still, you think she is in a position to command any currency of a pure nature that she desires?—She is in a relatively better position than some of those countries which I have named.

10,344. Would you go so far as to say that, leaving apart the question of hoards, you think she could command any standard which she wished?—The hoards are the real difficulty.

10,345. Apart from the hoards, you think she could command any standard which she chose?—I think it might be possible for India to have a gold standard, and that the thing could be done with careful and prudent management, but that the Indian Government would have to face the difficulties of the money market at times, which all countries in a certain position have to face, with reference to maintaining a gold standard, and that that is not an easy matter.

10,346. Do you think that those difficulties would be at all lightened if some automatic machinery were provided like the Act of 1844—if a bank were started in India like the Bank of England?—I think it is a very good arrangement in all countries that the Government should have a bank in which to deposit its money and upon which to write its cheques, but how far the circumstances of India would enable such a bank to be established in a proper way I am not able to say. I am old enough to recollect that you had trouble in India in the sixties with the Government having some share in the management of the Bank of Bombay, which did not answer altogether very well; but that would not apply to a bank like the Bank of England.

10,347. I was not asking you as a business matter, I was asking you as an economist, whether it was not a good plan to separate the management of the currency from the Government?—I think it is a good plan. As a rule you ought to have a bank doing business for the Government as well as other people.

10,348. And looking after the currency?—Not so much looking after the currency as doing banking business.

10,349. I mean, automatically looking after it?—What I mean is that you ought to have a mint and that the currency issues ought to belong to the bank and not to the Government. That is the general view that I have in these matters.

10,350. (*Sir C. Crosthwaite.*) Speaking of raising revenue, and what you thought was the backwardness of the Government in dealing with it, you laid stress on the railway revenue and you thought that it might be increased by raising fares and freights. Do you understand that a large proportion of the railways are not in the hands of the Government? I think roughly about three-fourths of them are either owned or worked by companies to whom they have been leased?—The figure I was looking at was the gross income appearing in the accounts of the Indian Government. I could not go into the question of how the railways are managed.

10,351. But you understand that, if the rates were raised, a good deal of the money would go into the hands of the shareholders and not into the Treasury?—I assume that a great deal would have to be considered—that there would be outlays on the other side.

10,352. The railways in India, just like the railways here, are owned by companies to a great extent, and, if more money was obtained by raising the rates and fares, that money would go to increase the dividends of the shareholders in England?—That would be so, so far as the shareholders are interested, but I think it is quite possible that I may have misunderstood the degree of effect of that item in the accounts of the Government. I assumed that, if you put down so much income as coming from railways in the accounts of the Indian Government, that applies not to railways which belong to shareholders, at least not to the whole amount, but it applies to the share which the Government receives.

10,353. If you found that a great deal of the money so raised would go into the hands of the shareholders, and not into the Treasury, you would take a different view of the case?—*Pro tanto*, that would affect my view, certainly.*

10,354. Now, as to import duties. You perhaps know that the rate of import duty used to be 10 per cent.?—All over?

10,355. Yes, I think so, after the Mutiny, and it was subsequently lowered to 7½ per cent., the reason, I think, being that it was found to interfere with trade?—I cannot go into the history quite so far back as that, but what I was speaking about was a comparison of the Indian tariff with the tariffs of other countries.

10,356. The countries that you compared, are they not highly protective in policy?—They are spoken of as protective in policy, but I do not think that applies to the tariffs, because, as a matter of fact, the tariffs have not the effect of protection, because you have not got the industries to protect.

10,357. (*Sir A. Dent.*) You said that silver, in your opinion, was a good currency for India. If it is a good currency, say, at 60*d.* an ounce, would it be an equally good currency, in your opinion, at the present price, say, 27*d.* an ounce?—I think it would be a very good currency at the present price.

10,358. And, if it dropped to 20*d.* or 15*d.*, it would still be a good currency?—I took an extreme case in the second of those memorandums that I wrote in 1879; I looked forward to the possibility of a fall to 6*d.* as one of the things that you ought to consider;

* *Note added by witness:*—I ought to add that, if rates are raised in consequence of a real depreciation of the rupee, the question of raising the rates would still be a proper one, whether the shareholder or the Indian Government got the benefit. The object in that case would be, not to make any heavier charge on those using the railways than what existed before, but to make the same real charge; and this would be quite reasonable, whether it is done for the Government or the shareholder. I understood the questions as bearing on the extent of the benefit the Government might receive from altering the railway rates.

Sir R. Giffen, K.C.B.

10 Jan. 1899.

but there is no reason why money may not be very good, in spite of change of that kind with reference to other money.

10,359. Even though the price fell to 6*d.*, it would still be a good currency for India?—Even if the price fell to 6*d.*, or to put it the other way, even if gold rose to double the present ratio to silver.

10,360. (*Sir D. Barbour.*) You are familiar with the phrase "balance of indebtedness" between two countries?—I am familiar with the phrase.

10,361. Do you think the fact that gold is imported from one country into another is always a sign that the balance of indebtedness is in favour of the country into which the gold is imported?—It is commonly spoken of, and, of course, that was with reference to countries more like England which were in people's minds; but I should say that the movements of both gold and silver, apart from currency, are to be treated just as the movements of any other commodities, and not to be treated specially in any way.

10,362. For example, if there were a number of men in a country who were in the habit of using gold for ornaments, gold would be imported into that country to supply the demand whether there was a balance of indebtedness or no?—Just so; the balance would not affect the question.

10,363. It is the movement of the currency of one country from that country into the currency of another that is an indication of the balance of indebtedness, and not the movement of gold and silver from one country to another as merchandise?—Even then one must be careful. The movement of the precious metals does not always show a balance of indebtedness, because it may arise from operations connected with the value of money, and may be temporary. It does not always show the balance of indebtedness and that money is being taken to pay the difference.

10,364. (*Chairman.*) I have only one question to ask you with reference to something you said this morning, namely, that you thought that the cause of these proposals was mainly the financial difficulties of the Indian Government?—That was the impression conveyed to my mind.

10,365. And not as affecting trade?—Not so much as affecting trade.

10,366. Since you were here before, we have received a letter signed by a large number of manufacturers. That letter will be upon our Minutes, and, as you have not seen it, I should like to read you two or three paragraphs from it, and ask your opinion upon them:—

"We, the undersigned manufacturers in the West of Scotland of cotton and other goods for the Indian markets, desire to put a brief statement before your Committee showing the effects of exchange fluctuations upon our trade.

"We have some reluctance in doing so, but we note from the Blue Book, recently published, that evidence has been given, not only by export and import merchants dealing with India, but also by the tea producers there; while the British manufacturer of goods for the Indian markets has not been represented.

"We desire to draw your attention to the following points:—

"(*a.*) The point brought out by Sir Francis Mowatt (Questions 4290–91 of the Blue Book, Indian Currency Committee, 1898), that it is the producer in India and the producer in this country who are properly comparable, is of much importance, as showing that the latter is equally entitled with the former to a fair share of consideration.

"(*b.*) The unlimited coining of depreciating silver from 1874 to 1893 for all comers, and the consequent fall in the basis of exchange, had a serious effect upon British industries. The extra rupees required to cover the sterling costs were often not to be obtained, or, if obtained, it was only after a prolonged delay—the result being that the British manufacturer had frequently to work without profit, and often at a loss.

"While on this point, we would call your attention to Question and Answer 6110 of the Blue Book, in which it is stated that Glasgow and Manchester exporters do not require to enter into any transactions, unless they choose. This may be the case of the merchant, but the manufacturer, whose machinery is adapted chiefly for the Indian trade, must continue producing, even at considerable loss, rather than face the complete stoppage of his mills or dye works and the disbanding of his trained employees.

"Further, when exchange is fluctuating, the Indian buyer, who cannot foresee the rate of exchange at which payment will be made, is chary of making sterling purchases of goods which cannot be delivered for many months to come.

"But, if he does make such a purchase, and finds, on coming to pay the price, that the exchange has gone against him, and that he has to remit more rupees than he contemplated when he placed the order, he frequently finds some means of repudiating his purchase, with the result that the British producer becomes a heavy loser.

"If any actual proof of the effects of exchange upon our trade were required, we could show (1) that the years of a low or falling rupee were years of restricted output and unprofitable business; (2) that, with the gradual rise of the rupee since 1895, a decided improvement set in and that, too, in spite of war, plague, and famine in India; and (3) that, in particular, we have benefited by the steadiness of the rupee during the present year." What have you to say to that statement?—Of course you do not expect me to answer a long statement of that kind off-hand, and I do not suppose that you read it to me for the purpose of giving me an opportunity of replying to it. It hardly bears on the question as to the motive of the Indian Government in making a change which belongs to a past time. They had not this memorial before them.

10,367. But they had the case of British trade before them?—The impression one gets from all the papers is the emphasis which the Government of India put, not upon the trade difficulty, but upon their own difficulty, and I should still be inclined to say that that is the impression left on my mind by all the proceedings.

10,368. Of course, I knew that you could not answer off-hand. I only wanted to put before you the fact, which was not before you when you were here last time, that there is evidence that it had affected trade, in case you cared to modify the view that you expressed?—I think I may say at once that I am quite aware of a very considerable body of opinion, or a certain body of opinion, amongst gentlemen who some years ago were against the closing of the mints, and are rather now in favour of the present state of things. For a very good reason: business people always object to change, and now you have a feeling in favour of the present attempt to go over to a gold standard amongst people who were previously adverse to it. But I do not think that the statements made in that memorial, as far as I have been able to follow them, would justify one in saying that for India, the people in India, the silver standard was not the best. These are gentlemen writing from the point of view of their own interests as traders, and that is by no means conclusive of the matter. What ought to be looked at is the interest of the people of India, taken as a whole. I think there is no reason to believe that the appreciation of money (which is what has happened to some extent) is more favourable to trade and commerce than the opposite course of a slight depreciation, or even a large depreciation.

10,369. The point is the unstable exchange—it is not a question of depreciation?—That is a question which affects people trading with India, and they attach great importance to it undoubtedly. All I am noticing now is that it is by no means conclusive, and that the subject must be looked at in a much more general way, and with reference to the evidence of people like

Mr. Stephen Ralli and Sir Forbes Adam and many others who are entitled to speak on trade matters.

10,370. Then you personally do not consider that a fluctuating exchange is a disadvantage to trade?—Not so great a disadvantage to trade. It is a question of degree.

10,371. It is not a great disadvantage as a rule?—It is a question of degree.

10,372. (*Sir F. Mowatt.*) Perhaps I may remind you that this question of Sir Henry Fowler's was put to you, not for the purpose of the answer that you gave, but to draw your attention to the fact that there were other considerations within the knowledge of the Indian Government besides the difficulty of their meeting their own sterling payments?—There is no doubt of that.

(*Sir J. Muir.*) I am very sorry I was not present when you gave your evidence before, and therefore I have nothing to ask you. I am also sorry that I was not present when Mr. Galloway gave his evidence, because there were several questions that I should have liked to put to him. As the Chairman has been good enough to read an extract from this memorial from the manufacturers of West Scotland, I should like by-and-by to have another witness from Glasgow, who would give very different evidence to this. Beyond that, I have nothing further to say now.

Sir R. Giffen, K.C.B.

10 Jan. 1899.

The witness withdrew.

TWENTY-THIRD DAY.

Wednesday, 30th November 1898.

PRESENT:

The Right Hon. SIR HENRY H. FOWLER, G.C.S.I., M.P. (in the Chair).

Sir JOHN MUIR, Bart.
Sir FRANCIS MOWATT, K.C.B.
Sir DAVID BARBOUR, K.C.S.I.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. EVERARD HAMBRO.
Mr. W. H. HOLLAND.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

Sir ALEXANDER MACKENZIE, K.C.S.I., called and examined.

Sir A. Mackenzie, K.C.S.I.

30 Nov. 1898.

10,373. (*Chairman.*) You have served, I think, for 36 years in the Bengal branch of the Indian Civil Service?—Yes.

10,374. You went to India in 1862, and retired from ill-health last April?—Yes.

10,375. Will you state what your administrative experience in India has been?—I have filled many offices during that term, including those of Subdivisional Officer, Superintendent of Labour Transport to the Tea Districts, District Magistrate and Agent to the Governor-General with the Nawab Nazim, Under Secretary to the Bengal Government, and Secretary to the Board of Revenue. I was the first Financial Secretary to the Bengal Government when the Decentralisation Scheme took effect in 1877, and after that was Revenue Secretary to Bengal. From 1881 to 1887 I was Home Secretary to the Government of India. From 1887 to 1890 I was Chief Commissioner of the Central Provinces. From 1890 to 1895 I was Chief Commissioner of Burma. In 1895 I was Home member of the Viceroy's Council. In December of that year I became Lieutenant-Governor of Bengal.

10,376. With that long experience, you are pretty well acquainted with the financial conditions of India?—Of course as far as an administrator must be.

10,377. Can you say, from your own experience, whether the closing of the mints had any effect on the amount of currency available in the interior of Bengal?—The closing of the mints had no appreciable effect in the interior of the country, so far as I was ever able to discover. The mass of the people, of course, knew nothing about it, but the dearth of loanable capital in the Presidency towns, whatever its cause, was not accompanied by any observable scarcity of rupees in the rural bazaars and markets or in the interior generally. I never heard that trade operations were interfered with by any such want of coin, and, had they been, it would certainly have come to my notice. No doubt, during the famine year, and in distressed tracts, there was a local rise in the rates of interest, and some people found difficulty in getting loans; but this, as the local officers pointed out, was not due to scarcity of currency, but was the natural result of an excessive demand for accommodation and the failure of the ordinary form of security, to wit, the crops. There has, I believe, been no permanent rise in the rate of interest since the famine ceased. There has certainly been no preference anywhere shown for paying rents in kind. The cultivators in Bengal generally are accustomed to, and prefer, money rents. Rents in kind involve an amount of landlord interference which the Bengal ryot does not like. In Behar they prevail only in a limited area, and no wish to extend the system has been brought to the notice of the settlement officers now working in North Behar.

10,378. Are we to understand that the tenants would have the right to pay either in cash or in kind?—No. In certain tracts rents are paid in kind, and the tenants have by law a right to apply for their commutation to cash. In settlement operations, if the tenants were discontented with cash rents, they would naturally ask the settlement officers whether they could not have the cash rents commuted to corn rents; but there has been no tendency to that. Mr. Finucane, the Revenue Secretary to the Bengal Government, who knows more about the agricultural conditions of Bengal than almost any other living man, is now on short leave home; I saw him the other day, and I asked him this question. I knew that in the settlement proceedings going on in North Behar there had been no tendency of that kind; but there has also been considerable re-settlement going on in South Behar, in which rents in kind do prevail; and I asked Mr. Finucane about those. He says that there

Sir A. Mackenzie, K.C.S.I.

30 Nov. 1898.

several of the ryots have been going to the settlement officers, begging to have the rents in kind converted into rents in cash; and he says this has been done also in a tract of country in Midnapur in Bengal. That is a limited area, in which rents in kind prevail. The ryots there have been applying to have the rents altered; so that the tendency has been rather the other way.

10,379. (*Sir F. Mowatt.*) Those rents in kind are payable to the landlord, not to the Government?—Certainly.

10,380. The Government collects no rents?—The Government collects no rents.

10,381. (*Chairman.*) This is not the land revenue?—No, it is the rent.

10,382. It is the rent paid by the ryot to the man who pays the tax—to the man who holds the land from the Government?—Yes. That was one of the questions enclosed in the list of questions sent to me—whether there had been any preference shown for payment in kind over payment in cash. The evidence shows that the tendency has been the other way.

10,383. Would that indicate whether the tenants were pretty well provided with rupees?—Undoubtedly. If they found any difficulty in getting rupees, you could not imagine that they would come and ask to be allowed to pay in rupees instead of in kind. One reason why rents in kind are objected to by the Bengal tenant is that they involve an amount of interference on the part of the landlord with the crops, and so on, which is extremely repugnant to the Bengal tenant.

10,384. During your term of office as Lieutenant-Governor of Bengal you travelled through a great part of the province?—Yes.

10,385. If there had been a general dissatisfaction arising from a want of currency, you would have heard of it?—Undoubtedly. I was actually mobbed by crowds complaining of the high price of food, but I never heard of any complaint of the want of currency. And, moreover, the land revenue was paid up punctually during the famine year; we gave no remissions in the famine year, except here and there in Orissa. The landlords, of course, complained that they were unable to get their rents, but that was perfectly natural in a famine year; and, besides, they all told me that they would have no difficulty after the famine in collecting their rents, and they are in fact recovering them.

10,386. Was the famine in Bengal last year as severe as the famine in 1875?—Most certainly. Prices started in the late famine where they left off in the previous one. The last famine was every bit as severe as that of 1875, but we met it at one-sixth of the cost, and it has left less marked effects behind it. I was familiar with the state of Behar in both famines, having been on special duty in connexion with the former famine under Lord Northbrook's orders, and I was greatly struck last year by the improved strength of the cultivators in meeting distress. They suffered, doubtless, but not sufficiently to bring them in any considerable numbers on relief works. They have benefited by the railways; they have had good prices for their produce, and, above all, their position has been improved vastly in Behar by the settlement of their rights and relations with their landlords.

10,387. Would you say that no famine in India in modern times has been grappled with so successfully as this famine?—I should say so, certainly.

10,388. Is not that an indication of the improvement of the condition of the people?—There is no doubt of that. I can only speak with authority as regards Bengal; but there is no doubt that the people are much stronger now than they have been, even in Behar, which always was a bad tract.

10,389. Has the expenditure out of the famine insurance fund on railways been a beneficial expenditure?—Undoubtedly. It has, no doubt, had an effect on prices; that is to say, in the old days you had so many closed compartments, as it were, and prices were settled by local circumstances. This time, with more equalisation of markets, we were enabled to meet the famine in a very much more satisfactory manner. In 1875 I had a great deal to do with the operation of sending up rice to Behar. We trusted this time entirely to private trade, and it never failed us; it was quite equal to it. I had a little difference of opinion with the Government of India with reference to one tract where I was doubtful whether the local trade would compass it; I had visited the tract and talked to people who knew it, and there was some fear that the local trade might not prove equal to the emergency; but I got permission to make advances wherever it was necessary, and to give our relief officers leave to import rice if necessary for the works, and the difficulty eased itself off; the trade rose to the occasion and brought up the rice.

10,390. Then if you were told that the Government of India were responsible for the famine; that they could have prevented it; and that they are to be held chargeable for the sufferings inflicted upon the people of India by it, you would not agree with the statement?—It is preposterous.

10,391. Now, were there any complaints during the famine of the fall in the value of silver ornaments?—I have not heard any complaints of that sort, and, as a matter of fact, the labouring classes, who were the chief sufferers by the famine, do not use silver ornaments, but pewter, lac, or brass work. It is fantastic to suppose that natives of India hoard mainly in the shape of ornaments to be sold and melted down when pressure comes. A man buys ornaments for his women for the same reason that men buy ornaments for their wives at home. He may be a little more extravagant than he otherwise would, because he thinks he can realise on them, if need be, but he buys trinkets to keep as ornaments. If he has rupees which he wants to hoard, he naturally keeps them in that shape. I have seen chests full of rupees in the treasury of a wealthy native landowner. The appreciation of the rupee was a clear gain to most hoarders and probably brought out many hoards.

10,392. In Bengal, do they wear rupees as ornaments?—Occasionally; not so much as they do in Burma and other places. They are generally melted down into simple bangles and necklets, and so on.

10,393. Do you think there is a large hoarding of rupees?—I think there is very little doubt of that; you cannot account otherwise for the silver that has gone into India, and has not come out.

10,394. Well, we cannot account for the gold?—Nor for the gold. We know that a large amount of gold has gone into India that has never come out. If it is not out of place to tell an anecdote, I may say that on one occasion, when I was district magistrate, I had to search the house of a native landowner—a very wealthy man, who was also a moneylender. A charge was made that dacoity had been committed, and that a certain amount of property was somewhere in the house of this landowner, and, accordingly, I had to go and search it. I remember there was one chamber built off the staircase with a doorway only two feet square heavily secured. That room was locked. When I got to that, I asked: "What is this"? They said: "This is the treasury." I said: "Of course, I must see that." Then the room was opened, and I found it was simply crammed full of ornaments; some of them extremely valuable; a fair number in gold; many of them encrusted with jewels that looked good, but which were probably, like most native jewels, flawed; but still, there was a great mass of wealth there. This landowner acted as a local pawnbroker, and that would probably account for a good many things; but what struck me most was the number of ornaments that had come into his possession. They were mostly silver ornaments.

10,395. (*Sir F. Mowatt.*) Had he no gold wedges?—No, there was no bullion of any kind.

10,396. (*Chairman.*) Now, I think you had some communication with Mr. Bourdillon, who was Commissioner of the Patna division during the famine?—

Yes, he happened to be home on furlough recently, and I communicated with him, and he entirely endorses what I have said. He says that, had there been any want of silver coin in Behar, he must have heard of it, and I believe that is true for the whole of the rest of Bengal. Such a scarcity must have come to the notice of the district officers, and so to the notice of the Government.

10,397. I was going to ask you whether in Behar the monetary transactions of the people are not in copper?—They are, and not only that, but they ordinarily express themselves in terms of copper pice.

10,398. What were the relief payments made in?—They were made in copper at first; but gradually, so to speak, a sort of taste for silver was created, and these payments steadily increased in popularity; but I may say that at no time was any difficulty felt in obtaining silver from the bunneahs in exchange for pice. That is Mr. Bourdillon's statement.

10,399. What is a bunneah?—He does money-lending as a rule, but he is generally a grain merchant also.

10,400. You say there was no difficulty in obtaining silver where it was required?—No, Mr. Bourdillon was entirely clear about that.

10,401. Taking your general experience of Bengal, what proportion would you say of the monetary transactions of the bulk of the people is in copper?—In rural markets they are almost entirely in copper. Their purchases are small.

10,402. So far as they are concerned, questions of gold currency, and silver currency even, are not very important?—No, and that is one of the reasons why I have held that the difficulties of introducing a gold currency are exaggerated.

10,403. How are their wages paid?—The wages of the agricultural labourer are for the most part, I think, paid in kind; then the labourer sells to the bunneah, or he uses the stuff as it suits him. That applies to the great bulk of the agricultural labouring class. Of course, in the case of servants of Europeans, and so on, they are entirely paid in silver.

10,404. They are paid monthly?—They are paid monthly, as a rule. It is almost the general rule in Bengal and Behar that the wages of the agricultural labourer are paid in kind.

10,405. Now, just before we leave the famine in Bengal, have you anything to say about the position of Bengal under the permanent settlement—I mean about the land revenue being a lighter charge there?—I consider that was the reason why we were able in Bengal to dispense entirely with remissions. In Behar we had large and substantial landowners, for instance, the Maharaja of Durbhunga, who not only paid his land tax, but made quite regal contributions towards famine relief. Then we have also small landowners in Behar in considerable numbers, and they paid their revenue even in the famine year in the ordinary way. There were no applications for remissions, or anything to show that they found any difficulty in paying.

10,406. Of course, it is open to this observation: That the fact of the Zemindars easily paying their land revenue to the Government indicates that they have a large margin, which some people think ought to belong to the Government, instead of to the Zemindars?—That is so, although you have to discount that by the fact that the margin is distributed over a large number of people. There is much sub-infeudation in Bengal.

10,407. Now I come to the re-opening of the mints. I do not know whether you wish to express any opinion, first, as to the policy of closing the mints?—I think it was a measure which was absolutely called for at the time, and the pity is that it was only a preliminary step which had to be followed by others. I hope the appointment of this Committee indicates that those further steps are to be taken.

10,408. At the time that policy was entered upon, you were in Burma?—Yes in 1894.

10,409. At all events, that step, as a step, was not only one of which you entirely approve, but one that you thought was absolutely necessary?—Yes.

10,410. What do you say as to the re-opening of the mints?—I think that would be ruinous. It would involve, undoubtedly, very heavy taxation.

10,411. Why?—Because the Government would have such an additional charge thrown upon it to meet its home remittances that it could not avoid some increase of taxation. Every fall of a penny in the exchange means a very large demand upon the Government.

10,412. There would be a great increase in the expenditure of the Government of India, which the existing revenue would not meet?—Quite so.

10,413. Now, what is your objection to new taxation?—Well, even in Bengal—Bengal has the reputation of being the safest province, I believe, in India—but even in Bengal we could not do it without serious risks of trouble and political disturbances, and, I think, the taxation already imposed since silver began to fall is as much as the country can properly bear.

10,414. I do not know whether you have read the evidence of Sir Antony MacDonnell as to the North Western Provinces?—Yes, I have seen that.

10,415. He expressed a very strong opinion that the imposition of new taxation would be a serious danger to the public peace?—The danger in the North-West, of course, is more real and urgent, if I may say so, than in Bengal, because the people of Bengal ordinarily are quiet enough; still, they can give trouble, and in the Eastern districts the people are as difficult to manage as the people in the North Western Provinces.

10,416. Then would you say that, if it would create political excitement in Bengal, it would *à fortiori*, create at least as much excitement in other parts of India?—Undoubtedly; it would be a most unfortunate position.

10,417. We are told that imposing new taxation is a "mechanical operation" which the Government ought to face, and could face easily. Now, if you were called upon as an Indian administrator to perform this "mechanical operation," will you tell us where you would raise this money?—If I had to "turn the spigot of taxation", I should find it very difficult now to suggest anything. Everything has been exploited that could possibly form a source of revenue. The land revenue of Bengal is permanently settled, and cannot be touched. As to the temporarily settled provinces, if you raise your land revenue there, the people would naturally complain that they were being inequitably treated in comparison with the landowners in Bengal.

10,418. And that would involve a new settlement?—Yes.

10,419. That would be a process extending over many years?—Yes. Of course estates are always coming in for settlement, even in Bengal, but it would be extremely difficult to establish an entirely new *modus* of settlement alongside the existing one. If you put a new settlement upon one estate which falls in, which is simply an *enclave* of other estates, the owner of that estate will feel himself greatly aggrieved. The landowner is, moreover, not bound to take the settlement; he can refuse to take the settlement, and then you are bound to give him a *malikhana* of 10 per cent. on the revenue which you have proposed to him. The effect of that would be, probably, that you would raise your demand, and the landlords would refuse to settle, and you would have to pay them a *malikhana* of 10 per cent. on your demand, so that you would after all, probably, not get anything like the amount demanded. You would also have the Government loaded with the direct management on the spot (I am talking at present of Bengal) of a large number of small estates which could only be managed at a very great expense, and I think the profit at the end of the operation would be uncommonly little.

Sir A. Mackenzie, K.C.S.I.

30 Nov. 1898.

10,420. Where a man refuses to come under a new settlement, how long does the new arrangement last; it may be an annual arrangement, I suppose?—The arrangement lasts as long as the landlord refuses settlement. The old policy was to farm out such estates. That has been abandoned in Bengal since Sir George Campbell's time, and we now manage all such estates directly. We manage them either by *tahsildari* establishments or by sub-deputy-collectors.

10,421. But as a practical man you reject the idea of tampering with the land revenue?—Oh, yes; that would involve the whole faith of the British Government.

10,422. I think the land revenue represents about one-third of the income of the Indian Government?—Probably.

10,423. Now to come to the next item of taxation; I think the salt tax ranks next?—I have had no papers or books about me since I have come over here, but I think the salt tax is quite as high as it ought to be now, and my own view is that it ought always to be kept low and kept in reserve as a war tax.

10,424. You would very much deprecate any increase of the salt tax?—Certainly.

10,425. In fact you would like to see it reduced?—Yes.

10,426. What do you say about opium?—That is going away altogether, I am afraid.

10,427. It is a falling revenue?—It is a falling revenue undoubtedly. It is a thing on which it would be very dangerous to count.

10,428. How about excise?—We have got the excise duties as high as we can make them, as long as you do not allow out-stills in Bengal. That, of course, is an income at the disposal of the local governments, and you cannot get much more out of it than you are getting now.

10,429. Then, stamps?—Stamps are a universal subject of complaint. They are very high. The stamps on litigation are constantly being complained about. As the country progresses, no doubt, the revenue will grow of itself. You might get something, perhaps, out of probate.

10,430. Do you think that a large revenue could be obtained from Death Duties in India?—There are many difficulties in the way owing to joint families and so on, and these have prevented Government from resorting to probate duties. I have never been of opinion that it would result in a very large increase, but it might bring in something. It is one of those little trifles which the Government is entitled to consider.

10,431. But we are now talking of millions?—That, of course, is out of the question.

10,432. Now, have you anything to say about income tax?—No.

10,433. I think the agricultural classes are exempted from income tax?—Yes, and practically, since things have settled down, the tax is collected with wonderful ease. It is very much disliked, naturally, but I should leave it alone. I do not think you would get much more out of it.

10,434. Two other sources have been suggested to us recently for increasing the revenues of the Government of India. The first is Customs duties. We are told that they are exceedingly small, that they are not appreciably a burden on the people of India, and that they might be very much increased. They amount now to a uniform 5 per cent., and they bring, at the rate of 5 per cent., about 4 crores?—I think they are high enough myself, and that to increase them would affect the imports injuriously.

10,435. You think it would affect trade?—It would affect trade. Of course I am not a trader, but that is my impression.

10,436. Would you agree that they would require to be enormously increased to bring in any substantial increase of revenue?—I think so.

10,437. There was another matter which was put to us yesterday, about raising railway rates. One witness yesterday was of opinion that we could have a very large increase of income by increasing the railway rates?—I do not think you would find that the trading community would agree to that. The opinion in Calcutta is that rates are high enough already.

10,438. But, apart from the complaints of traders, what is your opinion as to the practicability of it?—I think it would be bad policy.

10,439. You think it would diminish trade?—I think so.

10,440. How about passenger fares?—They are low, and the lower you make them the more traffic you get.

10,441. It is the low rates for passenger traffic that have attracted the heavy traffic there is?—Undoubtedly. The people of India, taking them all round, are not wealthy, although I do not admit that India is so poor a country as it is often represented to to be; but by raising the railway rates you would injure the traffic undoubtedly.

10,442. May we take it as the result of your survey that you do not think that a heavy increase in the taxation of India is a practicable policy which you could recommend to this Committee?—I hold that opinion most strongly both on financial and public grounds. There is another aspect of the case which I ought to refer to. Supposing you throw fresh burdens on the provincial governments, you compel them to increase their provincial cesses. These are already sufficiently large, and they are only made palatable to the people by the pledge that they shall be spent on local and provincial objects. To raise the provincial cesses in Bengal, in order to give a cheap rupee to Assam, appears to me a monstrous proposal.

10,443. There has been an increase in the taxation of India since the fall of the rupee?—Oh yes, a very heavy increase—something like 6½ crores, I think, since 1884.

10,444. Therefore we do not commence with a clean sheet. The experiment of increasing taxation in order to meet the loss accruing from the fall of the rupee has been already tried?—Yes, and it has been carried as far as it can be, I think.

10,445. That is all we need go into, on the subject of increase of revenue. Now you have retired from the Government service?—Yes.

10,446. Then I will just ask you what are your views upon the question of a reduction of expenditure?—I will not deny that there are all sorts of little pickings that the local governments can make here and there in various ways. As the Financial Secretary who introduced the Decentralisation Scheme in Bengal, I made a comfortable little purse out of them, but that is not big enough to meet Imperial wants. When you come to talk of Imperial wants, the only items of expenditure the savings on which would have any material effect are the civil charges and the military establishments. I say that neither could be reduced without risk, or to an extent likely to meet the deficit caused by a further fall in the rupee. As regards the army, I have myself little doubt that the pay and pensions of the native soldiers will again have to be raised ere long, and every improvement in the position of the English soldier at home means extra cost in India to India.

10,447. The pay of the native soldier has been raised?—It was raised a year or two ago.

10,448. When we raised it in my time it took, I think, 300,000*l.* or 400,000*l.*?—I think it is almost practically certain that, with the rise of wages that has certainly begun, and will probably go on, you will have to raise the pay of the native soldier again. You cannot get the best class of men without it.

10,449. Is there not another question coming up with reference to expenditure, namely the wages of the police?—That is a very pressing question. We have increased the expenditure very considerably in Bengal, but we have not made it adequate yet. We have not got the class of men we ought to have.

10,450. And you cannot get them until you pay more for them?—Exactly.

10,451. In fact, the weakness of the Indian police arises, to a great extent, from its cheapness?—Yes, the low pay. What we have found in the judicial service is, if we pay the native servants well, we can get men as honest and straight as any class of men in the world. A more satisfactory class of officials than we have in the uncovenanted Civil Service you could not possibly get. We have not yet got so far in the matter of police. We have a police school now in Bengal, and they are trying to get the educated natives to join the force, but, hitherto, the officers have been men promoted from the ranks, bringing up all their bad traditions with them.

10,452. That means that, instead of reducing your civil expenditure, the probability is that you will have to increase it?—I think so, in several directions. There is a great outcry in the native press about the rate of pay of the subordinate civil establishments—apart from the police—the process servers, and so on. Year after year, in the Bengal Council, the suggestion has been made that the recommendation made by the Committee of Judges and others, who inquired into the question, should be carried out, and the answer has always been, "we have not got the funds."

10,453. I suppose, in India, the majority of the people expect the Government to do everything?—Entirely.

10,454. And, I suppose, the Government has effected all improvements in the past?—Well, it has been the leader.

10,455. I mean canals, railways, roads, sanitary works, irrigation—all these have been initiated by the Government?—Practically, the Government has been the developer of the country, as I have said. Then, as to the reduction of expenditure, I wanted to say that, as regards the Civil Service, I hold very strongly the view that we are carrying to the verge of rashness the introduction of the native element in the higher branches. We have already barred Europeans very largely from the uncovenanted service. Any serious reduction in the numbers of Europeans now in the service could not take effect for some years to come. Vested interests must be considered. But it would, in my opinion, be folly to attempt such reduction. We have barely enough of the European element as it is, and, even in Bengal, are constantly hampered by its weakness. I might explain this further. We have a large number of sub-divisions in Bengal in districts where indigo is grown by European planters. There are also a considerable number of new mills and industries growing up, not only in Calcutta and its neighbourhood, but also at places in the interior where European capital is employed, and Europeans are engaged; you must have Europeans in charge of these districts, or you cannot avoid difficulties. I have found the greatest difficulty in manning these sub-divisions with Europeans, because the uncovenanted service and the covenanted service have been very seriously depleted in strength in the last few years, notwithstanding the attempts that have been made to strengthen the latter. I would deprecate strongly any further reduction of the European element in the service.

10,456. But, even if there was a reduction of the European, and an increase of the native, element, the native element requires, practically, to be paid on the European level?—Of course they like it; that is the claim.

10,457. At any rate, it is an unreliable financial source to look to?—It is; and, of course, now in the provincial service all have been put on the same level. That has had the effect of removing certain anomalies, and the natives have displaced a certain proportion of the European service, but the pay is all alike.

10,458. Then what have you to say as to possible reductions in public works?—The very classes who vaguely clamour for reduction in expenditure are those who are most constantly demanding improvements, and further outlay on communications, schools, water-supply, and so on. Some natives, it is true, denounce railways as made only in the interest of the English capitalist, and would have no more of them. But the majority look to Government for improvements of all kinds, and grumble greatly if they do not get what they want. They are also constantly clamouring in the native press for increased pay to native establishments, as I have stated already.

10,459. Now, perhaps, you will deal with the charge that the agitation against the silver standard is a selfish official or Indian Government movement?—It appears to me that that ignores the fact that the Government is at present the principal agent in developing the country. Everything prejudicial to the financial position of the Government is detrimental to the country at large. Any temporary profit of the exporting merchant due to depreciated exchange is made at the cost of the Government and of India—their interests are identical—and, if the depreciation involves extra taxation, the mischief is enhanced. I have said that the Government is the chief agent in developing the country, but—and this is a very important point—we must remember that the operations of the Government are restricted, first, by considerations of its general financial position, and, secondly, by the fact that it can only apply its capital to certain forms of development. It can make railways, and canals, and roads, but it cannot take up and develop new industries, though, without industrial developments, its railways, for instance, fail of their full effects. Hence the importance of facilitating the influx of private capital, and this can only be done by establishing a stable par of exchange.

10,460. Have you formed any opinion as to whether private capital has been flowing in or flowing out of India?—Flowing out, most certainly, since the fall of the rupee.

10,461. Not flowing out on other grounds, but on the ground of the instability of exchange?—Well, I suppose most men did what I did; I got as much of my money home as possible, when exchange had got as high as I thought it was likely to go to.

10,462. Will you tell us what you think about the tea industry, which is a very important industry in India?—I am myself largely, for a man in my position at least, interested in tea, although I think I must honestly say I wish I had never seen tea outside a teacup. Nevertheless, I have not been able to convince myself that the Government would be justified in yielding to the cry of the tea planters for a cheaper rupee. My view is, and it is formed with some care, that the tea industry is at present suffering more from over-production and internal causes than from a rise in exchange, and I believe it could adjust itself to a stable 1*s.* 4*d.* rupee, just as it flourished while the rupee was even higher.

10,463. What do you consider the range of years in which the tea industry flourished?—That is a matter of statistics, and I do not carry them in my head.

10,464. But it has been flourishing?—It has been flourishing, undoubtedly, in the past.

10,465. For a period of years, during which there was a high rupee?—Oh, yes; higher than it is now, certainly.

10,466. Now, have you any fear of Chinese competition?—I have no fear of Chinese competition, if only the Indian planters and agents show energy and resource in meeting the requirements of the tea markets of the world. But I am afraid that the trade does not display so much resource as it might.

10,467. At the present moment the tea producer in India beats the Chinese producer in the English market?—He has beaten China out of the market for reasons which may depend on the quality of the tea.

10,468. Chinese tea is the cheapest in London, and yet the Indian tea commands the market?—Yes, I suppose Indian tea is really cheaper.

Sir A. Mackenzie, K.C.S.I.

30 Nov. 1898.

10,469. It is better, I suppose?—Yes; less of it makes more infusion.

10,470. You said that you thought the tea industry was suffering from internal causes. What do you mean by "internal causes"?—The first cause I put down is bad management. It is by no means easy to find men competent to manage large gardens. Agents push their young kinsmen and friends into assistantships and managerships, and these pick up their experience at the cost of the shareholders. The conditions of profitable cultivation have changed. Machinery has come in extensively, and the practice of consolidating a number of neighbouring gardens under one management, and with large central factories, is becoming usual. These want expert management, and it is hard to get. In fact, I know well the difficulties which there are in getting experienced managers in India. May I expand that by an instance in my own experience of how bad management has affected things? I have, unfortunately, a large interest in a series of gardens, which have been converted into a sterling company, and are held in London. Having nothing to do the other day, I went to the last annual meeting of the company. The meeting consisted of the agents, and a few assistants in the office, who held a few shares for the purpose of voting. I was the only outsider present. The report was laid on the table. Now, that garden had been paying 7 per cent. dividend for a considerable number of years, and last year it paid nothing. But the report entirely failed to account for the fact; there were the usual statements; the bad year was put down to this, that, and the other thing; but they had taken no account in the report of the excessive cost of rice; and there were others of their figures as to which I asked for explanations, which, with some little difficulty, I at last got; and then it appeared that the fact had been entirely concealed in the report that the manager had behaved so badly that they had had to dismiss him. That was not brought out, because, of course, the agents are responsible for the appointment of the managers, and they do not like their shareholders to know that their men have failed; but there it was. It was nothing but bad management. If the garden had been properly managed we should have had—perhaps not 7 per cent. dividend—but we should have had something. That state of things is much more general than is supposed. Then there is the excessive cost of procuring labour.

10,471. Is that an increasing cost?—It has been pretty high for a number of years, and it ought not to have been increasing. This is a matter which has been the subject of much discussion. Government has, perhaps, been a little too *difficile*, and has not yet done all it might to facilitate recruitment.

10,472. Now, you said something about the excessive cost of rice. I suppose some part of the wages are paid in rice?—The coolies holding contracts under the Act are entitled to have rice provided by the employer at about 3 rupees per maund. Of course, rice this last year was much above that, and that has to be taken into account.

10,473. That has imposed an additional burden on the tea planter?—Well, the real wage is practically so much increased.

10,474. Is there anything else you want to say upon that?—Then another cause is, what I call excessive agency charges. I believe, if the planters were polled, and dare speak their minds, (which they are not always able to do), this would be indicated as one of the principal obstacles to making gardens pay. Agency houses start gardens and induce people to take interest in them. They often provide for insufficient share capital. Difficulties arise; the agency charges add to these. Money is advanced at high interest. Eventually the gardens are swallowed up by the agency houses, and the shareholders lose everything.

10,475. Would these causes be affected by the highness or lowness of exchange?—I could not say that. I may say that I have been interested, or had shares in, something like a dozen gardens, and four of them have been swallowed up in that way; which is a high percentage.

10,476. Now, the next point would be about the value of the rupee; have you formed any opinion as to that?—You mean, whether it would effect a disturbance in rural economics

10,477. I mean, the present value of the rupee is 1*s.* 4*d.*; it has been at 1*s.* 4*d.* about 12 months?—Well, it has been hovering about that.

10,478. Has that caused any disturbance in the monetary affairs of the country?—None whatever. With regard to rural economics and the land revenue, it has caused no disturbance whatever, because, of course, it is only within comparatively recent years that it has been below that figure. The fall to 1*s.* 4*d.* is in itself a great relief to the payer of Government revenue and other fixed charges, as the revenue was settled in permanently settled tracts when the rupee was better than, or nearly as good as, 2*s.* sterling, and this is, of course, the simple answer to those who decry as taxation any proposal to prevent a further fall. Even in the temporarily settled tracts no harm can possibly be done, for we are even now unable to take anything like the proportion of assets to which the State is entitled, and the settlement holders are being let off on extremely easy terms. Prices of grain have risen enormously, and they get more than their fair share of the unearned increment. They can well afford to pay the Government demand, without relying on any fresh depreciation of the currency.

10,479. In the temporarily settled lands the land revenue is fixed with reference to the gross value of the produce, is it not?—It depends very much on the particular tract of country. The assets are taken to be the rents. In some provinces we also fix rents, and in fixing the rents we take prices into account. But we cannot raise the revenue assessment to such an extent as to rudely disturb the established standard of comfort. I am not talking of the permanent settlements. In addition to the permanently settled land, of course, we have temporarily settled land even in Bengal. The whole of Orissa is temporarily settled. There they had a settlement which was originally for 30 years. At the time of the famine of 1866, it was considered that the country ought not to be disturbed by a fresh settlement, and that settlement was extended for another 30 years, so that for 60 years it has been the same. In the meantime rents have risen so enormously that we are able without raising the ordinary rents to get as large an increase of the Government revenue as we could decently take. We were able to touch up privileged rents, which had been originally fixed at something like half rates. Those were levelled up, as a matter of principle, in order to assert the point; but we could have taken much more if we had had a free hand and raised the rents all round.

10,480. Is your view this, that, taking an average of temporarily settled lands, the tenant—I do not mean the ryot, I mean the man who pays the land revenue himself, the Government tenant—is now getting a higher price for his produce, and he is getting his rupee, even at 1*s.* 4*d.*, at a lower price than when the bulk of the settlements were fixed?—The man who pays the Government revenue, as a rule, is getting higher rents.

10,481. That is another way of putting it?—They have undoubtedly been able to raise rents.

10,482. They have raised rents, and they are paying no more, and the rent was fixed at a time when the rupee was at a higher value?—Quite so.

10,483. Therefore there is no grievance there?—No.

10,484. Have you anything to say about the introduction of a gold currency?—I do not profess to speak at all as a currency expert, but, from an administrative point of view, I have always thought that the difficulties in the way of introducing into India a gold currency, which seems to me inevitable with a gold standard, have been much exaggerated.

India had a gold currency years ago—in Madras, a real working currency—and I believe it would again be popular. It is said the transactions of the people, generally, are too petty for gold. If we are to go by the transactions of the bazaar, we should have a copper standard only. No doubt there are an enormous number of transactions that, even with a gold currency, would still be liquidated in silver, and the silver token currency would have to be large enough for these purposes; possibly a large proportion of these might come to be made in gold, but my own impression is that the circulation of gold would be mainly confined to the Presidency and larger towns, and perhaps the railway stations. I think that the analysis of the currency of the world that is given in the Report of Lord Herschell's Committee on Indian Currency, shows that an extremely small amount of gold is sufficient to enable a country to work with a very large token currency.

10,485. Do you believe that the demand for gold would be excessive?—I do not think so. Of course, that is a mere opinion formed after my residence in India. Another point is this: it appears to me that, as the country developes, the use of paper in the form of currency notes and credit notes of various kinds advances, just as here. Nor do I think the presence of gold in the currency would stimulate the hoarding of gold. There is a huge mass of gold already in the country.

10,486. Do you expect to see any of it come to the mints?—I should expect it, but it is impossible to say. As I have said, if a man wants gold now, he has to buy it, and you do not propose to give away the sovereigns.

10,487. Irrespective of the ratio of *1s. 4d.*, and of a gold currency, do you think that India requires a stable exchange?—I consider it of vital importance to India to have a stable par of exchange.

10,488. Why?—Without it you cannot look for any influx of European capital save through the Government, and I have already stated what the limitations on Government action are. With a stable par, it appears to me that money would flow from the cheap money market to the dear one.

10,489. It would be regulated automatically, as it is in all other countries in the world?—Practically, I think so. I do not pose as an authority on that subject.

10,490. There is one point to which you desire to call attention—the area under food crops?—That is a matter which has been referred to in the Calcutta press, and I mention it here, because I do not think it has been brought out, so far as I have read, in the proceedings of the Committee. It is stated that the area under food crops has, in the last 15 years or so, expanded only about 12 per cent., while the population has increased by about 22 per cent. The area devoted to non-food crops, *i.e.*, to exportable and merchantable products, has in the same period increased by over 80 per cent. It is suggested that these figures (and Mr. O'Conor will be able to check them) imply that there has been excessive stimulation of merchantable exports by a falling exchange, and that in fact a large section of the population is practically being partially starved to pay India's debt with a falling exchange. I must say that, as regards Bengal, I have viewed with some apprehension the way in which jute, for instance, is supplanting rice in the Eastern districts. There can be no doubt that the non-agricultural population of India, some 130 millions, has suffered, and is suffering, severely from the enormous rise in the price of food and the enhanced cost of imported goods. This seems to me a reason for deprecating any measure which would have the effect of increasing the tendency to abandon food crops for non-food products. The aim should be to develope the country as a whole, by the introduction of outside capital, and not merely to stimulate a particular class of products.

10,491. The strength of that last argument is the introduction of outside capital. That is what you want to stimulate?—That is what we want to stimulate by a stable par of exchange.

10,492. Have you anything to say about illicit coinage? The chief police officer of Bengal has expressed an opinion that the effect of the token coinage being, as it is now, very much in excess of the bullion value, would probably, or might probably, be to lead to an increase of illicit coinage?—That is rather *à priori*; all I can say is that there has been no increase whatever in reported cases. I think far too much is made of the supposed stimulus likely to be given by the restriction of the currency to the coinage of spurious rupees made of good silver. Illicit coinage would only pay if carried out on a large scale with the aid of machinery. The fraudulent coiners in India are poor, without capital or appliances. They work with primitive implements, and can never turn out a perfect coin. On the other hand, the native shroffs are extremely keen to detect false money. The amount of false money which could be turned out by Indian coiners would not be large enough to affect the currency materially. Since the agitation has begun here, much has been made of this matter of false coinage, and the papers, for reasons of their own, report any such cases pretty fully. I may mention, as a typical case, one that is reported in the Calcutta *Englishman*, which I received this morning. It appears that the police received certain information, and they raided a house where they found a coiner, a native of Rajputana, working away. His day's work was beside him. The police found four forged rupees; the effect on the currency must have been appalling. That, I believe, is a typical case. The ordinary false coinage cases that you get in the interior are simply cases of silvering over copper coins, and, of course, that only imposes on extremely ignorant rusties.

10,493. May I ask whether that false coinage could be easily detected?—The report did not state it, but my experience is that false rupees can be pretty easily detected, because they can never get the milling perfect all round.

10,494. (*Sir F. Mowatt.*) I think you said in the early part of your evidence that there had been no rise in the rate of interest since the famine, at all?—No permanent rise.

10,495. Does it rise or fall according to the busy or slack season?—Not as a rule. Everything in India is very conservative in the interior and practically stationary, but, of course, when a time of real pressure comes, as in the case of a famine, a man has little security to offer, and the bunneah asks for more, but it is pretty stationary on the whole.

10,496. During the period which we have heard described as a period of unexampled stringency last year, did the local rates of interest rise?—It did not affect them at all, save as I have stated already. It was the European market business that was affected by the want of loanable capital.

10,497. You are speaking there particularly of your own province?—Yes, but one would have been bound to hear of want of currency, if it had happened. All these things affecting rural economics are bound to come under the notice of the local officials, and so under the notice of the Government.

10,498. You said that there was no preference for paying rents in kind rather than in cash. How is the amount of rent in kind fixed; is it fixed with reference to the rupee as it varies in value, or is it a fixed quantity of produce?—Rents are fixed by the chaffering of the markets, of course, where they are not customary, as they generally are.

10,499. But I mean, when the payment is in kind instead of in rupees, what fixes the amount of the kind?—There are two forms of that. In some cases the landlord actually takes a share in the crop, in other cases he takes the estimated value of a share. As a rule, in most parts of Bengal, he actually takes the crop and carries it off. That is what the ryots do not like—the interference with their crops by the landlord.

Sir A. Mackenzie, K.C.S.I.

30 Nov. 1898.

10,500. Then the amount would vary with the temporary value of the rupee?—No, because the landlord takes the crop.

10,501. You said people complained to you a good deal of the high prices of food stuffs. Do you mean the higher prices immediately resulting from the famine, or do you mean that the prices of food stuffs have gradually risen of late years?—There is no doubt that the prices of food stuffs have risen enormously. Not having the figures before me, I should be afraid to say what the rise has been year by year or quinquennium by quinquennium, but certainly since I have been in India prices have nearly doubled.

10,502. When wages are paid in kind, do the wages rise with the rise in the price of food stuffs?—No, if the wages are paid in kind, the man will get the same number of seers that he always gets.

10,503. So that practically the wages rise with them?—The value of the wage rises.

10,504. You were asked, I think, about the raising of the railway rates. At present do you know whether the Indian railways produce a net revenue to India; do they more than pay their way?—I should not like to speak about that without referring to statistics, which I have not by me.

10,505. I think we have heard that there is a net loss of from half a million to 2½ million tens of rupees a year from the railway system of India?—I daresay that is right, but I have no figures.

10,506. Do you know whether there has been an actual attempt to raise the rates; was there not an attempt made in Bengal?—That I cannot say.

10,507. With reference to the necessity of new taxation in case the mints were opened, we have had it put before us that a rising or falling rate would lead to so rapid an extension of trade, and thus to so rapid an increase in the yield of existing taxation, that the temporary difficulty in meeting the gold debt would diappear in that way; is that your view?—No, I think that it is unsound. I do not believe in it. I do not believe in a depreciated rupee leading to a rapid extension of trade. I do not see how depreciation of currency can lead to extension of trade.

10,508. Do you think that, speaking generally, the rates of wages and the prices of food stuffs are affected immediately, or shortly after, by the rise of the rupee?—They are affected slowly. Prices have undoubtedly risen enormously, and wages have risen too in my time very considerably. Wages in the large towns, and in the neighbourhood of large towns, have risen materially, and even rural wages have risen since I first went to India. But, as I say, India is a conservative country, and, as a rule, changes are not so rapid there as here.

10,509. But they do follow slowly?—They do follow.

10,510. If, therefore, the rupee were to fall permanently to 1*s.*, wages would follow?—Wages would rise; the people would want more wages.

10,511. You said, with reference to the labour for tea gardens, that not only wages have risen, but you expect it will be necessary to raise them still higher?—I do, especially if there is a great stimulus given to free emigration; that is, the emigrant who is taken up outside the Act altogether, without Government interference. There has been far too much interference hitherto in my view. I have always been very much inclined to advocate—in fact, I was President of the Commission which originally suggested—free emigration to the tea districts, and I have always regretted that the free emigration which was introduced was a perfect parody of what was intended. But, if you have free emigration, either the Government must take care that the wages of the labourer are adequate to keep him in a proper condition—which is an interference I take exception to—or, if you leave him alone, and he goes up on his account, you must offer him wages to keep him there when you have got him, and the planter will in his own interests do so.

10,512. (*Sir J. Muir.*) You have been 36 years in the Bengal branch of the Indian Civil Service, and during that time you have filled a great many different offices. Were you paid in rupees the remuneration for your services?—Certainly.

10,513. Then was it to your personal advantage, when you had to send money home, to get as high a rate of exchange as you could for your rupees?—Naturally.

10,514. So that, to a certain extent, so far as your pocket was concerned, was there a natural inclination on your part to see a high rate?—Naturally. One would have been glad to see a higher rate—the rate prevailing when I entered the service.

10,515. Quite naturally, and what was natural in your case would be natural to the other civil servants in India?—I suppose the civil servant has as much regard to his own interest as outsiders.

10,516. In other words, every civil servant would have the same regard to his own interests as yourself?—Yes, but not to the exclusion of principle. He is bound to consider, and does generally consider, the good of the country he serves, as much as, or more than, his own interests.

10,517. I mean, the interests of civil servants were identical with what the Government regard as their interests?—I hope so.

10,518. Was it the case that the Government always desired as high a rate as it could obtain?—Well, I was governing provinces for 12 years, and I cannot speak for the Central Government; but naturally, of course, Government wishes to pay its debt at home on the most favourable terms. Nobody ever denied that.

10,519. You made the statement that "to raise the "provincial cesses in Bengal, in order to give a cheap "rupee to Assam, appears a monstrous proposal." Now will you tell me who ever proposed that?—That is rather a condensed way of putting it. If the proposal is to raise taxation in order to establish a cheaper rupee in the interests of the tea trade, or in any other individual interest, then I call that a monstrous proposal.

10,520. But has anybody proposed that, as you have put it here, in the interests of Assam?—Assam stands for the tea interest generally. I fancy that has been proposed.

10,521. Are the interests of Assam different from the interests of indigo, of coffee, and of wheat?—I will alter the shape of my reply, and put it broadly, thus: If it is proposed to tax the native population of India, in order to subsidise any particular trade of India, then I say that that is a monstrous proposal.

10,522. Are you aware that many of the leading merchants in India hold views diametrically opposed to yours?—I have no doubt that every branch of the currency question has many people both on the one side and on the other.

10,523. You lived for some time in Bengal, and in Calcutta, latterly?—Yes.

10,524. Are you aware that Messrs. Ralli Bros. and Messrs. Graham are the largest importers of Manchester and other goods into India?—They are large importers.

10,525. You would admit that they are capable men of business, as proved by the success with which they have carried on their business?—No doubt.

10,526. Of course, you would naturally infer that they know what is best for their own business in regard to importing Manchester and Glasgow goods into India?—I suppose they know what pays them.

10,527. We have had representatives of both those firms, giving evidence before this Committee. Would you be surprised to hear that their views are entirely opposed to yours?—I am sorry for them.

10,528. That is to say, you are sorry for men who have made huge fortunes in India on the same lines?—I have always found that huge fortunes are made by

practical qualities, and not by abstract views on economic questions.

10,529. Would you be surprised to hear that these gentlemen consider that exchange should not be fixed in an arbitrary way, but should be left to be arrived at automatically?—Well, that is a currency conundrum which I do not profess to be able to solve. All I say is that what India wants is a stable par of exchange. How to get it, is the business of this Committee.

10,530. You have given us a good deal of information with regard to tea, and I think you mentioned to us that you yourself were interested in 12 different tea estates?—At different times I have been interested in 12 of them, more or less.

10,531. And that, out of those, four had been swallowed up by the agents?—Yes.

10,532. It would be interesting for the Committee to know what interest you had in tea?—I am not prepared to go into my private concerns, even to inform the Committee. It would probably not be a great deal to you, but to me the amount was considerable, running to a good many thousands of pounds.

10,533. Your remark is, "I am myself largely, for me at least, interested in tea." It would have been interesting to us, at all events to me, to have known what your interest was, but you prefer not to state it, and I am satisfied. Now, you say, "I have no fear of "Chinese competition, if only English planters and "agents show energy and resource in meeting the "requirements of the tea markets of the world." Are you of opinion that the Indian planters have not shown energy and resource in the past?—That is a general criticism. They have certainly done something to get new markets, but I cannot say that they have yet risen to the difficulties of their position, and I think there is a great deal that they might well do; but I am not writing a treatise on the management of tea gardens at present.

10,534. No, but you are making a broad statement here, and I am trying to test it. Can you suggest anything that they could do which they have not done?—Oh, yes; there is the trade in India itself, which they have not touched. I may say, for instance, if they were only to take a leaf out of the book of the Government of Bengal, they could do something. We have within the last few years developed an enormous—you can hardly call it trade—but an enormous consumption and a big market in quinine, by placing quinine in pice packets in the bazaars throughout the interior of the country. These small packets are packed up by the inmates of the gaols; it is an industry for the juvenile and female prisoners. You know that, when your syce or Indian servant has fever, the first thing he asks you for is quinine, and the next thing he asks you for is tea. I believe that, if the refuse of the warehouses—the dust and so on—were done up in these small packets, suppose they were sold in, say, 2 anna packets throughout the bazaars of India, you would have an enormous market there which has never been touched.

10,535. Are you aware that that has been tried?—It has not been tried, so far as I know. It has been talked about, I know.

10,536. It has been tried in Calcutta to my certain knowledge. Your suggestion was given effect to, and it was tried again and again and again, and we found that the natives of India, while very willing, as you say, when sick to have tea as a gift, would never pay for it?—If you would only employ men of the type of colporteurs, and give them a good commission, and send them about in the different bazaars, you would have got a market in the course of time. The taste would have had to be created, but a good deal could have been done in time.

10,537. To my personal knowledge, it has been tried and failed?—It will fail until you find some way of packing your tea, so as to keep it from getting mouldy in the packets. But I doubt whether the thing has ever been seriously attempted and persevered in.

10,538. Now, you have made some strong statements here, and I think it is only fair to the tea industry that I should put questions to you in order to test them. You say, "I consider that the tea industry is "at present suffering more from over-production and "internal causes than from a rise in exchange, and I "believe that it could adjust itself to a stable 1*s.* 4*d.* "rupee just as it flourished while the rupee was even "higher, and I have no fear of Chinese competition, "if only Indian planters and agents show energy and "resource in meeting the requirements of the tea "markets in the world." Then you explain that the first of the internal causes to which you refer is bad management. What do you mean by bad management?—I mean bad management.

10,539. What is bad management?—It is, for one thing, putting men in charge of gardens who have no special qualifications for managing them; young fellows sent out from home without any particular qualifications or training. I know by sad experience how difficult it is to get a good manager for a tea garden. I think I could tell off on my ten fingers all the men who are now recognised as really first class managers. Men are sent over without any special education or training.

10,540. Would you be surprised to hear that I could find you 20 in our own employment who are capable and able managers?—Well, I am glad you have them. You have been more fortunate than the agents I have had dealings with.

10,541. And I am very glad that we have them. Then have you sufficient warrant, do you think, for saying that "agents push their young kinsmen and friends into assistantships or managerships"?—Most certainly. That is distinctly my experience.

10,542. I am glad to say that my experience is the very antipodes of yours. I find that, in all well-conducted tea companies, the agents put aside anything of that sort, and the standing rule is that no man is to be appointed simply because he is a friend or relative of a partner or director in any of the companies that I know?—They do not advertise for them. They do not go to the public schools or colleges. They get lads introduced to them either by their friends or shareholders or something of that kind. I have had scores of such young men applying for work under Government—when they had failed in tea.

10,543. Nay. In Glasgow we advertise regularly for assistants, and select the best men that can be found, irrespective whether the applicant is a friend of a partner or director at all. We take qualifications only. I am afraid your experience has run in a particular groove?—My experience has been unfortunate, I admit.

10,544. Are you aware that there are many companies and firms who select men specially trained and qualified for these positions?—I do not know what qualifications you insist upon. I know that the engineering qualifications required by a good many firms are exceedingly meagre. I think a very few weeks in an engineer's shop is about the most that is ordinarily required.

10,545. Then you refer to the excessive cost of rice, and I think you said that it had doubled in price?—I think that is roughly about the fact. I feel certain the price of rice has doubled in price since I went out to India. Mr. O'Conor has the exact figures.

10,546. I have the figures here. The price of rice in 1892 was 111; in 1893, 121: in 1894, 120; in 1895, 100; in 1896, 111. Then we come to the famine year, when everything was upset as regards the price of rice, and the price was then 159. For the first six months of the current year, 1898, the price has fallen back to 114; so that the price now for the first six months of the present year is less than it was in 1893–94, and only three higher than it was in 1892 and 1895. Now, was there any difficulty in getting English capital to India prior to the closing of the mints?—I am not sufficiently expert in Indian exchange, banking, or anything of that sort, to know much about it.

Sir A. Mackenzie, K.C.S.I.

30 Nov. 1898.

10,547. We have had it in evidence here by other witnesses?—I do not profess to give evidence on trade questions or banking questions.

10,548. I may mention that we have had it in evidence here, that, prior to the closing of the mints, for any suitable enterprise there was no difficulty in getting English capital out to India?—A great deal of English capital, no doubt, went out.

10,549. English capital went out in jute mills, cotton mills, indigo estates, for the growing of wheat, and for tea?—It is not going out now, at any rate.

10,550. No, it is not. Unfortunately this action of the Government of India in fixing arbitrarily 1*s.* 4*d.* is killing the trade of India?—Well, that is a matter of opinion.

10,551. Then, do I understand you to say that you sent home, when the rate was at 1*s.* 4*d.*, all the available funds you had in rupees?—I forget the exact rate, but I remitted home all I could when the exchange was fairly high.

10,552. You sent it when you thought the rate was as high as it would be, because you were afraid that that rate might not be permanent or that it might go lower?—Quite so; I sent it before the mints were closed.

10,553. You, of course, were a civil servant, and it is not to be expected that you could understand the general effects of an increase of customs duties so well as if you had been a merchant paying those duties, or a merchant exposed to those duties?—I do not admit that. I think everybody interested in the Government of India is obliged to take as wide a view as he can, and to make himself acquainted as far as he can with all the local conditions and circumstances of trade; and the circumstances and conditions of the trade of Calcutta would naturally have an interest for the Lieutenant-Governor of Bengal.

10,554. Are you aware that we have had evidence given by Messrs. Ralli and Messrs. Graham to the effect that they would be pleased to see a 10 per cent. duty on their own goods imported into Calcutta?—They would not have to pay it.

10,555. It would require to be paid by their goods?—It would be paid by the unfortunate consumers.

10,556. They would have to pay it in the first instance. Then you seem to be very much opposed to the increased growth of jute in India?—Pardon me, I never said anything of the kind. I never said I was opposed to the increased growth of jute in India. I brought to your notice a fact which is alleged in certain correspondence in the Calcutta papers, with reference to the area of production of food grains being reduced in consequence of so much land being devoted to non-food crops, but I never said that I was opposed to the growth of jute. I should say, on the contrary, that that was a great blessing to the country.

10,557. You said, I think, that the prices of rice had been doubled?—I said "during my time in India." You may go back for a few years, and give me figures which I cannot check in the least; but all I know is that in the last 30 years the price of rice has very nearly doubled.

10,558. The price of rice for the first six months in this year has fallen to 114, according to the figures that we have had?—I do not know anything about that. Of course prices ought to have recovered to a certain extent from famine rates, and no doubt they have done so; but I am certain that they have not gone back to anything like the rates that they were, say 15 years ago.

10,559. Are you aware that a very large number of the inhabitants of Bengal, especially in or near Calcutta, are employed in these jute mills, so that the growth of jute gives employment for a very large number of people?—Undoubtedly, and a great blessing it is. I am not in the least opposed—in fact, I have always favoured the development of that and other industries.

10,560. Are you aware how many people are employed on the tea estates?—I cannot say, but it would be a very considerable number.

10,561. Would you be surprised to hear that it is over a million?—Possibly. I am glad to hear it.

10,562. Then are you aware that indigo is being very severely hurt by a high rate of exchange?—I fancy it has been hurt by other things, just as tea has. Indigo has had to suffer from the competition of aniline dyes, and from a variety of causes. For instance, they have had to pay more for their indigo plant than they used to. As you know very well, in the old days the indigo trade was not carried on on commercial principles at all, but landlord accounts and trade accounts were so mixed up that it was almost impossible for the indigo ryot and cultivator to know where he was; if he had a balance in his favour on the manufacturing side, he found a balance against him on the rent side. That has now been done away with. It is all done now on a commercial basis, and the planters do not get such large profits as they did. But indigo, like tea, has suffered from other things besides exchange—if it has suffered from exchange.

10,563. Are you aware that there is a fear now that indigo will be killed, so far as its growth in India is concerned?—Well, it has died out in the Bengal districts; it is now almost confined to Behar, but the causes of that had nothing to do with exchange. It ceased to pay.

10,564. If this artificial dye that they have in Germany is going to interfere keenly with India, should we not try to give what encouragement we can to the planters of India?—If you mean to say that you are to subsidise any particular industry at the cost of the taxpayer, I do not agree. The interests of any individual industry are not to be compared with the interests of the country at large. All these questions have to be looked at from the point of view of the interests of the country taken as a whole. I submit that the great thing to do is to get European capital drawn into India, and I believe that that can only be done by establishing a stable par of exchange. But, if you say that you are to consider only the interests of tea or indigo or any one industry, I say you have not stated the problem completely.

10,565. (*Mr. Campbell.*) Regarding the 1*s.* 4*d.* rate, you are aware that the Government have not absolutely fixed upon that figure?—Quite so.

10,566. In 1893 they left it an open question?—Quite so, although practically public expectation has always accepted that rate, since the Herschell Committee's Report.

10,567. But it was not, in fact, fixed?—No, I admit that at once.

10,568. It was to be fixed afterwards, in the light of the experience that might be gained?—Yes.

10,569. Do you think that the experience of the past five years points to 1*s.* 4*d.* as the correct rate?—I think 1*s.* 4*d.* is the rate indicated in many ways to be the proper rate. The actual rates appear to tend towards it, and public opinion seems in favour of it, and the main point is, that you cannot go below it without extra taxation; at least, that is my opinion.

10,570. Of course, to be a success, 1*s.* 4*d.* should not only be the rate which enables the Council Bills to be sold, but a rate which will attract gold to India as currency?—Quite so.

10,571. And that it has not done so far?—A certain amount has gone in, but I do not think you can say that the experiment has been sufficiently tried with reference to that, because it has never been recognised as the finally fixed policy. Nobody has ever felt certain about it. There has been an uncertainty about the whole question which interfered with a fair trial of the experiment. But I do not profess to be a currency expert.

10,572. I think you said you do not think that exchange has any influence on trade?—I never said that.

10,573. I thought you said that, in answer to Sir Francis Mowatt?—I did not say that. It may have a most material influence for a time, undoubtedly,

and a fluctuating exchange must be a most serious hampering to trade.

(*Sir F. Mowatt.*) My question was, whether rates of interest and rates of wages followed approximately the rise or fall of exchange?

(*Witness.*) I certainly do not hold the view that exchange has no influence on trade.

10,574. (*Mr. Campbell.*) Then, if 1*s.* 4*d.* were found, after experience, to be an unsuitable rate, or a rate that interfered with trade, and did not allow currency to come into India, would you be in favour of revising it?—Well, I should like a good long experiment tried first. Nothing is more dangerous than to hold out ideas of revision. What you ought to do is to put your foot down, and say: "This is our plan, and we will do our level best to carry it through."

10,575. But, if the experiment is continued too long, the country may suffer in other ways—through the want of currency, for instance?—Well, I cannot go into that. I am sceptical as to the probable want of currency.

10,576. Then as regards the money market, you admit that money was very tight in the great trade centres?—Undoubtedly.

10,577. Although you say it was easy enough in the rural districts?—To put it broadly, money was tight in the European, and not abnormally so in the native, money markets.

10,578. When interest rose in the large centres to 12 and 14 per cent., do you not think that that was a serious burden on industry?—It was a most serious condition of things, no doubt. The state of things in Calcutta was as bad as I have ever seen it.

10,579. If you have rates at that level, and money impossible, or almost impossible, to obtain at all in the great trade centres, it does not minimise that fact very much to know that in the rural districts things are going on as usual?—It does not minimise the difficulty felt by Europeans trying to get accommodation; but I suggest that there was no actual want of currency in the country at large.

10,580. You spoke of the low rupee affecting industries like tea; does not the low rupee affect the production of all exportable articles as well as tea, for instance, jute and indigo? — These are economic questions, upon which I am unable to speak with any authority; but my view is that any temporary benefit gained by the exporter by a low rupee is only temporary, and that it does not as a rule, until some time has elapsed, find its way to the producer. But I do not profess to speak authoritatively upon these matters. I have my own opinions, but I think you will get this much better from others.

10,581. You spoke of the large proportion of land devoted to the produce of non-food crops, compared with the land devoted to the production of food stuffs. Is it not the case that land suitable for tea, for instance, is not suitable for food crops at all?—Well, I would not put it so broadly as that. Some tea lands are not suitable for food crops, but there is no doubt whatever that the lands that grow jute in Eastern Bengal did originally produce rice. As a matter of fact, as Mr. Finucane told me the other day, there has this year been a slight recession of the jute area, in favour of rice. Of course, in rough jungle tracts and places of that kind, new land would be more suitable for tea, but the greater part of the Dooars and Assam, and so on, produce magnificent rice crops.

10,582. If it is the fact that lands unsuitable for rice or other food grains are devoted to tea and other industries, you would consider, would you not, that this is an advantage to the country?—So far as that is the case, but that only applies to the hill teas. I think that any land that would grow tea in the plains, would grow other crops. I do not wish for a moment to depreciate the importance to the country of these industries, and the importance of obtaining European capital for them. I think this development of the tea, and the jute, and other, industries, has been an enormous gain to India. I have always held that the one thing for India was to develope the industries of the country, and to convert the population, as far as possible, from being an entirely agricultural population.

10,583. (*Sir F. Mowatt.*) I think what you said was that you objected to the way in which jute, for instance, has largely supplanted rice?—I think it is an element in the case that the Committee ought to take into consideration. I merely brought the point forward because it has been mentioned in some of the Calcutta newspapers, and it has been stated that no one had brought that point to the notice of the Committee. Therefore, when I was asked whether there was anything else that I had to say, I thought it right to call attention to that matter.

10,584. (*Sir A. Dent.*) You told us that you have seen chests full of rupees in the Treasury of a native landowner, and that on another occasion you had seen a large accumulation of ornaments, some of them being of gold, but that you came across no bullion or bars. Later on you mentioned that there was "a huge mass of gold" in the country. Can you tell us in what form that huge mass of gold is? — That is impossible to say, but we know that an enormous mass of gold has gone to India which has not come out.

10,585. It is denied that this gold is available?—That is another question; but there is a large amount of gold, which cannot have disappeared into the earth.

10,586. In the event of the Indian mints being opened for the coinage of gold sovereigns, do you think that that gold would come out?—It is a matter of speculation. At present there is no employment for it at all. People who have got it, even if they feel disposed to utilise it, cannot do so. It might come out. It is a matter of speculation. What I wished to say was that I *do not* believe myself that the amount of gold that would be necessary to finance a gold currency is so enormous as it is sometimes represented to be.

10,587. (*Sir C. Crosthwaite.*) Suppose we established a gold standard and we had a gold reserve, do you think that the danger is that these vast hoards of silver would be brought out in order to clear off the Government gold reserve?—I do not think so.

10,588. You said you saw a great quantity of silver—chests full of silver?—Yes.

10,589. But silver masses very largely, does it not?—Oh, yes, it bulks largely.

10,590. Have you any idea how many rupees go to a ton of silver?—I cannot tell you that.

10,591. You may take it from me that there are something less than 90,000 rupees in a ton of silver. That would be an enormous quantity?—Yes it would. I suppose each of these chests contained about a lakh.

10,592. And how many chests do you think there were?—Well, it is a long time ago now.

10,593. What I mean is, a ton of silver would not be worth more than between 6,000*l.* and 7,000*l.* sterling?—Each of these chests, I should think, would contain that.

10,594. You do not think that they would be brought out?—No, I do not see why they should.

10,595. Where do you think the large hoards of silver are? A man, in order really to affect the currency, would have to produce a crore of rupees?—I think they are widely distributed.

10,596. Do you think the native princes have large hoards?—I think most of the hoards of the native princes have been invested in British investments.

10,597. Do you think that the natives who have large hoards would use them in order to take out the Government gold reserve?—I do not believe that they would enter into speculation of that sort.

10,598. I notice, you said that we cannot raise the Bengal permanently settled revenue, and that it was difficult to raise the revenue of the temporarily settled tracts without laying ourselves open to a charge of unfairness?—Yes.

10,599. Has that difficulty prevented us, as a matter of fact, from raising the assessment of the temporarily settled tracts, wherever the periods fell in and we were justified by prices and other causes in raising

Sir A. Mackenzie, K.C.S.I.

30 Nov. 1898.

them?—That appears to me to be a very different situation.

10,600. I merely want to know the truth?—It is suggested that you should impose a universal cess on account of the depreciation of the rupee all over India——

10,601. My reason for asking you is because it might be inferred from your evidence that the Government had not raised the revenue in temporarily settled tracts, on account of some supposed unfairness?—I have said that we have taken all that we decently could.

10,602. In the Central Provinces the revenue was being assessed when you were there?—Yes; I followed you. I should like to say that, while we have raised the revenue, having regard to prices there, we have never raised the revenue with an eye to the requirements of the Government.

10,603. With reference to the use of railway rates for the purpose of taxation, I suppose you know that, if those rates were raised, the increased profits would not all go into the pockets of the Government?—Quite so.

10,604. A proportion would go into the pockets of the shareholders?—Yes.

10,605. Therefore it would not be, financially speaking, a good method of raising revenue, because the whole proceeds of the tax would not go into the Treasury?—Exactly.

10,606. (*Chairman.*) I suppose, with the exception of the State railways, there is no case in which some proportion of the profits would not go to the shareholders?—I think that is so—some proportion.

10,607. (*Sir C. Crosthwaite.*) With regard to reducing expenditure, do you think that anything can be done by reducing the salaries of the covenanted civil servants?—Not if you want to get the best class of men.

10,608. Could anything be done by substituting natives for Europeans to any large extent in the Civil Service?—I am entirely opposed to it.

10,609. You would probably have to pay them the same?—You would have to pay them the same, and, as I say, the European element is not too strong.

10,610. With reference to what you said of the suffering of the non-agricultural population from the great increase in the cost of food—you admit that wages have risen?—Wages have risen, but not as much as the cost of food.

10,611. Do you hold that the falling rupee stimulates exports from India?—I suppose it must do so for a time—temporarily, at any rate.

10,612. You think it stimulates exports like jute, which, to a certain extent, take the place of food grains?—I should say so. This is not my contention, you know, but I think there is something in it, and something which ought not to be ignored.

10,613. I suppose the agricultural population would cultivate those crops which would pay them best, irrespective of whether those crops are food grains or non-food grains?—No doubt that is so.

10,614. With regard to illicit coinage, I suppose machinery would be necessary to turn out rupees to any great extent?—Undoubtedly.

10,615. And it would be very difficult for the coiners to get the machinery?—It would be very difficult for them to get the machinery, and still more difficult for them to work it without being found out.

10,616. It would also be necessary to provide for the utterance of coins?—Yes.

10,617. And to a large amount, if large profits are to be made?—Illicit coinage is a mere bugbear; there is nothing in it.

10,618. You do not think that any native banker or merchant would lend himself to such a thing?—No.

10,619. You say you heard no complaints of want of rupees—of coins—in the interior of the country, but that you heard complaints of the high price of food. Nothing that the Government has done in the way of closing the mints, would increase the price of food, would it?—Not so far as I know.

10,620. So far as any contraction of currency has occurred, it would go the other way?—Certainly.

10,621. It would tend to lower prices? — It would tend to lower prices, if anything.

10,622. (*Mr. Holland.*) Referring to the diminished area of land bearing food grains, you say that there has been an enormous rise in prices. Will not that fact lead to an economic remedy—will it not lead to more land being devoted to the cultivation of food crops?—As I said, there has this year been a slight increase in relative proportions.

10,623. And high prices will stimulate that?—It ought to in all ordinary countries, but, as I say, India is very conservative. The agricultural conditions do not respond with the same rapidity and directness that they do in other countries. They do respond, but not with the same rapidity and spontaneity.

10,624. With reference to silver hoards, I suppose they are of two kinds, hoards of ornaments and hoards of rupees. The hoards of ornaments have depreciated, but the hoards of rupees have appreciated?—Quite so.

10,625. Have you any opinion as to the relative proportions between the two?—Oh no, it would be impossible to tell.

10,626. (*Mr. Le Marchant.*) You were discussing the prices of rice, and speaking of an increase in prices since the time that you went to India. Will you look at the Table in our Appendix entitled, "Variations in the retail price of rice since 1861." The column headed "Patna" gives the price of Bengal rice?—It is practically doubled, if you take those figures.

10,627. If you take the 5 years ending 1865, the average price was 57, and if you take the 5 years ending 1895 prior to the famine, it was 107?—Yes, practicaliy double, as I originally suggested.

The Witness withdrew.

Mr. R. C. Dutt, C.I.E.

Mr. ROMESH C. DUTT, C.I.E., called and examined.

10,628. (*Chairman.*) You were selected for the Indian Civil Service at the open competition held in London in 1869?—That is so.

10,629. You joined the service in 1871?—That is so.

10,630. Will you tell us your experience in the Indian Civil Service?—After serving in the lower grades, I held appointments as District Magistrate and Collector between 1881 and 1894 in various districts in Lower Bengal, and as Divisional Commissioner in Burdwan and Orissa Divisions between 1894 and 1897. I retired in October 1897 after 26 years' service.

10,631. The Departments that you were in did not deal specifically with either currency or accounts?—No.

10,632. But they gave you the opportunity of studying the condition of the agricultural labouring classes?—Yes.

10,633. And it is with that experience and your knowledge of Indian affairs that you approach this question?—That is so.

10,634. I will first ask you what you thought of the closing of the mints. Had you any opinion at that time on that point?—We were not consulted. I hardly knew anything about it.

10,635. You were in India when the step was taken?—No; in 1893 I was in this country on furlough.

10,636. You are aware, I suppose, that the rupee had been steadily falling for a large number of years?—Yes.

10,637. At the time when the mints were closed in 1893, they were closed on the ground of the fall of the rupee being a very serious danger to the financial position of India?—I heard that vaguely in this country.

10,638. Since you have been here, you have thoroughly mastered the new proposals of the Indian Government?—In a general way, yes.

10,639. Will you just say, in your own language, what you would like to say first as to the effect of those proposals?—The first effect is likely to be this, that it would lead to a general increase of taxation in India. Because all the taxes are paid in rupees, and, by closing the mints, the value of the rupee has been enhanced, and, if the same number of rupees are taken now as were taken before, it means a real increase in taxation.

10,640. Have you any figures as to what the raising of prices has been? When you went to India in 1871 the price of silver was $65\frac{5}{16}d.$ an ounce, and the average rate at which the Secretary of State sold his bills was 1*s.* $10\frac{3}{4}d.$ per rupee?—Yes.

10,641. The rate began to fall, I think, materially in 1878 or 1879, and, when the mints were closed in 1892-93, it had gone down to 1*s.* $2\frac{1}{2}d.$?—That is about it.

10,642. That is a fall of 8*d.* in the rupee in those years?—Yes.

10,643. Did the proposals of the Government of India to arrest the fall of the rupee have the effect of raising its value?—Yes, I think it was 1*s.* 2*d.*, if I remember rightly, in 1893, and it is now nearly 1*s.* 4*d.*, so that within this last five years the value of the rupee has been enhanced by 2*d.* as compared with gold. With regard to the fall from 1871 to 1893, I may be allowed to explain that the Indian Government and the Provincial Governments got a natural increase in their revenue in consequence of the fall. The land revenue and other revenues went up in this way. The prices in rupees rose all round; the prices of food grains rose, and, as the Government in its recurring settlements made that a ground of enhancement—because the Government as landlord is entitled to an increase of rent if the price of the produce rises—there was a natural increase in land revenue. Then also with regard to the income tax; as the incomes, estimated in rupees, went up, the Government got an increase of the income tax; so that, while there was a fall in the value of the rupee from 1871 to 1893, Government was directly, and in a natural way, getting an increase in the revenues as estimated by the rupee.

10,644. When you talk of an increase in the income tax, will you explain that further?—Suppose a man's income in 1871 was 1,000 rupees a year. If his real income remained the same, then, by the falling of the rupee, his income as valued by the rupee would be something like 1,200 rupees.

10,645. What do you mean by his real income?—His income estimated by the produce of the country. I am speaking of people outside those in Government employment — not members of the Government service. I am speaking of merchants and traders, agriculturists, and farmers—people outside Government employ.

10,646. You think there was such a rise in prices that, practically, profits were increased to that extent?—Profits as estimated by the rupee. If a man's real profits remained the same, the value of the rupee having fallen, his profits, as estimated by the rupee, must have risen. If his income was 1,000 rupees in 1871, and if the rupee had in the meantime depreciated 8*d.*, his income in 1893, as estimated by the rupee, must have risen, and, therefore, the Government would get an increase in the income tax obtained from that man.

10,647. Do you mean that they would get more rupees?—They would get more rupees. The depreciation of the rupee has not been a loss to Government, because in this way there is a general increase in taxation without making the burden heavier on the people—there is a general increase in taxation as estimated by the rupee.

10,648. Do you think that in India itself—I am not talking now of external trade or payments out of India—the internal trade has increased?—There has been an increase in the price of food grains within my experience. Between 1871 and 1893 there was a considerable rise in the price of rice.

10,649. Was that accompanied by an increase in wages?—To some extent; and the landlords were able to increase their rents, and the Government in all cases, except where there were permanent settlements, were able to increase their land revenue on the basis of an increase of rents.

10,650. What would have been the position of things if the rupee had remained stationary?—Then the increase of the land revenue would not have been so marked, as estimated by rupees. I will try to explain myself in this way. Suppose the Government land revenue of a district not permanently settled was 3 lakhs in 1871. In the 22 years between 1871 and 1893, the prices of food grains rose; where rice sold at 1 rupee 8 annas per maund in 1871, it sold in 1893 at, say, 2 rupees per maund. In the same way there is an increase in the prices of wheat, barley, jawar, and bajra, and all the principal staple foods of India; there was a general increase of prices in all food grains. Therefore, when the Government came to revise the settlements, it found that there was a general increase in the prices of food grains all over the country, and obtained a legitimate increase of probably a lakh of rupees solely on the ground of increase in prices. If there had not been that increase, the Government might have raised the land revenue a little, but certainly not so much, if prices had remained stationary.

10,651. I was dealing with the connexion between the falling of the rupee and the rise of prices. Do you consider, for instance, the opening up of the European markets to wheat is a factor?—It is a very small factor.

10,652. Do you think the increased consumption of rice is a factor?—I do not think so, for there has been an increased cultivation. I think the main reason of the rise in prices is that the rupee has depreciated between 1871 and 1893. And the land revenue, as estimated in rupees, has increased.

10,653. Supposing, instead of the Government arresting by their action the fall of the rupee, they had allowed the fall to go on, and that the rupee had gone down to 6*d.*, what do you think would have been the effect of that?—I hardly think it would be possible; but, if it did go to 6*d.*, it would not have made any difference, because the land revenue would rise at the very next settlement; the rise in the prices of food grains would be so considerable that, without any effort on their part, the Government would get a natural increase in their land revenue; they would get a natural increase in the income tax, and a natural increase in the proceeds of almost every tax in the country.

10,654. (*Sir F. Mowatt.*) You are assuming that the prices would immediately follow the fall of the rupee?—Yes.

10,655. It is on that assumption that your opinion is founded?—Either immediately or within a short time; and my experience during the last 26 years in Bengal has been that, as the rupee has gone down, prices have risen.

10,656. (*Chairman.*) Will you apply that now to the salt tax?—I do not remember the incidence of the salt tax.

10,657. The salt tax is now $2\frac{1}{2}$ rupees per maund. That is a fixed sum?—The Government would be quite justified in increasing the tax in proportion to the fall of the rupee.

10,658. Then take the excise duties and apply the same argument—I mean the duties on spirits and liquor. I want to see where you think the Government income would rise?—In this way. On the

Mr. R. C. Dutt, C.I.E.

30 Nov. 1898.

liquor distilled in Bengal the Government imposes a duty of something like 2 rupees for each gallon distilled. When the rupee depreciated and food grains all rose in price, the Government would be justified in imposing 2 rupees 8 annas, or 2 rupees 12 annas, or 3 rupees.

10,659. That is dealing with what the Government might do, but that is not what has actually occurred. I understand your point to be this, that automatically, by the reduction in the value of the rupee, the revenue has increased?—In most cases, excepting in those cases where the Government imposes an arbitrary sum, in which cases the Government has the power to increase that sum, and it would be justified in increasing that sum in correspondence with the fall of the rupee.

10,660. Now, your next point, I think, is that the Government have improperly appreciated the currency?—That is my argument, and I find that that argument was taken up, as no doubt this Committee is aware, in 1879 in a letter to the India Office, by the Treasury. I have an extract from that here. This question was discussed in 1879, and the India Office received a letter from the Treasury from which I will read this extract: "In general, the object of such Governments"—this is in reference to those Governments which have depreciated the currency in order to reduce their liabilities—"has been to diminish the amount they "have to pay to their creditors. In the present "case the object of the Indian Government appears "to be to increase the amount they have to receive "from their tax-payers. My Lords fail to see any "real difference in the character of the two trans-"actions." That is in a letter dated 24th November 1879. The proposal of the Indian Government to raise the value of the current coin of India, and thus to obtain from the ratepayers a really larger revenue, without ostensibly increasing the tax, appears to me to be open to the same objections. The injustice and the hardship are none the less real and none the less oppressive by reason of the fact that, instead of raising the amount of taxes 30 or 40 per cent., the proposal is to raise the value of the rupee to the same extent, or keep the value of the rupee high to the same extent. Such a proposal does not disguise the real increase in taxation, and does not minimise either its pressure or its arbitrariness.

10,661. Your first objection is that practically this means a general increase of taxation?—Yes, over and above the natural increase.

10,662. Then, in the next place, you object to it with especial reference to the land revenue?—Yes; the Government of India is the receiver of land revenues in India. It receives fixed revenues from landlords in Bengal, and rents from actual cultivators in most other parts of India. I assume that, when the value of the rupee is artificially raised, or artificially kept up to that point to which it has already been raised, the Government will not be disposed to make a proportionate reduction in the amount of its rents and land revenues.

10,663. But what do you say about the fall that has already taken place in the value of the rupee since these rents were fixed?—Do you mean in Madras or Bombay?

10,664. Anywhere?—In consequence of the fall of the value of the rupee, the rents have already been increased, as I explained just now.

10,665. That would not apply in the first place to the permanent settlements?—No, I am speaking of other places. Settlements are continually going on.

10,666. In individual cases?—In some parts settlements have taken place; in others, settlements are going to take place; so that, if there has been a rise in prices through the fall of the rupee, the Government has either got the advantage of it, or is going to get the advantage of it. But, by increasing the price of the rupee, you, not automatically but suddenly, raise the land revenues all over India. Take Bengal, for instance, where the revenues are permanently settled; some zemindar has engaged to pay, say, 50,000 rupees as the revenue of his zemindary, and he has paid that sum since the permanent settlements—since 1793; now the rupee is raised from 1*s.* 2*d.* to 1*s.* 4*d.*, it may possibly go higher, but it has been raised from 1*s.* 2*d.* to 1*s.* 4*d.* Therefore, in place of the 50,000 rupees which he has been paying since the permanent settlement, by raising the rupee 2*d.* you impose a real addition to the amount of revenue paid by him.

10,667. But you must go further back. When the Cornwallis settlement was made, the rupee was worth really more than 2*s.* The Government, of course, have lost by that?—In the permanent settlement tracts the Government have lost and the people have gained, and the agriculturalists have greatly benefited by that. The condition of the Bengal agriculturalist has greatly improved on account of the rise in prices, and the Government has derived advantage from the increased prosperity of the cultivators.

10,668. But do you not think the zemindars have increased their rent?—To some extent they have, but the great benefit is derived by the Government themselves, and not by the landlord. In other parts of India—leaving out those places where the revenue has been permanently settled—the land revenue has adjusted itself, or is going shortly to adjust itself, according to the rise of prices. Now, by suddenly increasing the value of the rupee, there is a further increase in land revenue. In Madras, for instance, the land revenue of a district may have been 3 lakhs of rupees; it will be 3 lakhs of rupees now, but of rupees of an enhanced value. Therefore, by this action of the Government, there is a sudden increased demand by the Government over and above the natural increase which it has received already. In order to explain this better, I have prepared this table of figures, which has been placed before every member of the Committee, which will show that in nearly every division in India there was a fall in the prices of food grains immediately after the closing of the mints, in the Punjab, in the North-West Provinces, in Bengal, in Bombay, in Madras, in Assam, and in the Central Provinces. I have compiled these figures from the book called "Prices and Wages in India," annually published by the Government of India; and I have given the reference to the pages from which I have compiled my figures. [*For this Table, see Appendix.*]

10,669. You say there has been a fall in prices since the closing of the mints?—Immediately after the closing of the mints.

10,670. (*Mr. O'Conor.*) The prices of 1892 were extraordinary high. (*Witness.*) I have taken 1893–94 together, and 1894–95 together, and I find that in every division almost there has been a fall in prices. I have taken division by division, in order to show that there is not only a fall in the different provinces, but that there is a fall in prices all over India in almost every division. I cannot myself explain that in any other way excepting by imputing it to the closing of the mints. I was in Bengal myself in 1892, 1894, and 1895 (I was absent in 1893), and the fall in prices in 1894–95 was certainly not owing to any abundant harvest, because there was scarcity in some parts of Bengal in those years, and there was scarcity in the North-West Provinces, so that naturally you would expect that prices would range high in 1894 and 1895. Instead of that, prices apparently fell in all parts of India. What I am driving at is this, that, although the prices fell, the cultivators had to pay the same amount in rupees. When they sold their wheat, say, at 13 seers for the rupee, they paid a certain rent; when prices fell to 15 or 16 or 17 seers the rupee, they got less by the sale of their wheat, but they had still to pay the same rent. In other words, it was an indirect increase in the rental all over.

10,671. (*Chairman.*) Supposing prices had risen?—The zemindars would have very soon got an increase.

10,672. But take the other parts of India, where there are no zemindars?—Then the Government would have got an increase in the next settlement. The cultivators would have got an advantage for some few years, and then the Government would have had its own share.

10,673. Sooner or later, you say, it would amount to raising the land revenue?—Yes, according to the rise in prices.

10,674. Then you say that there is another and a still graver objection to the proposal. Will you explain that?—The millions of agriculturalists and labourers in India are indebted to moneylenders and mahajans, and the debt is, in many cases, reckoned in rupees, and not in grain. To artificially enhance the value of the rupee, or to fix the value at the rate to which it has been already artificially raised, is to increase the indebtedness of the cultivators and labourers of India to moneylenders and mahajans. The measure serves to add to the profits of the prosperous classes who feed on the distresses of the poor, and to add to the weight of the millstone which the poor and indebted classes carry round their necks. Throughout the bazaars and money markets of India, the effect of raising the value of the rupee is to add to the profits of the rich moneylender, and to enhance the liabilities of the poor cultivator who has a debt. I may only add to this, that even this point was touched upon in that Treasury letter to which I referred just now. In paragraph 20 of that letter from the Treasury to the India Office, dated 24th November 1879, there is this passage:—"This relief"—that is the relief to those people who get their pay from the Government—"will be given at "the expense of the Indian taxpayer, and with the "effect of increasing every debt or fixed payment in "India, including debts due by ryots to money-"lenders." That is exactly the point I have tried to explain.

10,675. What was the state of things when that proposal was made? The then value of the rupee was 1*s.* 8*d.*, and the Government proposed, did they not, that it should be at once raised to 2*s.*?—Yes.

10,676. Is it not against that proposal that the Treasury letter is directed?—I believe that is so, and I think what we are doing now is much the same thing.

10,677. That was a distinct proposal to raise the value of the rupee, which had been for a long time, and was then, about 1*s.* 8*d.*, to 2*s.* At the present time the proposal is to prevent any further fall?—But it has been raised by the closing of the mints from 1*s.* 2*d.* to nearly 1*s.* 4*d.*, and the proposal is to keep it at that.

10,678. Assuming it to be fixed at 1*s.* 4*d.*, that would be raising it, that is what you mean?—Yes, then I was referring to paragraph 18 of the same letter, in which the Lords of the Treasury go on to say, "It alters every contract and every fixed payment in India." Virtually what it is proposed to do now would have very much the same effect. If the value of the rupee is kept at its enhanced rate by the action of the Government, it really adds to the indebtedness of the cultivator to the moneylender. The cultivator's income estimated in rupees has gone down; it went down during those two years, 1894–95, but then, of course, prices rose again during the famine years. I have not taken famine prices into consideration, but it stands to reason that, if the value of the rupee is artificially raised, the income of the cultivator, estimated in rupees, must fall, but his indebtedness to the moneylender, where it is reckoned in rupees, remains the same. Where he is indebted to the extent of 100 rupees to the moneylender, the moneylender will claim his 100 rupees, although the 100 rupees now represent a larger quantity of rice or wheat than before. Probably the whole produce of the field was 100 rupees before, now the produce of the field would not amount to 100 rupees, but the cultivator is still indebted to the extent of 100 rupees; so that, reckoned by his income, (and the income of the cultivator is in the produce of the soil) his indebtedness to the mahajan is increased all round.

10,679. You assume that prices fall as soon as the exchange value of the rupee is raised?—I assume that, because it must be so; and because our experience of those two years shows that it has been so in the past. In the years 1894–95, from the figures that I have given, it is clear that immediately after the closing of the mints the value of crops went down all over India; and it stands to reason that, if the value of the rupee is enhanced, the value of everything, estimated in rupees, must fall. When the rupee is artificially raised, the value of everything must fall. Therefore, by the sale of the produce of his field, whether it is rice or wheat, the cultivator will get, in the number of rupees, less than he got before.

10,680. What have you to say about silver hoarding?—Before leaving this, I would ask permission to say that I think it is sometimes stated that the indebtedness of the agriculturists to the moneylenders is in grain and not in money. I wish to explain that it is so in some cases, but in many cases the indebtedness is in money. In many cases that I know of, in Bengal villages, the debt is estimated in rupees, and the debt is not contracted all of a sudden. Just after the harvest, probably, the cultivator pays off his debt, and then he goes on borrowing 5 rupees or 10 rupees from time to time. When he has to marry a son or daughter, or has some domestic expense of some kind, he goes to the moneylender and gets money advanced till the harvest time comes, and then much of the debt is cleared off. But what I want to point out is that much of his indebtedness is in rupees. There is a portion of it in grain, but much of the cultivator's indebtedness, in Bengal at any rate, is in rupees. Therefore, to that extent, his indebtedness is increased by your artificially adding to the value of the rupee.

10,681. You are assuming that the debt has all been contracted at one specific period and is all going to be paid off at another?—It is annually contracted or runs on.

10,682. But, for instance, during the last 12 months the rupee has been at 1*s.* 4*d.* In 1893 it was at 1*s.* 3*d.* nearly, and in 1894 it was 1*s.* 2½*d.* Then it went down to 1*s.* 1*d.*; then it began to rise, and now it is at 1*s.* 4*d.*, you may say. But the people who contracted those debts contracted them when the rupee was worth 1*s.* 4*d.* or more, and that extends back?—But the debt is renewed from time to time.

10,683. It is renewed in rupees?—Yes, with the interest, and it is paid off also in the harvest time, if there is a bumper crop.

10,684. I want you to explain this. Supposing it is an annual loan; suppose a man raises money on his crops and pays his debt when the crops are sold, he pays and receives according to the then rate?—Yes.

10,685. The injustice would arise if the man borrowed when the rupee was worth 1*s.* and had to pay it off when the rupee was worth 1*s.* 4*d.*; but that cannot occur in one year?—The practice is not uniform. Sometimes the loan is annual, sometimes it is for two or three years.

10,686. But so far, with the exception of three or four years between 1892 and the present time, the rate was always above 1*s.* 4*d.*?—Yes.

10,687. Every liability in India, prior to 1892, was raised on the basis of more than 1*s.* 4*d.*?—Yes.

10,688. Therefore—I am assuming this for the sake of argument—fixing the rupee at 1*s.* 4*d.* would not be an injury, on your hypothesis?—For those old debts, no.

10,689. Nor would it be for those debts contracted in the last two years when the rupee was at 1*s.* 4*d.*?—I did not know it was 1*s.* 4*d.* in the last two years.

10,690. It has been steadily rising. Your argument, whether sound or unsound, would only apply to debts contracted in the three years 1894, 1895, and 1896?—Yes.

10,691. And to settlements made in those three years?—Yes, and a great portion of the settlements

Mr. R. C. Dutt, C.I.E.

30 Nov. 1898.

and debts now current among the agricultural population of India are of those years. The civil law is that, unless a debt is revived within three years, it lapses, and most of the current agricultural debts in India are of the last three years, and those debts have been virtually increased by enhancing the value of the rupee.

10,692. Now will you come to the matter of trinkets?—All that the poor people in India can possibly save in years of good harvest is saved, not in savings banks, which do not exist in India for the poor, but in silver jewellery and trinkets for their women. Practically, all the spare wealth which the cultivating and labouring classes have in India is in this form; and, in years of scarcity and famine, all this silver, or a great part of it, is sold in the affected districts in order to procure food grains. The proposal of the Government of India is virtually one to confiscate about a third of the poor man's savings in India. The value of the rupee being artificially raised, the silver bangle or bracelet in which the cultivator has invested all his savings sells for less than what it cost, and thus, by one stroke of the pen, the Government of India reduces what is really the national wealth of the poor in India, in order to meet its own liabilities on somewhat easier terms. No proposal likely to affect in a similar manner the savings of the poor could be entertained for a moment in England; and it is possible to conceive that, if such a proposal was made in a poor continental country like Italy, the masses would rise in rebellion from one end of the Peninsula to the other. The Indian Government is stronger and more absolute than the Government of Italy, and the responsibility, therefore, of saving the interests of the poor, and of taking no action injuriously affecting the savings of the poor, is all the greater.

10,693. How if the savings were hoarded in rupees?—There is very little of that.

10,694. We will not go into the quantity of it, but what is the proportion?—Of course that would increase in value, but there is very little saving in rupees in Bengal. I have been in a great many districts in Bengal, and practically all the wealth of the cultivating classes is in the silver jewellery of the women. I have been in districts that were affected by scarcity and famine. I remember that, after the great storm wave and cyclone in 1876, I was sent to a place where the cultivators had practically lost all their paddy and rice. Previous to the calamity the people in this place had been very well off, and for nine or ten months they supported themselves by buying shiploads of rice, paying for it by the proceeds of the sale of the jewellery of their women. That was in 1877. The cyclone was in 1876, and this distress was in 1877. I happened to be sent to the island which was most seriously affected by this cyclone and storm wave. On the greater part of that island the crops were totally destroyed. If such a thing had happened in other parts of India it might have been followed by a famine, but here the cultivators were very well off, and their women had a quantity of jewellery, and, as a matter of fact, they brought out these silver ornaments in order to raise money to tide over their temporary difficulty. I did not see that they brought out hoarded rupees; in fact, the hoarding of rupees is rather the exception in Bengal.

10,695. In the case of ornaments bought previous to 1893, what would be the difference between the value at the time of purchase and the value now?—They paid one rupee for a tola of silver, which is the rupee weight. They take the silver things to the bazaar, and now they get 10 annas for the tola. That is where they find the difference.

10,696. The price is regulated by the market value of silver?—The value to the cultivator when he purchased his ornaments was about 14 to 16 annas per tola. Now, for the first time, a difference is made between the price of silver and the coined silver.

10,697. No; the difference that is made is this, that you cannot take silver and have it coined?—The result is that there is a great difference between the price of silver and coined silver.

10,698. The bazaar price is what?—About 10 or 11 annas per tola. In the last 20 or 30 or 40 years, when the cultivator went into the bazaar to buy silver, he paid at the rate of 14 or 15 or 16 annas per tola. They have always made their purchases of jewellery for their women at this rate. Now, if they go to sell their silver ornaments, they get a third less. Therefore it is virtually a confiscation of a third of what they have paid for their jewellery, which, as I have explained, represents the savings of the people of India.

10,699. You say that "the proposals of the "Government of India are calculated to add to its "own liabilities." Will you explain that?—There I was referring to the rupee paper—the Government Securities, as we call them in India.

10,700. You contend that it will increase the charge for interest on those securities?—Yes, it virtually raises the value of the securities, because the rupee is raised.

10,701. You say, "the debt of the Government of India is partly in rupees, and, by adding to the value "of the rupee, you add to the debt"?—Yes. The indebtedness is mainly to moneyed classes in England, and the net result of the proposals, therefore, will be to add to the indebtedness of the people in India to the money-lenders of England. Where the Government borrowed a thousand rupees of small value, the Government now virtually tears up the old bond and executes a new one for a thousand rupees of enhanced value.

10,702. That again will only apply to the borrowing that has taken place in those three years, and the bulk of the rupee debt was contracted before. Therefore the Government gains now?—Yes, my remark applies to what took place in the last three years.

10,703. You say, "the proposals of the Indian "Government mean a general increase in the pay "and perquisites of all officials who are paid in "rupees." Will you explain that: do you draw there any distinction between the incomes that have to be remitted out of India, and the incomes that are spent in India? I will tell you why I want to ask this question. The evidence that has been given here is that inside India a rupee goes now as far as it used to go, practically; that there has been no appreciable difference made in the internal value of the rupee?—It goes further, I should say, from the prices which I have quoted here.

10,704. We have had evidence to the effect that, for all practical purposes, that is so; that is, if I have an income of 1,000 rupees a month and I have to spend that in India, that 1,000 rupees will go just about as far as it would have done 10 years ago?—Well, there has been a fall in the price of food grains, and that means an increase of pay to those who get the same number of rupees as before.

10,705. Suppose I have in India an income of 1,000 rupees per month or 12,000 rupees a year, and if I am obliged to remit 600*l.* a year to England for the maintenance of my family, then at a shilling rate I should not have much left?—I was referring only to what is spent in India. I say the proposals of the Government of India mean a general increase in the pay and perquisites of all officials who are paid in rupees. There, of course, I refer to all officials, including those who are natives of India, and who spend their pay in India. I say the poorer and indebted classes, who deserve relief at the hands of the Government, are crushed by an addition to their taxes, by an addition to their indebtedness, and by a reduction of their savings, while to the fortunate classes who are in the Government service, or who draw their pensions in rupees, the Government makes a real donation in the shape of an unearned increase to their pay and perquisites.

10,706. The gist then of this is that you regard raising the value of the rupee as adding to the national debt of the people of India and to the high price

which their foreign administration costs?—Their administration generally, because I am referring to the native employees also.

10,707. Then will you tell us how you think these proposals have an effect on the manufacturers of India?—On that point I should premise that my information is second-hand, because I am not personally engaged in manufacture or trade; but I have consulted men engaged in trade, and they tell me that the raising of the value of the rupee artificially dislocates trade, and has injured manufacture. I have heard from merchants engaged in Bombay in the cotton industry, that the cotton industry is in a miserable state just now, especially in competition with the produce from China and Japan, and they impute that, directly or indirectly, to the closing of the mints. It is well known that many of the manufactures of India have been all but ruined—within the memory of living men—by an unequal competition with the steam and machinery of Europe. I have myself, within the period of my service, visited villages of weavers almost deserted, and relapsing into jungle, manufactories of various Indian dyes, which have been closed and abandoned, and industries in metal and in leather, which are declining. It is useless to complain of this, it is useless to expect, in these days of free trade, that any sort of protection would be extended to the dying industries of India by the British Government. But it is not unreasonable to expect that the Government will refrain from taking any direct action calculated to further repress the declining Indian industries. If India had representative institutions, the representatives of the cultivators and manufacturers and exporters would have unanimously raised their voice against artificially raising the value of the rupee. In the absence of such representative institutions, the Government of India represents the interests of the people, and a moral obligation rests on the Government not to sacrifice the interests of the people to the demands of special classes, however strong and however influential. British trade is prospering with other Asiatic countries having silver currencies; why should British traders demand, in the case of India, a fixed ratio between gold and silver, which they cannot demand from other Asiatic countries? The people of India do not ask for it; the people of India will not profit by it; the people of India are likely to lose in a variety of ways, as indicated above, by the artificial raising of the value of the rupee. And the Government of India, naturally representing the people, and standing forward as the protectors of their welfare, should reject a scheme which the people do not want, and cannot profit by. What I ask is that no further impediment should be placed in the way of manufactures by the closing of the mints, and by the direct or indirect consequences arising from that. It is my opinion, derived from merchants, both in Calcutta and in Bombay, that the closing of the mints has very seriously affected the cotton industry of Bombay, the sugar industry in Bengal and in Northern India, and several other industries in India, and especially industries which are affected by the products of those countries which have silver currencies, like China.

10,708. You think it has affected the competition with China?—Yes.

10,709. Do you regard it as giving a bonus to China as against India?—That is the opinion of the merchants I have consulted.

10,710. You say, "The proposal of the Govern-" ment of India is not the natural or the proper " remedy for that increasing drain which is annually " flowing from India to England, in the shape of " pay, and pensions, and allowances"?—The allowances are paid in England in gold, and, instead of reducing its gold obligations, which is the natural and the proper remedy, the Government seeks to adopt the unnatural and desperate and dangerous remedy of converting all its revenues in India into gold. Let us suppose the case of an Indian landlord, who gets his rents from his estate in rupees and has to pay an agent in London in gold. What would courts of justice and equity think if the landlord preferred suits to realise his Indian rents in gold, on the ground that he has to pay one London agent in gold? His prudent and proper course would be to minimise his London expense, and, similarly, the natural and proper remedy for the difficulties of the Government of India would be to carry on the administration of India, as far as it is consistent with efficiency, through the instrumentality of the children of the soil, whose pay and pensions have not to be defrayed in gold. I say that an endeavour ought to be made, as far as is compatible with efficient administration, to reduce its expenditure; to have as much work done in India by the natives as possible, and, I think, with the spread of education in India, it is possible now to utilise the people of India to a larger extent than is done now under the existing rules. Under the existing rules, the higher services in all departments are recruited from England, and, therefore, from among Englishmen; not only the Indian Civil Service, which includes the Executive and Judicial services, but also the Engineering Department, the Post Office Department, the Opium Department, the Forest Department, the Medical Department, and the Education Department. In all those departments—I do not know why, but it is a fact—the higher posts are almost invariably filled by Englishmen. The result, of course, is that there is a greater drain from India to this country. When these people retire from the various services, their pensions have to be paid by India, and remitted to this country. My idea is, even from this financial point of view, it is now desirable that, education having spread in India, a greater proportion of the higher posts in the service should be allotted to the people of India.

10,711. At reduced payments?—Reduced gold payments—at reduced payments in the first instance, and also reduced gold payments.

10,712. You think, generally, that there might be a great reduction of expenditure?—Yes.

10,713. Both military and civil?—Yes.

10,714. Then you say, "the proposal of the Indian " Government withdraws the natural check which " now exists against extravagant expenditure and " unlimited borrowing in England." I do not quite follow that. First of all, you can borrow in England at a very low rate of interest?—Yes.

10,715. Is it an advantage to India to have English money spent in productive works in India?—If the Government have to borrow, it is certainly an advantage to be able to borrow at low rates; but, I say, an earnest attempt ought to be made to reduce our public debt, as has been done in England during the last 50 years.

10,716. What is the public debt of India?—The debt has gone up by 63,598,000*l.* sterling in the last 20 years.

10,717. Would you define what you mean by "the debt" of India?—I am speaking of the total debt, including railways. I will distinguish that afterwards.

10,718. But that is all important. Of course, where we have made such very large and successful efforts in this country to reduce our debt, the debt is represented, so to speak, by nothing—there is no property against that debt; it was a debt incurred for public purposes at the time, and there was no reproductive return upon it. Therefore, it is a burden upon the taxpayers of the country, and we have a sinking fund; and when we reduce the debt, as you very properly say, that is an advantage to the country. But let me put this extreme case: Suppose this country had to take over the whole railway system of Great Britain, and had to pay 1,000,000,000*l.*—which, I suppose, is a very moderate estimate—would you say that the debt of this country was increased by 1,000,000,000*l.*?—I will take the two things separately, as you desire.

10,719. If you please. I wanted to be quite clear, because my impression is that for the year 1898–99, the year we are now in, the charge for the debt

Mr. R. C. Dutt, C.I.E.

30 Nov. 1898.

proper of India is a lower figure than it has ever been since the Mutiny. I have the figures here from the parliamentary return; 15 years ago, the charge, in 1884-85, was Rx. 3,907,848. This year the interest on debt is Rx. 2,448,000?—I take the figures for the last 20 years, according to Sir Henry Waterfield's evidence before this Committee. He says, "the total increase of debt in this country within this period is 63,598,000*l.*" Against that he shows a total capital outlay on public works of 61,036,000*l.* sterling. If you take that completely away from both sides, the debt within the last 20 years, which have been years of continuous peace inside India, has not been reduced at all, according to Sir Henry Waterfield's evidence. He says, what we have spent on productive works—in which he includes, I suppose, railways, canals, and irrigation works—is more than covered by the debt that we have incurred in this country. We have spent on public works about 61 millions, we have borrowed 63½ millions. So that, if we deduct all that has been spent upon public works, and so forth, and on the other hand all that we have borrowed in England, our net indebtedness, instead of being reduced, as has been done in this country, has increased in India by 2½ millions in these 20 years.

10,720. But the fall of the rupee alone involved the Indian Government in borrowing 6,000,000*l.* sterling?—But the fall of the rupee has directly increased the revenues of the Indian Government.

10,721. Dividing the debt into the debt in India and the debt in England, the excess of assets in India (such as railways, irrigation works, loans to corporations, &c.) over the debt in India is Rx. 29,489,000. As against this, there is a balance of liabilities over assets, so far as the debt in England is concerned, of 55,675,000*l.* So that, when the Secretary of State put his Budget before the House of Commons last session, the real debt of India, which represents the Mutiny and all the military operations that have taken place in India, is the difference between the liabilities of 55,675,000*l.* in England, and the assets of Rx. 29,489,000 in India. You can hardly find a parallel to that state of things. All I want is, that you gentlemen, who influence public opinion—quite legitimately—amongst your own people, should not think that your country is as poor as it is sometimes supposed to be?—I should like to learn that from you.

10,722. The interest upon the debt of India is this year only 2½ crores?—Will you allow me to take these two things separately. I will leave out of consideration railways now, and I will say that, taking Sir Henry Waterfield's figures, there has not been any reduction in the public debt of India in the last 20 years. Those 20 years have been years of uninterrupted peace, during which there has been a great deal of reduction of the public debt of England; and, I say, there ought to have been a very considerable reduction in the public debt of India.

10,723. Do you say there has been a period of uninterrupted peace for the last 20 years?—Yes.

10,724. What do you say to the Afghan war?—That only cost 3,000,000*l.* You mean the war last year?

10,725. No, I mean the Afghan war?—That is 20 years ago.

10,726. Since 1880 the English Exchequer has voted 5,000,000*l.* towards the cost of that war?—I know. It was a war outside India.

10,727. At any rate, you cannot call it a period of uninterrupted peace?—Leaving out the expense of the Afghan war, which was a war outside India, we have made no reduction in the public debt of India, and we ought to have made a reduction. An endeavour ought to have been made during those years of peace to bring down our public debt, so that we might borrow again when it was necessary to do so. And I further say that the people of India—say one financial representative from each of the five great Provinces—ought to be consulted by the Government; they should form a committee, and some place should be found for them in the Viceroy's Executive Council, in order to advise the Viceroy and the Finance Minister in preparing every year's Budget. A systematic endeavour should be made to reduce the net public debt in every year of peace. That is my first contention. My next point is with reference to railways.

10,728. You say: "Every fresh loan contracted in "England by the Indian Government is hailed in this "country as a further opening for profitable invest-"ment; every fresh order for tools and machinery and "rails pleases great English manufacturers; every "new line opened in India is a new opportunity for "English capitalists and manufacturers." Do you not think all those things a great advantage to India?—The first lines of railway were a great advantage to India, and they would have been cheap if we had had to pay twice the amount that we have paid for them; but the new lines which are being added now, from year to year, are not so much for the benefit of the country. I remember the condition of India 20 years ago. At that time all the main lines had been opened. The new lines that have been opened since have not added much to the development of trade; they have been constructed, rather, with regard to local interests. Take one of these newly opened lines in Bengal, which connects North Behar with Assam. The great mass of the cultivators and traders of Bengal did not ask for that line, and have not, as far as my information goes, benefited by that line.

10,729. Who have found the money for that line?—I do not know.

10,730. Do you refer to the Assam-Bengal Railway?—Yes. Nobody travels that way—that is, in the natural course of trade; the trade is all between Calcutta and the northern part of Bengal. The line may be for the interest of some particular class, but we do not know why the line was laid down. We are never consulted in these things.

10,731. But is not that a matter for the people who find the money? In this country there have been railways made from nowhere to nowhere, but, after all, the loss, if there is a loss, is the loss of the people who put their money into the line?—Exactly; but in the case of India, it is the people of India who put their money into the line.

10,732. No?—We are held liable for the guaranteed profit, which comes to the same thing.

10,733. (*Sir J. Muir.*) Is there a guarantee in the case of the Bengal and Assam line?—I believe so.

(*Sir C. Crosthwaite.*) There is a guarantee, I think, in the case of the Assam-Bengal Railway.

10,734. (*Chairman.*) But the capital was all found in this country?—The capital was found; but, so far as the Government gives a guarantee, we, the people of India, are responsible for finding the guaranteed profits from our taxes.

10,735. The guarantee comes in if the traffic is not sufficient to pay?—Yes. A second instance, I would say, is the line from Assam to Chittagong. That goes over a very wild and hilly country, and I doubt if it will ever pay. It certainly has not developed, and will not develop, the trade of that part of the country, because there is hardly any produce at all in that part of the country.

10,736. *Mr. Campbell.*) Has that a guarantee?—I have no information, but I believe it has.

(*Sir C. Crosthwaite.*) It is part of the Assam-Bengal line.

10,737. (*Chairman.*) Let us assume, for the sake of your argument, that the Indian Government have not always sanctioned the best railways, as the English Parliament has not always sanctinned the best railways. We are now dealing with the development of railways throughout India by English capital. Is not that to the advantage of the people of India?—Certainly; but I say that what we are doing lately is different from the main lines that had been constructed before. By 1878 the whole of the trade of India had found proper

and legitimate outlets, and the money which has been spent since has not to the same extent developed trade.

10,738. Then how do you explain the increase in traffic, the tonnage and the passenger revenue?—That is mostly along the main routes constructed before.

10,739. The traffic must be taken as a whole. Taken as a whole, the system of Indian railways, including the railways which are not productive, shews a net return on the capital cost of about five per cent.?—But I find by the last Railway Administration Report, which I have no doubt the Committee have seen, that the total loss to the State up to that date was 57 crores of rupees, out of which about one-half, 28½ crores, had been lost in the last 20 years. I do not condemn railways; we wanted railways to develop India, and we must pay for them, even if it is a losing concern; but what I object to is the unlimited extension of railways at an increasing charge to the taxpayer, after all the main lines have been opened out.

10,740. What do you mean by unlimited extension?—I mean what is going on now.

10,741. But there is no unlimited extension. Government sanction has to be obtained?—No doubt there is the engineer's report and the Government inspector's report, and all the rest of it, but what I object to is that the people themselves are not consulted.

10,742. I do not want you to think that these railways in India are sanctioned without considerable caution—indeed, I think a great excess of caution. I believe that the interests of India would be much better met if the Government gave a freer hand in the construction of public works; and, if English capital goes out there at a low rate of interest, I do not think India has any ground of complaint?—But all this is adding to our indebtedness, and it is a losing concern, according to your own showing—according to the last report published for the year 1897–98. We have lost 57 crores of rupees, and, of that, 28½ crores have been lost within the last 20 years. We should not abandon the railway system altogether, but we should be cautious, and I think the representatives of the people should be consulted before any new lines are sanctioned. There is a railway now under consideration from Mandalay up towards China. Well, it will probably be years and years before that will pay, and at the same time we have either to pay for the construction of it, or to guarantee some profit to the capitalists out of our taxes. These are matters in which, I say, we ought to be consulted. The whole thing is being overdone—to the advantage of the capitalists and manufacturers of this country, and to the loss and disadvantage of the people of India, who are not consulted. That is my contention.

10,743. Now is there any other point that you want to bring forward? You say, "the only check "which now exists is that the interest of the capital "so borrowed has to be paid in gold." In some cases it is the fact, is it not, that the interest on the capital is paid in rupees?—Yes, if you wish to borrow; but the point I wish to make is this: that an attempt ought to be made to reduce our expenditure.

10,744. That is really not before this Committee. We have to consider the question here, whether it is desirable to introduce a gold standard and gold currency into India, and whether it is desirable to have a stable rate of exchange?—What I have said would come directly under that, because the necessity for adopting a gold standard, or for giving a gold value to the rupee, would disappear to a great extent, if the expenditure were so reduced as to make our income meet our expenditure. The loss of which the Indian Government complains would not exist if more economy were practised, and the expenditure of India were reduced.

10,745. Have you considered that, if no step was taken, and the rupee went to its bullion value, and assuming that silver went no lower, you would require at the present rate of expenditure in India something like an increased income of 12 crores?—I have heard that stated. I find, in the first place, that a great portion of that 12 crores could be knocked off by a little economy.

10,746. You think that, by economical arrangement, the 12 crores could be saved?—A considerable portion of it; and the remaining portion could be met by the natural increase of revenue which the very fall of the rupee would give rise to, as I have explained.

10,747. Then, taking your opinion as a whole, you would face that emergency and let the rupee go to bullion price?—Yes. I would have no hesitation whatever about that, because I am convinced that the revenues estimated in rupees would rise, as they have risen in the past, with the fall of the rupee; and, secondly, that a good deal of saving could be effected if we practised economy in India.

10,748. For all those reasons that you have very clearly put before us, you are opposed to the proposals of the Government of India?—I am strongly opposed to them.

10,749. Do you upon this question represent the views of the Indian National Congress?—No, I do not belong either to the Indian National Congress or to its British Committee.

10,750. But you do represent a mass of native opinion that you feel justified in bringing before us?—Yes.

10,751. (*Sir F. Mowatt.*) You have impressed upon the Committee the great importance of reducing the debt of India. In connection with that, I think you said that the whole system of railways taken together is a losing concern?—According to the figures that I have quoted.

10,752. You contended that that were to a considerable extent owing to the fall of exchange?—So I am informed.

10,753. If, therefore, the exchange was to fall further from 1*s.* 4*d.* to 10*d.* it would become a much more losing business?—I think so, unless there is a development in trade.

10,754. And it would be necessary to charge upon the Indian taxpayer a great deal more in order to meet that?—I would not charge the Indian taxpayer more; I would raise the railway fares, in proportion to the fall of the rupee; that is the natural remedy for it.

10,755. You think that the immediate raising of the fares would increase the receipts from the railways?—I think so, if it is in correspondence with the fall of the rupee.

10,756. Are you aware that attempts have been made, so I am informed, to raise the rates of traffic?—I have not heard of it. I am not aware of any such efforts having been made either in Bengal or in Northern India.

10,757. And that would, of course, not affect those lines on which you say from the very essence of the line there is no real traffic?—No, that would not be affected.

10,758. The larger part of the railways made in the last 20 years come under that definition?—That is my impression.

10,759. As regards the whole of them, the increase in fares which you suggest would not help?—It would, because most of our income comes from the older lines.

10,760. But take the expenditure on these lines which do not pay, and never can pay. The increase of fares there would not help you?—Not in regard to these lines.

10,761. Then you have said that the proposals of the Indian Government, including the closing of the mints and the gold standard, practically amount to an increase of taxation?—Yes.

10,762. That increase of taxation is required to enable the Government to meet its external debt. That is the contention, I suppose?—Yes.

Mr. R. C. Dutt, C.I.E.

30 Nov. 1898.

10,763. If those alterations are not carried out, and if the rupee falls down to 10*d.* or 11*d.*, you would admit that the need would be all the greater for the Government of India to find a surplus income to meet its external debt?—Yes, it will have to economise.

10,764. Whatever the ultimate effect of the rebound in trade from the fall of exchange might be, the immediate effect would be that the Government would not be able to meet its external debt, at all events for some years?—For a few years.

10,765. And to meet that, I understand you to say, it should be prepared to borrow?—Yes, for those few years.

10,766. That borrowing, as far as it goes, would increase the debt of course?—Temporarily.

10,767. And your case is that you look forward to some eventual development of trade which will enable the country to supply the Government with a sufficiency of revenue?—The development of trade and the development of revenue from all departments which will result from the fall of the rupee, as I have explained; also reduction of expenditure.

10,768. As regards reduction of expenditure, you are aware that the officers of the Government who have been before us, have not seen their way to any large reduction of expenditure?—I have read portions only of their evidence.

10,769. In talking of a possible reduction of expenditure, you merely suggest that on general principles it is advisable to reduce it, if possible. With the exception of the employment of the Indian officials at a cheaper rate, you have not suggested any way of effecting that reduction?—I have suggested another thing, namely, that the Viceroy's Council ought to consult representatives from each province formed into a committee in framing the annual budget, and I have no doubt the representatives of the people would be able to suggest things to the Finance Minister which would be valuable—not that we are better informed than the Finance Minister—but things do strike us from our point of view which do not strike the Finance Minister. In that way a good deal of reduction might be effected without making administration less efficient.

10,770. I understand you to mean there is not sufficient communication between the governors of provinces and those who advise his Excellency, to enable him to know what are the views of the people?—There is not sufficient communication between the people and his Excellency's financial advisers.

10,771. (*Sir J. Muir.*) The evidence that you have just given has struck me as very important. Could we obtain evidence from others of the natives of India? We have had difficulty in getting at information from the natives of India. It appears to me most desirable that we should have that evidence. Can you suggest any way whereby we could get evidence from intelligent natives of India, men whose evidence would be of value to us and who stand well in their respective communities?—There are very few here, because most of the natives of India in this country are young students, and they have not thought over these matters; but I have no doubt that, if this Committee decided to have the evidence of responsible experienced Indians, they could get them here in the course of two months. There would be a great many people willing to come here, if this Committee desire to get their evidence.

10,772. For example, could we get evidence of men of something like similar experience to your own?—I do not know of any other retired Indian official in this country.

10,773. But I mean, are there others in India whom we can bring over here?—Oh! yes; I think we could get a good many, if you expressed a desire to hear them. I have no doubt the Government of India would be able to send a good many men experienced in administration who would represent also the educated opinion of India.

10,774. Is it the case that there is a feeling prevailing to some extent in India that we are not having sufficient evidence from India itself?—I believe there is such a feeling, so far as I can judge from Indian papers.

10,775. And, in your opinion, it would be desirable that we should take steps to remove that feeling?—It would be very desirable, and also to look at things from our point of view; because the difficulty in deciding Indian questions is not that you have not able men here, but you never see two sides of the question; you always see the official side of the question, and never the other. Therefore, I believe the Indian Government occasionally makes blunders which have a very bad effect in India.

10,776. Is it the feeling in certain quarters in India that too many officials of the Government of India have been asked to give evidence, and too few natives of India?—There is such a feeling; in fact, the feeling is that nearly all the evidence before this Committee, outside that of European merchants, is the evidence of Government officials who have expressed their support of the Government views.

10,777. And is it the feeling that that is injurious to the Government of India's being held in proper respect by the natiues of India?—It is injurious to the interests of the people of India, because the people of India think that they have their own interests, which they can represent, and are willing to represent, and which are not represented before this Committee.

10,778. How should we set about getting this evidence from really good representative men in India — natives of India, but really representative men? Intelligent information is what we want?—There are many distinguished and well known men, and the Government of India, if asked, could certainly select some of them, who have had experience in administration, and who at the same time represent the people of India.

10,779. Could you mention any names?—Yes, I could mention them to-morrow if necessary, or I could to-day, if you like, mention some names.

10,780. Perhaps you might suggest some names now, and you could supplement your list afterwards?—There is Mr. Rojoni Nath Roy; he is a man who has more experience of financial matters than I have, and he is also a thoughtful and well-informed man.

10,781. And in your opinion, would his evidence be valuable to the Committee?—It would.

10,782. Is he a Hindu?—He is a Hindu.

10,783. And would be willing to come here?—Yes. He is a Brahmo gentleman, and he would be willing to come.

10,784. Can you mention any other name?—Mr. Siraj-ul Islam was a member of the Bengal Council at the time I was a member. He is a representative Mohammedan gentleman, highly respected, and very intelligent.

10,785. He would be willing to come?—Yes; he is a Mohammedan gentleman; he can have no objection. Then I would suggest Mr. B. L. Gupta, who was lately acting as High Court Judge, and who would also represent the opinions and feelings of his educated countrymen.

10,786. How long has he held that position?—He and I entered the civil service in the same year. He was acting as High Court Judge for a few months, and he is now, I think, the Legal Remembrancer of Bengal.

10,787. I regard this as very important, because, as I have said, we have had some difficulty in getting the names of men who would come before us, and whose views would carry weight in India. Then are there any others?—I am trying to think of men who have served under the Government, because they have the advantage of some official experience, which goes a long way in the consideration of these questions.

10,788. (*Sir F. Mowatt.*) Do you say you would prefer men who have had experience under Government?—Other things being equal.

10,789. (*Sir J. Muir.*) Are there any other names you can mention?—There is Mr. Sita Nath Roy,

the President of the National Chamber of Commerce in Bengal. He has great experience and can give valuable evidence with regard to trade questions from the Indian point of view. Then there is Mr. A. M. Bose, who was in this country last year. He has shares in some tea gardens, and also he is a barrister and a representative man; he could give valuable evidence.

10,790. Are there any native planters of indigo that we could have?—I cannot think of the name of any just now, but Mr. A. M. Bose would give you a great deal of information about tea; he has shares in some tea plantations, and has a great deal of experience in that business.

10,791. You said that the action of the Government of India in raising the rupee practically from 1*s.* 2*d.* to 1*s.* 4*d.* was very heavily against the cotton industry in Bombay and against the sugar cultivation?—That is my information.

10,792. Is it the case that sugar cultivation is rapidly declining all over India?—So I have heard. In Northern India and in Bengal it has declined very much.

10,793. And the advance of 2*d.* in the rupee is blamed to a certain extent for that decrease?—To some extent, yes.

10,794. How does this advance from 1*s.* 2*d.* to 1*s.* 4*d.* affect the cotton mills in Bombay?—I could not explain how it does, because my information, as I said before, is from the merchants. They say that the way the industry is affected is by giving a sort of bonus to the silver countries; that China and other silver countries have an exceptional advantage as compared with India since the closing of the mints in India.

10,795. That affects China specially?—China and other silver countries.

10,796. Of course, China comes into direct competition with the Bombay mills?—Yes.

10,797. Then is it your opinion that money has been expended in the making of railways not specially for the benefit of the people of India, but for Government purposes?—Or in the interests of special sections—not for the interests of the people generally.

10,798. (*Sir F. Mowatt.*) By "special sections" do you mean special districts or special classes of people?—Special districts, or it may be special classes, but not for the people generally.

10,799. (*Sir J. Muir.*) I happen to know somethink of the Assam-Bengal Railway to which you have referred. What is the feeling in India among Indian natives regarding that railway?—The feeling in Bengal is that it was not needed in the interests of the people generally. It was not needed in the interests of trade generally, because all the trade comes down towards Calcutta, and the native manufacturers and producers did not want it and did not ask for it. Of course, every railway is an advantage to some extent; but whether the advantage of this line to the community generally was sufficient to justify the expenditure is a question on which the people have grave doubts.

10,800. Is it the fact that a large portion of that line goes through dense jungle?—I believe that is the fact, through the Dooars.

10,801. So that, if it is said to be made for the benefit of the tea industry, you would consider that incorrect?—I do not know all the facts about it. The impression in Bengal is, that it was not for the advantage of the general trade of the province.

10,802. You spent a good deal of your time in Bengal, did you not?—Nearly all my time.

10,803. Are you aware that there is a magnificent service of steamers by the Brahmaputra route up to the far east of Assam?—Yes.

10,804. So that, so far as the Assam planters were concerned, the railway was not needed?—I believe it was not needed for them, unless they wanted to make carriage of coolies cheaper. From Behar the coolies now have to be taken to Calcutta, and then take the steamer, whereas this line would take them direct to the north of Assam.

10,805. Is railway carriage cheaper than river carriage?—But the river transport costs a lot of money. Suppose a planter is taking up to his garden two or three hundred coolies, it is not only the steamship fares that he pays, but he has to feed and shelter the coolies. He takes them to Calcutta where they stay a day or two, then to Goalundo where there is, perhaps, another halt, and then on board the steamer. It is possible that all that may be saved by this new line, but, as I said before, I cannot speak of that from my own information.

10,806. Then, a question was put to you as to the possibility of the rupee falling to 6*d.*?—I do not believe that is possible, myself.

10,807. You would be inclined to think that a *reductio ad absurdum*?—Yes.

10,808. (*Chairman.*) Why?—I do not think the rupee could be produced for 6*d.*

10,809. Where do you think the line is drawn? It is now produced to pay at a little over 9*d.*?—That is about as low as it can possibly go.

10,810. Why?—Because, as I have said, I do not think it can be produced at less, to pay.

10,811. (*Sir C. Crosthwaite.*) Have you any knowledge of silver mining?—No.

10,812. (*Sir J. Muir.*) Can it be produced to sell at 9*d.*?—I have been told so, but my information on that point is not worth very much; it is only second-hand information.

10,813. Is it not the case that a very large number of silver mines in America and Mexico would have to be closed down, if it came to anything like that?—That is what I have heard.

10,814. So that the rate would immediately start up from 9*d.*?—That is what I have heard said.

10,815. Suppose the mints were opened now, what effect would that have on the price of silver?—The value of things would go down a little immediately, corresponding to that difference of 2*d.*

10,816. The rupee, you mean, would go down?—Yes.

10,817. But what would be the effect on the price of silver in the London market?—That I cannot say. I would not take it upon myself to say that, because I cannot claim to be an expert. In connection with this I may mention one thing, that this distinction between the market value of silver and the value of the rupee is also liable to give rise to a great deal of false coinage in India. When I was in Orissa, only three years ago, there were forged coins brought from different native states. It was only detected because the silver was debased. But, when you make a difference of something like 5*d.* between the coined and uncoined silver of the same weight, the chances are that a great deal more of this false coinage will take place, and it will be impossible to detect it, because it will pay to make it of good metal. One-third of India consists of native states, and we have no sufficient control over the doings of the people in those native states.

10,818. Then, did we understand you to say that, in your opinion, the action of the Government of India means practically the confiscation of one third part of the savings of the poor of India?—About one third, because, as I said before, the tola of silver as jewellery used to sell at about 14 annas to 16 annas, and now it does not fetch more than 10 or 11 annas per tola.

10,819. Then, in your opinion, when the people of India, especially the poorer classes, come to realise that fact, what effect will it have upon them?—There will be very great dissatisfaction in the country, and they will know, and they will think, and they will be told, that the Government has done some sort of *jadoo* or magic with the currency, so as to depreciate the value of their silver ornaments and to depreciate the value of their field crops.

10,820. In your opinion, do you think the Government of India, by in an arbitrary manner forcing up the rate to 1*s.* 4*d.*, are playing into the hands of those men who are desirous of spreading disaffection throughout India?—Yes; if there be such men, and I

Mr. R. C. Dutt, C.I.E.

30 Nov. 1898.

have no doubt there are, they will be going up and down the country saying, "This Government has "taken away one-third of the value of your silver."

10,821. I should like to get the evidence of some independent Parsees. You are aware that in Bombay the Parsees are amongst the most intelligent of the people. Do you know any intelligent Parsee whom we could get here to give evidence?—I do not know of any here, but Mr. R. D. Mehta of Calcutta is a representative Parsee. Then there is also Mr. Perojsha Mehta of Bombay.

10,822. I should like, if it could be managed, to get a mill-owner of Bombay?—I will send names to the secretary.

10,823. Give us the names of two or three good mill-owners, men of means, who have made a position for themselves in Bombay?—Very well.

10,824. (*Sir A. Dent.*) I merely want to ask you about the ornaments. When a native has to buy ornaments, are they paid for in rupees or in uncoined silver?—Generally in rupees.

10,825. What does it cost on the average to have the rupees converted into ornaments?—The ornament weighing a rupee costs a little over a rupee. A man pays rupees to the goldsmith; the goldsmith gets the bullion, and makes it into an ornament and gives it to the man; the man examines it and sees that it is good silver, pays the goldsmith's wages, and there the transaction ends.

10,826. So that, if he bought his bullion at 10 rupees, when it is converted into ornaments, it costs him 20 rupees?—Oh, no, the goldsmith's charge for making is very small; it is about one anna in the tola. If the silver is worth 10 rupees, the made ornament would cost less than 11 rupees.

10,827. If he has had his ornament made out of bullion silver, he has lost nothing at all, because, when he sells his ornament, he gets back just the same amount of silver as he did before?—He did before the closing of the mints.

10,828. Therefore he is not damaged?—He is damaged in this way. Before the closing of the mints, the ornament cost him 16 annas per tola of silver. Now, if he goes to the bazaar and sells it, he only gets 10 annas per tola of silver.

10,829. I quite understand your argument if he melted his rupees, but I do not see how the exchange comes in, if he takes silver bullion to be made into ornaments?—I think I can explain it in this way: When he made an ornament he bought a rupee's weight of silver for the rupee. It does not matter where he bought it from, but he paid the goldsmith one rupee for one rupee's weight of silver, and the ornament, weighing 10 tolas, cost him 10 rupees, plus the making of the ornament. Now he takes the same ornament into the bazaar, and, whether he sells it as ornament or as silver, he gets only a little over half that money, on account of the difference between the value of coined silver and uncoined silver, due to the closing of the mints.

10,830. I do not admit that the coined silver comes into the question at all; he has lost merely the difference in the price of silver. I do not see where the exchange comes in?—The exchange comes in in this way: If there had not been a difference between coined silver and uncoined silver, the rupee would have gone down with the silver, and gone up with the silver; there would have been a complete correspondence between the value of the rupee, and the value of the uncoined silver. Now you disturb that correspondence. Formerly, a man paid his rupee, and got the rupee's weight in ornaments, whether the rupee was up or down. Now, for the first time, you have made a difference between the value of coined silver and the value of uncoined silver; and therefore, when he takes this thing to the bazaar, he does not get the same amount in coined silver, that is to say, in rupees. That is where the difference comes in, and that means a confiscation of the savings of the nation to the extent of a third of their value.

10,831. (*Mr. Campbell.*) You are in favour of the re-opening of the mints?—I am in favour of the re-opening of the mints.

10,832. Do you object to the gold standard altogether?—I object to the gold standard as applied to India.

10,833. Do you object to the gold standard altogether, or is it merely that you object to the rate at which the ratio between gold and silver is fixed?—I absolutely object to the gold standard for India.

10,834. Do you think that a gold standard or a gold currency would be unsuited to India?—I believe it would be unsuited to India.

10,835. Would it have no advantages in the way of creating a stable exchange?—I do not know if it will be of any advantage to the trading classes, but, from what I have heard from the manufacturing classes in India, they do not want it, and the great population of India, the great producing and cultivating population (and about four-fifths of the population of India directly, or indirectly, are agricultural) do not want it, and a gold standard would injure them, and not benefit them.

10,836. You are aware that it is not so very long ago since India had a gold currency?—I do not know when it was. Under the Mahommedan emperors the mohur was coined, but the usual currency was always silver.

10,837. Gold was legal tender up to 1853?—And silver also.

10,838. It was chiefly confined, I think, to Southern India, but there was a very large gold circulation in Southern India at the beginning of the century, and the general impression was that it was rather a favourite currency?—Was the silver valued according to its gold value, or as silver?

10,839. There was a rate of exchange between the two?—A fixed rate of exchange between the two?

10,840. Yes?—Well, I am not aware of the history of that, but silver was always the usual currency.

10,841. Now as regards the silver ornaments, does much realising of these silver ornaments go on?—A great deal. In every year of scarcity there is a good deal of sale of these silver ornaments, and in the years of bumper crops and good harvests there is a good deal of making of these silver ornaments.

10,842. Is that confined to years of scarcity?—Well, every third or fourth year the rice partially fails—I am not speaking of years of famine, but there are every now and again years of partial distress, and some of the people have to part with their silver things.

10,843. If a man invests so much money in buying silver ornaments for his wife, he does not want to part with them, and as a rule he does not; it is only stress of necessity that will induce him to part with them?—Certainly.

10,844. Taking the country as a whole, does that stress of necessity arise very frequently?—Yes, taking the agricultural population, and taking the lower strata of the agricultural population, there is a bad year after every few good years, and then there is a great sale of these ornaments.

10,845. Taking the last three years, the population of India have been able to buy their silver ornaments very much cheaper?—They bought very little, if anything at all, because these last four or five years have been years of scarcity and distress.

10,846. The imports of silver into India are about as large as they have ever been, even before the mints were closed?—Much of that has been consumed by the richer classes, not the agricultural classes.

10,847. But for whatever purposes it was required, whether for silver ornaments or for any other purpose, the fact remains that they were able to buy silver at about 30 or 40 per cent. cheaper than they could before?—Those that did buy it, yes.

10,848. Is not that a considerable set-off to the fact that the few who required to realise silver were not able to get so much for it as they did before?—I do not see how it could be a set-off at all, if the value

of silver has gone down. The silver bangle, for instance, is not valued simply for the beauty of the thing; probably a glass bangle would be prettier; it is valued because it is worth so much in the market, and, if that price has gone down, the thing depreciates in the eyes of the owner.

10,849. But the owner may buy another one afterwards?—It is of less value to him. If it went down to the value of brass, for instance, he would throw it away.

10,850. But he can replace it at the same price as he gave for the other one?—He can replace it, but it is not of the same value to him.

10,851. You speak of the extent to which the Indian debt is held by Europeans; and you consider that an unfortunate circumstance for India?—Yes.

10,852. But do you not think that the natives of India are themselves very much to blame for that fact?—You cannot blame them for their poverty. Most people who can save have saved in Government securities in India.

10,853. During the last 40 or 50 years, every year has taken out to India millions and millions of gold and silver, the great bulk of which has disappeared altogether in hoards and so forth. Would it not have been an immense advantage to India if that gold and silver had been employed in building India's railways and making India's canals, and industrial works of that kind, instead of being buried in the earth?—There must be some margin of saving for the people, and this silver which has gone there represents that margin of saving. If you divide that silver by the population of the country, it comes to about 6*d.* per head of the population for the year, and that only represents the wear and tear of the silver already existing in the country. I do not think it represents any addition to the quantities of silver in the country.

10,854. But there are hoards of gold as well?—Gold, of course, is only for the rich classes. I do not know how much of this gold goes to India only to go out again.

10,855. (*Chairman.*) Mr. Campbell means on balance?—The Chinese and Japanese and others come to India to make purchases, and, of course, the gold goes out of India with them as their personal property. I do not know whether that has been taken into account. I do not think you can ever know how much goes out in this way.

10,856. (*Mr. Campbell.*) Instead of all that lying useless, would not the country have been benefited, and been much less indebted to foreign creditors, if that money had been employed as I say, instead of being allowed to lie idle?—I do not think it lies idle, because it serves the purpose both of ornaments and savings bank. The only ornament they indulge in in India is these cheap silver things.

10,857. As regards the savings banks, is it not very much more economical and better to put your savings into some interest-bearing security than to tie them up in a bag?—The ornament does not produce interest, but, on the other hand, the money is more quickly expended. If an Indian cultivator had 200 or 300 rupees in the bank, it would disappear in the course of a year or so; but, if it is in the shape of his women's ornaments, he will keep them until he is compelled by famine to part with them. You must take into consideration the customs of the country in considering all these questions. Silver ornaments are a safer and more lasting investment for the Indian than deposits in banks.

10,858. Do you not think that it would be doing the people of India an immense service, if they could be induced to employ their savings in profitable investments, instead of in the senseless hoarding which goes on now?—I do not think it is senseless hoarding. I do not think there is more hoarding in India than is practised by every people on the face of the globe. I do not think that the people of India spend more upon their anklets and bracelets, and so on, than European women spend on silks and finery, which are of less value to them in times of distress.

10,859. (*Sir C. Crosthwaite.*) You consider that the closing of the mints has raised the value of the rupee, do you not?—Yes.

10,860. How is that evidenced?—From these figures that I have put in.

10,861. By the prices?—Yes.

10,862. By a fall in prices?—Yes.

10,863. That is to say, the rupee buys more now than it did?—Yes, more of food grains and more of silver.

10,864. It buys more of other things, including silver, than it did before?—Yes.

10,865. Now, you admit that, if the hoarding had taken place in rupees, the people who hoarded before the closing of the mints gained?—Yes.

10,866. That is to say, each rupee that a man possessed bought more?—Yes.

10,867. Suppose he had hoarded in silver, he sells the silver for less rupees?—Yes.

10,868. Then you say he loses?—Yes.

10,869. Should you consider that a great injustice?—Yes.

10,870. But is not each rupee that he gets in exchange for his silver so much more valuable? Suppose he had saved 5 rupees in rupees. After the closing of the mints his rupees were worth, say, 1 rupee 4 annas; suppose he had saved his 5 rupees in wheat, or silver in ornaments, and he sells that, the rupees he gets for it will also be worth more than they were before?—That would be so with regard to food grains, but not with regard to import products,—the Lancashire cloth that he wears, and so on. It would be worth more with regard to food grains, but not with regard to other things that he requires.

10,871. Therefore, with regard to his food, he would be as well off as he was before?—Yes, the value of the rupee that he gets being so much more.

10,872. The value of the rupee being so much more, although he got so many less rupees, he would be able to buy the same amount of food?—Yes.

10,873. When do the people come in and sell their ornaments?—In years of distress and bad harvests.

10,874. They sell in order to get food?—Yes.

10,875. Therefore, as respects the purchase of food, no loss was sustained by people who sold their ornaments?—No; if prices have gone down to the same extent.

10,876. That is the theory?—Yes.

10,877. And, on the other hand, the man who saved rupees benefited?—Yes.

10,878. We have no information as to the proportion of the savings in rupees to the savings in ornaments?—I can give you a very fair idea. In most of the Bengal hoards you will find the savings in ornaments, and none in rupees.

10,879. On what evidence is that based?—I have been in all sorts of villages.

10,880. So have I. I have spent a great deal of time in Indian villages?—In Bengal villages?

10,881. No; but in the places where I have served. I could not say whether the savings of the people were in rupees?—But I can; I saw them brought out. In years of bad harvests I went to the famine-stricken districts, and I actually saw the ornaments. I only heard of one instance of rupees being brought out in the same way. That was a case in which an old woman died, and a hoard of rupees was found buried in the floor of the room. That is the only instance I can remember of a hoard of rupees being found.

10,882. Can you tell me what was the value of the ornaments that were taken to the mint during the famine of 1877–78?—They sold for a little less than the rupee.

10,883. How many rupees' worth of ornaments were sent to the mint at that time?—I do not know how many went to the mint, because these things were not sent by the cultivators to the mint, they were sold in the bazaars to traders.

Mr. R. C Dutt, C.I.E.

30 Nov. 1898.

10,884. But still, they would go to the mints?—I cannot say how much went to the mint.

10,885. Have you ever been engaged in settling the land revenue?—Oh, yes.

10,886. Will you tell me where you have been engaged in settling the land revenue?—Orissa was my last station, and the settlements in Orissa were going on under my supervision in 1896.

10,887. Did you take prices into consideration?—No. We found what the Zemindar had already taken from the ryot, and based the settlement upon that.

10,888. You refer to the matter of settling the rent-roll of estates?—Yes.

10,889. And whatever rent-roll you found, you accepted that?—Yes, generally.

10,890. Having tested the rent-roll and found it accurate, you accepted that?—Yes, generally. Some rough classification of lands was made, but, roughly speaking, we accepted the total rental as we found it in each estate.

10,891. But have you actually settled what revenue a man should pay on the falling in of a settlement; have you done that?—No, I do not think I have ever done that.

10,892. I think I heard you say that, since the closing of the mints in 1893, a great many settlements had fallen in all over India?—Settlements are constantly falling in.

10,893. That is a vague statement. Do you make that statement after having examined the records of each province, and seen what settlements have fallen in?—There were the Orissa settlements which went on under my own eyes in 1895–96; then, as I learn from Sir Antony MacDonnell's evidence, there are the North-Western Settlements and the Oudh Settlements going on now. Then there were the Central Provinces settlements; they have been completed after 1893.

10,894. Some of them?—Some are going on still.

10,895. I want to ask you now whether you think that in making those settlements the prices of produce since the closing of the mints had any influence on the rents which were made the basis of the land revenue?—I suppose, to some extent. Generally, of course, the effect would appear after a number of years, and, therefore, this must have affected it to a small extent.

10,896. It could have affected it very little?—But to some extent

10,897 If it affected it at all?—To some extent it affected it, I should think.

10,898. You do not know, of your own knowledge, that it affected it at all?—No, of course not.

10,899. So far as prices were taken into account, the prices over a long series of years would be considered?—The whole thing depends upon how far the Zemindar has taken advantage of the variation in prices.

10,900. I am not talking of the Zemindar. I am talking of the Government revenue?—In the North-Western Provinces, in the Central Provinces, and in Orissa, we go on what the Zemindars get.

10,901. I do not know the practice in Orissa, but in the North-Western Provinces, and the Central Provinces, the rents are carefully examined, and all exceptionally high rents are excluded?—Yes.

10,902. And rack rents are carefully excluded from the settlement?—Yes.

10,903. That being the case, do you think that a fall in prices during the last year or two would have a material effect?—Not very much, I should think.

10,904. Then, if the contracts between the Government and the landlord with regard to the land revenue were made on the basis of prices which were not affected by the closing of the mints, your contention as to any breach of faith on the part of the Government would, so far, fall to the ground, would it not?—I do not think so. The rents were fixed in view of the high prices which prevailed before the closing of the mints. The same rents are demanded after a fall in prices subsequent to the closing of the mints. This is a virtual increase of rental, and therefore breach of faith.

10,905. And the fall of prices in every succeeding year will, of course, be taken into consideration in making the assessment?—Within my experience, there is no reduction in the land revenue in an entire estate or district in the settlements made.

10,906. Do you know of no settlement in which there have been reductions of revenue?—No, not over an entire estate.

10,907. The value of that assertion is modified by the fact that you have never been engaged in making assessments?—Except in Orissa in the way I have explained.

10,908. Is it not the case that no settlement of a district or a province is ever made without reductions in some cases, and rises in other cases?—That may be your experience. I am speaking only of cases that have come within my observation, and every settlement made has shown a net increase in revenue.

10,909. You do not assert that as regards the whole of the settlements?—No, I confine it to cases that came within my observation.

10,910. Then, with regard to the settlement in Bengal and in permanently settled districts, do you think there is nothing to be said on behalf of the Government? You say, to do anything to raise the value of the rupee is, more or less, a breach of faith on the part of the Government; but is nothing to be said on behalf of the Government for their right to keep the rupee at the same value as it had when the settlement was made?—You cannot do that without affecting other parts of India; that is the worst of it.

10,911. I do not say anything about other parts, but, as an abstract question of justice, is there any injustice involved? I admit that, if the rupee were raised above the value which it had at the time the contract was made, there may be something to be said about the injustice of it; but suppose the rupee is merely maintained at the value, or even at less than the value, that it had when the contract was made, is there any injustice in it?—I do not think that, considering the variations of the rupee during the whole period from the date of the permanent settlement, the Bengal Zemindars have any reason to complain of injustice.

10,912. Now, as to questions of taxation. You seem to think that, owing to the fall in the rupee, the Government automatically, as it were, gets an increase of taxation?—Yes, an increase of revenues in all departments.

10,913. In regard to land revenue, you think it gets that when the settlement falls in?—Yes.

10,914. And, if the alteration in prices is taken into consideration, as it would be, and any rise in the rents which had occurred, owing to the fall in the value of the rupee, were taken into consideration, then the Government would get a certain amount in that way?—Yes.

10,915. Now, as to the income tax?—In the same way.

10,916. I cannot understand how it comes out in that way in regard to income tax. The mass of the income tax in India is collected from the officials?—No, the traders pay as well.

10,917. The officials pay income tax?—Oh, yes; they pay a share.

10,918. How does the Government get any increase of income tax from its officials?—It cannot in the case of officials.

10,919. Then in the case of the trader?—If the trader's real income remains the same, his income in rupees must increase; the rupees have depreciated, and so the income tax paid in rupees increases.

10,920. His real income remains the same, you say?—His real income remains the same.

10,921. How is the income tax taken?—In rupees.

10,922. It is a percentage of the income?—Yes.

10,923. Then, if the trader's income remains the same, Government will get the same income tax from

him which it got before?—If his real income remains the same, his income as estimated by the depreciated rupee must increase.

10,924. I do not know what you imply by the term "real income." The income tax is assessed on the man's rupee income?—Yes.

10,925. If he makes an income of one thousand rupees, he pays so much; if his income is two thousand rupees, he pays so much?—Yes.

10,926. Then how can you say that the income tax increases while the income on which it is levied remains the same?—His real income.

10,927. What does "real income" mean?—I mean his income as estimated by the produce of the soil. If rice goes up, and he deals in rice, his income in rupees must increase.

10,928. Your supposition is that he is a trader whose income has remained the same?—In rice.

10,929. You did not say it remained the same in rice?—I said his real income.

10,930. I do not understand a trader whose income is in rice?—I have seen every day of my life large quantities of rice bought by native traders to be sold at a profit.

10,931. Te be sold for what?—For rupees. If the trader bought 12,000 maunds of rice every year and sold them in the bazaar, when the rice was only 1 rupee per maund his profit was 2 pice per maund; when the rice goes up to 2 rupees per maund, his profit will go up to 4 pice per maund; therefore, his income, as represented by rupees, must increase.

10,932. And he will be assessed on that?—He will be assessed on that.

10,933. The rupees are not worth so much as they were before?—No.

10,934. But the Government gets more rupees if his money income has increased?—That is it.

10,935. Now, suppose you close the mints and the rupee falls in value, does the Government continue to assess him in that way?—If you close the mints, the rupee rises in value.

10,936. Then does the Government continue to assess the taxpayer in the same way?—On whatever his income at that time is.

10,937. His income is taken on the income of the year—on his own returns?—Yes.

10,938. Then where is the injustice?—I did not say it was an injustice to the income-tax payer. What I said was this, that by the depreciation of the rupee the Government would get an increase in a natural way from the income-tax payer.

10,939. Provided the taxpayer's business produced more rupees?—Yes.

10,940. As regards stamps, how do you say any increase would take place?—In this way; if the civil causes increase in value, the stamps must also increase; there is an automatic increase in all departments of taxation with the fall in the value of the rupee. That is the real way in which the Government will get an increase.

10,941. Would you hold that that implies that there is an increase of wealth and prosperity in the country owing to the fall in the rupee?—I do not see how the fall in the rupee can either add to, or deduct from, the real wealth of the country.

10,942. It is only that more rupees are in circulation?—It is only that more rupees are in circulation; the real wealth will remain the same.

10,943. By the closure of the mints and raising the value of the rupee, do you think a fall in prices will be brought about?—Yes.

10,944. How is that caused?—The rupee increases in value.

10,945. But why? What makes it increase in value?—It has already increased.

10,946. But I want to know what is the action?—The rupee becomes more rare; its circulation contracts, and, therefore, it goes up in value.

10,947. Then you said that the year after the closure of the mints prices fell at once?—I believe so, from the figures I have compiled.

10,948. Do you think the closure of the mints by order of the Government in 1893 produced an immediate contraction of the currency, such as to affect prices all over India?—It must have done so from these official figures.

10,949. Are there no other causes which affected prices?—There could be no other causes which would affect prices in every division of India like this. There might be local causes for local variations.

10,950. I suppose, in the first year the contraction of the rupee would not be so great as in the second?—I should think not; probably not.

10,951. First of all it would not reduce the number of rupees in the country?—Probably not.

10,952. But it is not a question of juggling; you stopped the coinage of rupees; therefore you merely stopped adding to the currency, you did not take any away?—No.

10,953. Therefore the causes at work would be the export of rupees and the loss of rupees, and so on?—Yes.

10,954. So that the second year after the closing of the mints there ought to be more contraction?—Yes.

10,955. And in the third year there ought to be still more contraction?—Yes, other things being equal, there being no other influences at work.

10,956. Are prices lower now than they were in 1893?—Last year famine prices prevailed.

10,957. But this year?—Even now the indirect effects of famine are not yet over, because all the granaries are empty, and people are buying to fill them.

10,958. The contraction is not felt now?—I limit my examination of prices to the two years before the closing of the mints and the two years immediately after, leaving out the subsequent famine years.

10,959. You say that, when the mints were closed, prices fell. Do you say that that was due to the closing of the mints?—I believe so, because I cannot imagine any other cause which would affect all these different divisions of India alike.

10,960. Prices have now risen, have they not?—I believe so, on account of the famine.

10,961. So far as I have known, they have risen everywhere?—I believe so.

10,962. If you can imagine causes which raised prices, surely you can imagine causes which may make prices fall. For instance, if scarcity of crops tends to raise prices, or a demand for export tends to raise prices, the stoppage of exports and plentiful harvests might make prices fall?—But, as a matter of fact, there were no plentiful harvests in these years. I find from Sir Antony MacDonnell's evidence, that the years 1894, 1895, and 1896 were years of scarcity in the North-Western Provinces, and not of plentiful harvests. In Bengal, too, those years were bad years. Therefore, prices ought to have risen. Instead of that, prices fell.

10,963. You think the contraction must have taken effect at once?—I believe so, from these figures.

10,964. Now, contraction would raise the sterling value of the rupee, would it not?—I should think so.

10,965. Will you look at the value of the rupee in those years?—I am not a currency expert.

10,966. I do not wish to ask you questions regarding currency. I want to get at what the sterling equivalent of the rupee was. In 1892–93 the value of the rupee was 1*s.* 2*d.*; in 1893–94, 1*s.* 2*d.*; in 1894–95, 1*s.* 1*d.*; in 1895-96, 1*s.* 1*d.*; so that nearly all the time that this was taking place the exchange did not rise?—I cannot explain this, not being an expert.

10,967. The value of the rupee was even lower?—The sterling value may have been.

10,968. Therefore, I think you ought not to be so positive in these matters?—I am positive about the price of food grains.

10,969. But you ought not to be so positive with regard to the cause of the fall of prices?—I said I believed that the cause of the universal fall in prices

Mr. R. C. Dutt, C.I.E.

30 Nov. 1898.

in 1894 and 1895 was the closing of the mints, and I still believe it.

10,970. Now, with regard to the loss which you say occurs on the railways, are you acquainted with the history of the old guaranteed railways?—Not at all.

10,971. Do you know anything about the rate at which Government is bound to remit the surplus profits to England?—No; I do not know anything about those details. We are never consulted in these matters.

10,972. Because that has a great deal to do with the loss on the railways?—It may be so.

10,973. Even suppose there was that annual loss of two millions, or whatever it is, do you think that is really a high price to pay for the whole railway system of India?—No, I do not think it is a high price to pay for the whole railway system, but it is a high price to pay for these later railways which you have laid down in recent years.

10,974. For instance, the Assam-Bengal railway; is that open yet?—I do not know.

10,975. Do you think it is open the whole way?—No, I do not know.

10,976. Would you be surprised to hear that it is only open for a small portion at present?—I should not be surprised to hear that.

10,977. Until a railway is opened, it can hardly pay, can it?—No.

10,978. And until then one is not justified in saying that it will never pay?—No, but I say it will not meet any requirements of the general trade of the country.

10,979. How do you know that? Are you a trader?—I am familiar with traders in most districts in Bengal.

10,980. I am familiar with many merchants in London, but I should be very sorry on that ground to pronounce on the requirements of English trade?—But we must form opinions on facts in order to decide such a question.

10,981. You have lately come from India?—Not lately, I came at the beginning of 1897.

10,982. You are now resident in England?—Yes. I am a lecturer in Indian History at University College.

10,983. Do you think you could reduce the Government expenditure by employing more natives?—A great deal.

10,984. Can you tell us how many Europeans there are in the covenanted Civil Service?—About 1,000 I think.

10,985. Can you tell me how many natives are employed in the provincial service and in the subordinate services?—That I do not know, I have not the figures. You will find that by——

10,986. But I wanted to know if you knew?—I have not the figures with me.

10,987. Would you be surprised to hear that it is about 10 times the number of Europeans?—It may be, if you include the lower grades.

10,988. Including every grade in the provincial and subordinate services—the munsifs, and so on?—Yes, including men getting 6 and 5 rupees a month.

10,989. You have many districts in Bengal?—We have.

10,990. What would be the area of these districts?—A district of 6000 square miles would be a large one.

10,991. How many English officers would there be in a district of 6000 square miles?—I do not know.

10,992. Two or three?—Oh, more than that.

10,993. There would be the magistrate and the police officer?—Yes, and the doctor, the police superintendent, the assistants, &c.

10,994. Altogether, 4 or 5?—Yes, or more.

10,995. In a district of 6000 square miles?—Yes.

10,996. With a population of what?—3 millions.

10,997. Just one more question about that. If we were able to find natives to take the place of those five or six Europeans——?—But I am not confining myself to the districts only.

10,998. If you were able to find natives to ake the place of those five or six Europeans, would they serve the Government for materially less money than the others get?—Oh, yes, they would.

10,999. You think they would?—If you did not make a distinction—if you did not have two different scales of payment, one for Europeans and another for Indians, for the same service and the same work.

11,000. As long as no distinction was made, you think the natives would serve for less pay?—Yes.

11,001. Do you think we should maintain the standard of government in India in that way?—Yes. With the spread of education the time has come for a larger employment of the natives of India.

11,002. Lower paid natives?—Yes.

11,003. And lower paid Europeans?—Well, you would not get many Europeans at lower pay.

11,004. However, you say that that is a condition, that they should be paid the same?—Yes, I mean there should be the same pay for the same service and work.

11,005. (*Mr. Holland.*) Referring to the depreciation in the rupee value of hoards of ornaments, I gather it is the exchange difficulty which you wish to avoid?—Yes.

11,006. Have you considered whether that could be compassed by the levying of an import duty on silver?—I have not considered that question.

11,007. You have heard that such a suggestion has been made?—Yes. If there is a distinction made between the coined value of the rupee and the value of silver as bullion, then it would not remove the difficulty.

11,008. But one of the objects of levying an import duty, I imagine, would be to equalise that, so that it would avoid the difficulty from your point of view?—Yes, if the value of silver and the value of uncoined silver remained equal, that would avoid the difficulty that I am speaking of.

11,009. Anyone who, after the date of levying an import duty, wished to hoard ornaments, would, of course, be disadvantaged in comparison with the rate at which they could buy now?—They would get less ornaments as compared with their produce.

11,010. I just wish to call your attention to one sentence in the abstract of your evidence, which I will read to you. You say: "It is well known that "many of the manufactures of India have been all "but ruined within the memory of living men by an "unequal competition with the steam and machinery "of Europe." You pin your faith to that?—Yes, but I do not complain of that.

11,011. Would you be surprised to hear that the exact opposite is contended in this country—that many manufacturers here complain that they have been nearly ruined by the competition of India?—I should be surprised to hear that.

11,012. There are a great many people in Lancashire for instance, who think that the Bombay mill-owners have seriously prejudiced them by their competition?—The mills have only started lately.

11,013. Then you say, "I have, myself, within the "period of my service, visited villages of weavers "almost deserted and relapsing into jungle"?—Yes, I have seen that.

11,014. You do not hold Europe responsible for that?—I hold the competition responsible for that, but I do not complain of it, because we live in times of free trade.

11,015. As a matter of fact, Bombay is as much responsible for the ousting of the native weaver as Lancashire?—Possibly.

11,016. I venture to suggest that you are a little pessimistic when you talk of "the dying industries of India"?—But you will notice that I go on to add that I do not complain of this. What we complain of is any additional obstruction given to native manufacture. In Eastern Bengal I have travelled through many villages, and found the weaver caste had disappeared and gone elsewhere, and that is the same in other districts throughout India. I have seen

many dyers' shops closed in consequence of the discovery of aniline dyes in Europe.

11,017. On the other hand it can be proved, I think, that some of the new industries that you have mentioned now pay the natives of India better?—Not in the case of these aniline dyes.

11,018. But with regard to other industries?—Possibly.

11,019. (*Mr. Le Marchant.*) Do you consider that the rise in land revenue would keep pace with the fall in the value of the rupee?—It would follow after a few years. Eventually it would.

11,020. If you take a period of five or ten years, you would expect it to work out closely?—Yes, probably.

11,021. Have you observed how far that has been the case in the past? For instance, if you take ten years from 1886–87 (so as not to include this last famine year, which was exceptional) the fall in the rupee was from something like 17½*d.* to below 14*d.* It was a fall, I mean to say, of more than 20 per cent. and during that period the land revenue appears to have increased only from 23 to 26 crores, a rise of about 13 per cent. There we have an instance of a period of 10 years?—Yes, but there are some places in which settlements are still going on. Sir Antony MacDonnell says with regard to Oudh and the North-West Provinces the settlement is going on now. In Orissa and the Central Provinces the settlements have not been completed yet. When it is done, I think you will get more than your 20 per cent.

11,022. If the rupee were to fall just after the settlements had been concluded, the land revenue would be prevented for many years from rising in correspondence with the fall in the rupee?—For some period, but it will rise in the end, and during those few years probably the people will be a little better off—a result which neither you nor anybody else will regret—provided the Government gets its own proper share when the next term of settlement comes.

Mr. R. C. Dutt, C.I.E.

30 Nov. 1898.

11,023. And you think the area of production will continue to increase?—Yes.

11,024. Is it the case that there is sufficient available land for that purpose?—I find from Mr. O'Conor's evidence that he puts down the waste culturable land at 100 million acres, and the land under cultivation and pasture he puts at 240 million acres. Of course, the land which is not under cultivation is not of such good quality. However, there it is, and there is 100 million acres available.

11,025. Still there would be difficulties in bringing that land into profitable cultivation?—If rice and wheat fetch good prices, much of that land will be brought under cultivation. It all depends on the prices of food grains. As prices go up, land is brought under cultivation, and, as prices go down, land is put out of cultivation. That is going on every year in India.

11,026. Still, would not the margin of profit be less?—I admit it would be so.

The witness withdrew.

Adjourned.

TWENTY-FOURTH DAY.

Thursday, 1st December 1898.

PRESENT:

The Right Hon. SIR HENRY H. FOWLER, G.C.S.I., M.P. (in the Chair).

SIR JOHN MUIR, Bart.
SIR FRANCIS MOWATT, K.C.B.
SIR DAVID BARBOUR, K.C.S.I.
SIR CHARLES CROSTHWAITE, K.C.S.I.
SIR ALFRED DENT, K.C.M.G.
MR. ROBERT CAMPBELL.
MR. EVERARD HAMBRO.
MR. F. C. LE MARCHANT.

MR. ROBERT CHALMERS, *Secretary.*

The Right Hon. SIR JOHN LUBBOCK, Bart., M.P., called and examined.

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

11,027. (*Chairman.*) You are the Chairman of the London Bankers, and President of the Central Association of Bankers?—I am.

11,028. And I think you were also a member of the International Monetary Commission, and the Gold and Silver Commission?—Yes.

11,029. I understand that you wish to disclaim any personal knowledge of Indian finance; you simply deal with it as an expert in banking and finance?—That is so.

11,030. What was your opinion of the policy of closing the mints in 1893?—I should naturally wish to speak with all diffidence on the subject, and not at all dogmatically, but I very much regretted the closing of the mints at the time.

11,031. Did you think that the circumstances of the case did not justify it, or that it was radically wrong in itself?—As far as the facts came before me, I confess that I did not see that the facts necessitated the closing of the mints.

11,032. Do you think that a gold currency would be suitable to the requirements of India?—I think not.

11,033. Do you draw a distinction between a gold standard and a gold currency?—I quite agree with Lord Rothschild that you cannot have a gold standard without a gold currency; and I should like to go further, and say that what I have always understood to be a gold currency is a currency of which the main amount is in gold. Of course, there may be a subsidiary currency, whether a token currency or otherwise, in other metals, and there probably would be; but a country that had only, say, 20 millions of gold, and 100 millions of silver, would, I think, be properly described as having a silver, and not a gold, currency, or it might be described as having a gold and silver currency. But, if you speak of one metal only, you should speak of the metal which is the predominant partner, as it were, in the currency.

11,034. Are you acquainted with the monetary arrangements of Canada?—I have only a general knowledge; I think you will probably get that better from somebody else.

11,035. You said that you did not understand how there could be a gold standard, unless the currency was in the metal of which the standard consisted?—

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

I said that I did not think you could have a gold standard without a gold currency.

11,036. I do not know whether you have read the evidence of Mr. Clouston, the general manager of the Bank of Montreal. You will find at question 6755, in the evidence we have already published, that I put these questions to him:—"(*Q.*) You are general "manager of the Bank of Montreal?—(*A.*) Yes. "(*Q.*) That is the principal bank in Canada?—(*A.*) "Yes. (*Q.*) Have you many branches?—(*A.*) Forty-"four in Canada, two in the United States, and one "over here. (*Q.*) Is it a bank independent of the "Government?—(*A.*) Quite. We have the govern-"ment account, but they have nothing to do with "the management of the bank. (*Q.*) Just tell us "what is the standard and what is the currency in "Canada by which that standard is used?—(*A.*) The "standard is a gold standard, the same standard as "an American eagle. We have no gold coin of own, "but the American eagle and multiples of it (the half-"eagle and double eagle) and the English sovereign "are legal tender. We never see a gold coin in "circulation from one end of the year to the other. "(*Q.*) There is no gold in circulation?—(*A.*) "Practically none." Would that at all modify the opinion you have just expressed as to the impossibility of a gold standard without a gold currency?—I think that is what I should call an exchange standard. They keep their financial affairs in a satisfactory position by maintaining an equable rate of exchange. In ordinary conversation you might call it a gold standard, because it is kept on a par with gold; but I think, if you are speaking scientifically, and in a definite sense, it is an exchange standard, not a gold standard. And it is rather important to draw a distinction between the two, because, although in many ways they act in the same manner, there are others in which the effect is different.

11,037. Do you mean that, when Canada had to deal with its foreign trade, it would have to deal in gold?—That would be so.

11,038. But inside Canada they can get on without gold; they have entirely a token or a paper currency?—Yes, but it is not automatic; it has to be regulated by the Government, or the banks. It does not regulate itself automatically, as it would if they had a silver standard or a gold standard.

11,039. Is not a subsidiary token currency always regulated by Government?—But it is not the standard.

11,040. But I am rather looking to this point whether the internal currency of the country need be of the metal which is the standard. Let us assume, for the sake of argument, that we have a gold standard in India. In the first paragraph of your memorandum you say, "It seems to be generally "admitted that a gold currency would be unsuitable "to Indian requirements." I should think everybody would agree with you upon that point, because the transactions in India are so small, one-half of them being apparently in copper, but the general effect would be as stated by you, that a gold currency in the sense that we have it in this country—people carrying about sovereigns and half sovereigns in their pockets—would be unsuitable to the trade and habits of the people of India?—Quite so.

11,041. That being the case, is it necessary in order to make an effective gold standard that there should be a gold currency?—It seems to me so.

11,042. You say we cannot have an effective gold standard without a gold currency?—As long as the main currency is in rupees, and all contracts are made and taxes calculated in rupees, and transactions effected in rupees, and rupees are legal tender to any amount, it appears to me that the rupee is really the standard.

11,043. The rupee or silver becomes the standard?—It would depend upon what regulation you make, but, if you allow the rupee to be freely coined, then I say silver is the standard. If you shut the mints to silver as you have at present, then I consider that an exchange standard is the more technically correct description of it, because the rupee is now dissociated from silver.

11,044. Do you consider that you can have a gold standard in India, unless the Government are prepared to give gold for rupees at a fixed ratio?—I think not.

11,045. And that, you think, would be a very great responsibility for the Government to undertake?—The Government have expressed that opinion, and, as far as my opinion is worth anything, it appears to me that they are entirely correct.

11,046. The Government of this country is not under an obligation to give gold for silver?—No, but then silver is not a legal tender in this country, except in small amounts; and the silver circulation in this country is entirely a subsidiary and a minor circulation, so that I think the cases are entirely different.

11,047. They are different, no doubt, but do you regard it as an effective part of the token currency that the Government should be bound to give the standard metal for it?—Not if it is a token currency. My idea of a token currency is a currency which would not be legal tender, or, if at all, would be legal tender only in such small amounts that practically it would be merely for convenience in small transactions that would not come into consideration in commerce at all.

11,048. Will you give us your definition of an "exchange standard," which is, I think, a phrase of which you are the father?—If a Government issue inconvertible notes, or rupees when the mints are closed, which I should regard practically as notes printed upon silver, and then undertake to keep them at a certain value as far as they are able, I should call that an exchange standard, for the want of a better name.

11,049. Is there any objection to an exchange standard?—I think there is this objection, that an exchange standard is not automatic. The currency will not expand or contract according to the requirements of trade, but it has to be regulated either by the Government or by some financial institution. We know there are at present in India great differences of opinion as to whether the currency is redundant or deficient. Some authorities maintain that it is deficient, and that it ought not to be still further curtailed; others maintain that it is redundant. You have two totally different interests. The interests of some people would be to have the currency curtailed, and others would be benefited by having the currency increased. That the Government should have to decide between those two conflicting interests appears to me to put them in a very difficult position, and one which it is very undesirable they should occupy, if it can be avoided.

11,050. How does the consideration of this fact affect your judgment: that at least 80 per cent.—I think probably a great deal more—of the trade of India is with gold-using countries?—I think, as far as it goes, that is an argument in favour of a gold currency and a gold standard; but I regard the internal trade of a country as being much more important than the external trade, and, therefore, in considerations of currency, it is more important to consider what is convenient for the internal trade than for the external trade. I also think that, as regards external trade, the inconvenience of exchange fluctuations has been considerably exaggerated.

11,051. We were informed that, as far as the internal trade of India is concerned, the closing of the mints has practically produced no effect whatever, that the rupee is practically what it was, and that all the internal trade transactions of India go on as they did before?—Of course, there is the question which I alluded to just now, of either redundancy or stringency of currency — the actual circulating medium—upon which the evidence is, perhaps, to some extent conflicting.

11,052. But, assuming that the internal trade is not affected, either by the closing or the opening of the mints, what would you say then?—I do not think

the internal trade has been materially affected; but prices have been very materially affected by the closing of the mints; the internal trade has not been affected, because you have left silver in circulation, which is convenient for the majority of the transactions of India, excepting in so far as they are of a still smaller amount.

11,053. You think prices have fallen in India?—I think prices would have risen if the rupee had been allowed to fall to the amount of the intrinsic value.

11,054. The evidence seems to show that recently prices have somewhat risen in India. That is Mr. O'Conor's evidence?—Yes.

11,055. Do you think the Government should now take any steps? You stated to us your difficulty with reference to a gold standard, and with reference also to the advantages or disadvantages of an exchange standard. What would you advise?—I very much regretted the closing of the mints, but at the same time, of course, we have to consider what should be done under existing circumstances. I suppose that the Indian Government have committed themselves to maintaining an exchange somewhat approximating to 1*s.* 4*d.* Having done that and given notice that such was their intention, I think they are bound to adhere to it, at any rate for the present, and therefore the experiment ought to be given a longer trial. But I venture to suggest that it would be a good thing to put an import duty on silver, which I think would have considerable advantages. In the first place it would bring in a substantial revenue; in the second place it would tend to increase the demand for Council Bills; and in the third place it would diminish the difference between the value of coined and uncoined silver in India. I do not concur with those who consider that the people of India have been robbed by the Government in the course they have adopted, but I do think those that have accumulated silver, with the idea that they could pay their rents and meet their other obligations by turning it into rupees, are placed at a disadvantage, and I should be rather afraid that it might possibly lead to considerable political feeling. Of course, on that point the Committee are much better able to judge than I am. But it seems obvious that whatever tended to reduce the difference between the value of the uncoined silver in India and that of the rupee, would be a great advantage to those that have accumulated silver in preparation for bad times, and would diminish any complaint there might be as to the loss to be sustained on the uncoined silver which they hold.

11,056. Would it be part of that suggestion that the mints should be re-opened?—I do not think you can safely re-open the mints as matters are at present, even with a duty on silver; but it seems to be impossible to foretell what the value of silver will be in the future. It depends so much on production and various other circumstances; and, having regard to the very great increase in the production of gold which is now taking place, I should think it is at least as likely that silver will rise as that it will fall. If silver should rise, then I think it might be possible, after putting on an import duty and a seignorage, say of one penny, to open the mints, and it would certainly be very desirable to do so.

11,057. You know that there is at present an import duty of 5 per cent.?—Yes, and therefore the principle is conceded.

11,058. What would you consider that should be turned into?—6*d.* per ounce is what I have suggested. Of course, if one was in a responsible position, one would wish to make inquiries before determining the amount. I think it should be a fixed amount. I would rather have it fixed at, say, 6*d.* per ounce than, say, 25 per cent., because that would vary according to the price of silver.

11,059. What would the effect be on the value of silver if a duty was put upon it? I am assuming, of course, that the mints were open?—It would tend to raise the rupee price.

11,060. Would it not be an artificial raising of the price of silver?—I think it would. I do not think it can be logically defended as a course to be taken by itself. I regard it as a *pis aller*, considering the circumstances in which we find ourselves. It is not what I should recommend as an abstract advantage.

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

11,061. It would be, as you say, an artificial raising of the value of silver in India only?—That is so.

11,062. Then, if silver remains, as you propose it should, the standard, that would be an artificial raising of the standard?—I do not contemplate that the Indian Government would raise the standard above 1*s.* 4*d.* My object was to enable them to keep faith with those who had trusted in their declaration that they were going to keep it at about 1*s.* 4*d.*

11,063. I do not mean about the exchange value being at 1*s.* 4*d.*; but I understood you to base your position rather on the injustice to the Indian who had accumulated silver for future purposes, and then found that it had depreciated in value; and you propose to put on a duty, in order to level up the value of silver already accumulated?—I put that forward as one of the advantages.

11,064. Then for coinage purposes, and for use in India, the Indian purchaser of silver would have not only to pay the intrinsic value of the bullion, but he would also have to pay a tax to the Government?—As far as he was going to use the silver for ornaments, that would be so. As far as the silver is used for currency it would not be so more than it is at present.

11,065. But the moment he goes outside India, and wants to buy gold with that silver, then the artificial increase in its value is gone, is it not?—I do not think he would do so. He would turn the silver into rupees, and the rupees would be at 1*s.* 4*d.*

11,066. Then you would have to have your exchange standard. The Indian Government, before the present alteration took place, had to buy in London a certain amount of gold with bullion—practically with the bullion value of the rupees they received?—I thought you were speaking of the individual Indian, not the Government.

11,067. I will say the individual merchant. Take the individual purchaser of English goods. He has to find a certain amount of gold in London to pay for them, and formerly he had to buy that gold by the bullion value of the silver in the rupee?—If he has to make payments out of India, what he has to consider is what is the value of the rupee, and what is the cheapest form of remittance. It might be that the fact of there being an export duty on silver might make it not the cheapest form of remittance. It is self-evident that, if you put an import duty on silver, you would tend to reduce the amount of silver that would be imported into India; and, of course, that would also have a tendency to increase the demand for Council bills, which are the competitors with silver.

11,068. It would not increase the intrinsic value of silver?—There would be the difference in the value of silver inside and outside India of about 6*d.* an ounce, just as tobacco inside England is worth more than tobacco which is in bonded warehouses or outside England.

11,069. But, if a Government may artificially increase the value of bullion, is not that exactly the same process as artificially depreciating the currency?—I admit that it is an undesirable thing in itself to put a duty upon the metal which is the standard of value; but the Indian Government was in circumstances in which it was obliged to do something, and the question was what was the least evil. It appears to me that, under the circumstances, that is the least evil.

11,070. You admit that it would be a grave evil?—Oh, yes. But I do not think it would be a grave evil as compared with the present condition of things.

11,071. What do you say about a stable exchange?—A stable exchange is very desirable. But I think the importance of it has been somewhat exaggerated; and I should draw a distinction between what is really a difference in exchange, that is to say, the difference

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

of gold, we will say, as between one country and another, which is limited by the expense of carriage and insurance and freight and so on; and what is generally called in speaking of the Indian currency "exchange," which is really a question of the fall in the value of silver.

11,072. Do you think that has been exaggerated?—I think the fall has been a great evil to the Government, because of the great difficulty of increasing the taxation of India; but I draw a great distinction between differences in the true exchange, which can only vary within the limits of carriage, freight, insurance, and other small expenses; and the exchange, as it is generally called in India, which is quite a different thing, and the fall in which is due to the fall in the value of silver.

11,073. In India the difficulty arises from there being two metals of different value?—To some extent. It is very unfortunate that we have nothing that is absolutely stable in nature. We are in that condition, unfortunately.

11,074. And the instability in exchange arises from the fluctuating value of silver as compared with the value of gold?—Silver has fluctuated largely as compared with gold, no doubt, of late years, because the production of silver rose enormously, and various countries, for different reasons of their own, substituted gold for silver, and thereby, just when the production of silver was increasing, they have diminished the demand for silver and increased the demand for gold. But there seems to be no reason in the nature of things why we should regard silver as being less stable than gold. It might quite well have happened that the reverse operation might have taken place, and that the demand for silver might have been increased and the demand for gold decreased. I am old enough, I am sorry to say, to remember when there were apprehensions on that score after the Australian gold discoveries.

11,075. You say that, so far as the revenue is received in rupees, a fall in the rupee would mean a reduction of the revenue?—I do not wish to lay too much stress upon that; but, as the revenue of India was received in silver and silver has fallen, although they have received the same nominal amount, practically it was a lower revenue.

11,076. And, therefore, if the expenditure did not diminish but considerably increased, it involved a large increase of taxation in order to make up the deficit?—That is so.

11,077. Do you suggest that any borrowing might be necessary for a short time, or would you approve of any borrowing?—I should have preferred borrowing for a short time rather than to close the mints.

11,078. Now you want to say something about the land tax. I do not like the phrase "land tax." I use the phrase "land revenue"?—I really do not know that I need go into the question, unless the Committee wish me to do so; but it did seem to me that some persons confuse the functions of the Government as a Government, and as a landlord. Where the Government made an arrangement with a particular individual that he was to pay a certain amount for a certain time, I think it would be most unjust to make any revision of that on account of the bargain having turned against them; but, if a country finds itself under the necessity of raising additional taxation, of course it must be considered how it can do that to the best advantage. As to a land tax, I should say the Government might alter it in India, just as our Government here might alter it.

11,079. The position of things is this, that in India the Government is the owner of the land, and the land revenue is the rent. There is no tax on land; it really is a ground rent, and that is practically subject to the revision of temporary settlements every 30 years. The Permanent Settlement made by Lord Cornwallis a century ago was fixed finally, and therefore that is very much against the Government. Now, in suggesting that any alteration should be made to raise additional revenue, would it not be breaking the contracts with existing tenants, and, of course, raising a great deal of political agitation?—My own idea as regards land revenue is this:—I understand these settlements are falling in.

11,080. They are "revolving," as it may be termed?—They are revolving, and as they expire they would naturally be considered in the light of the fact that the rupee was not worth what the rupee had been before, and that therefore it was fair to expect them to pay a rather larger number of rupees. Of course, it would be a process that would take some time, and, though you would get something additional at once, you would not be able to get the full equivalent to balance the fall of the rupee for a certain number of years. That is why I suggested it might be necessary to borrow for some time. As regards putting on a general tax, I am not advocating that; that is entirely a matter for the Indian Government. I was merely saying that there is an essential difference between putting a land tax on the land as a whole, and raising the rent payable by certain individuals. If you altered an arrangement which you have made with a single individual, it would be very unwise to do so; but, if you determined to put a tax of so much on the land of India, that would apply to the whole of the land of India, just as a tax here would apply to the whole of the land of England. It would not be affected by the question of the particular arrangement which the Government had made with particular individuals.

11,081. Now, there is a suggestion that you wish to make with reference to the debt, as to the burden on the Government?—Where the Government had silver liabilities, of course the fall in silver did not really affect them so much, and I think it must be remembered that, so far as regards the silver debt, really that was practically lightened by the fall in the value of silver. Of course that does not affect individuals, but it does affect the country as a whole. A country which has a debt payable in silver has its debt lightened by a fall in the value of silver.

11,082. I see that in the abstract, but not in the concrete. The whole of the taxation of India is received in rupees; that is the mode in which it is paid. Now, as you say here, and I assume you are correct, the interest on the silver debt is Rx. 3,750,000, and you put the interest on the gold debt at 3,800,000*l*. As a matter of fact, the interest on the gold debt is about one million less than that. Whatever the interest on the debt of India is, it has, so far as the Government of India is concerned, to be found in rupees. Rupees have got to be provided out of taxation—such an amount of rupees as will in London purchase the gold necessary to pay the interest in London in gold on the debt. Now how do those two operations balance one another?—I have no doubt you are correct about the gold debt; I took the figure from Sir Henry Waterfield's evidence on page 162, but I have no doubt your correction is right. If the Indian Government had received their revenue we will say in gold, and then had to pay the interest in silver, as the silver has fallen in value it seems to me that to that extent they would have their burdens lightened.

11,083. But they do not receive any revenue in gold, they receive it all in silver. Let us take this case. Here is 1,000 rupees that is to be appropriated, 500 for paying interest on the silver debt, and 500 for paying the interest on the gold debt—I am taking the old figure of 2*s*. to the rupee. Now the revenue remains—the 1,000 rupees. The Chancellor of the Exchequer in India has to pay the Government creditor in India just as much as he always had to pay, namely 500 rupees, but, instead of his 500 rupees purchasing 50 sovereigns in London, the 500 rupees will only purchase 30 sovereigns, therefore, he must send so many more rupees, or sell so many more rupees, in order to buy in London the other 20 sovereigns?—Certainly, that is so, and therefore so far as the Government is concerned, I quite follow your contention, but, so far as India is concerned (speaking here of India, and not of the Government), she would

have to send a smaller amount of produce, because the silver which she would have to pay would be worth less; therefore, whatever the amount which she has to pay on the silver debt, the produce would go further in paying it. But so far as the Government is concerned, I agree with you.

11,084. Now you suggest a seignorage of 1*d.*; is not that rather a large seignorage?—It is rather large, but I do not think it would lead to any great practical inconvenience. You would not levy a seignorage, of course, until you found that the condition of the silver market was such that, by levying a seignorage, you could then open your mints. I have assumed that the opening of the mints would create an additional demand for silver, and that it would have a moral effect on the silver market; and, I think, in assuming that the opening of the mints would make a difference in the price of silver equivalent to nearly 2*d.* in the rupee, I am taking a moderate figure. I have consulted several authorities in the City, and they seem to think that that is a moderate figure to take it at. Then, of course, the 6*d.* an ounce in silver would be equivalent to 2*d.*, and rather more. If you had the silver market in a condition at which that very nearly brought the rupee to 1*s.* 4*d.*, then a seignorage might make it safe to open the mints, which I think in itself most desirable for the people of India.

11,085. (*Sir F. Mowatt.*) That is based on the assumption that with open mints the rupee would fall to 1*s.* 2*d.* in value?—No, I think not. If you had silver with the intrinsic value at 11*d.*, and if the effect of opening the mints was equivalent to 2*d.*, that would bring the value to 1*s.* 1*d.*; with the duty and the seignorage it would then be 1*s.* 4*d.*

11,086. I mean, you proceed on the assumption that the opening of the mints would bring silver to about 1*s.* 2*d.*?—I suggest that it would make a difference of 2*d.*, or nearly so.

11,087. (*Chairman.*) You know the effect of the purchases of the American Government under the Sherman and Bland Acts. There was a steady fall of silver, notwithstanding those great purchases. I want to know whether you think that, supposing the mints were opened for the unlimited coinage of silver, it would affect the silver market?—I think, certainly, it would affect the silver market.

11,088. Did it in America?—I think it did. It did not prevent the fall, but the fall would have been greater than it was if the Americans had not been buying silver. It did not prevent the fall, but it diminished the fall.

11,089. The fall still went on during all that period?—Yes, and it is perfectly possible that, in a country where you have a gold standard and a gold circulation, you may have a fall; you are open always to the possibility of that altering. I do not say it is likely, but it is quite on the cards that there may be an enormous development of the production of gold, and the sovereign might alter in value intrinsically.

11,090. I suppose the real influence which would settle the price of silver would be the cheapness of the cost of its production and an abundance of the metal?—As compared with the demand.

11,091. Do you and your friends with whom you have talked it over think that, taking the cost of production as it is now, and a reasonable estimate of the sources of supply, the price would be affected? The coinage of silver in India when the mints were open, was on an average about 6 crores a year. Now we cannot assume that it will be much more in the future than it has been in the past. Do you think the sudden purchase of six crores of rupees would produce such a change in the silver market, as to raise the price by the figure you were mentioning to Sir Francis Mowatt, 2*d.* an ounce?—The effect of closing the mints, I think, was a sudden fall in silver of 11 per cent.

11,092. But you remember that it was after the closing of the mints that they repealed the Sherman Act?—It is very difficult, no doubt, to determine what was due to one cause and what to another.

11,093. Assume that the effect of re-opening the mints would be to create an increased demand of from 10,000,000 to 15,000,000 ounces, what effect do you think that would have on the silver market?—It is very difficult to express a decided opinion. I feel strongly that the effect would be a substantial rise.

11,094. You think it would?—I think it would.

11,095. Is there anything further you desire to add?—I should like to add that I concur very much with what fell from Lord Rothschild, with reference to the railway policy. I think it is very important for the Indian Government to encourage English capital being invested in Indian railways, and that the line which the Indian Government has taken has tended to discourage it. Also that it was a mistake to fix the maximum, and not the minimum, of the rupee; because, as soon as the rupee comes near the maximum, naturally anybody who has free money takes it from India, because he has nothing to gain by leaving it there, and may lose by not taking it away. That is an undoubted effect of the existing state of things.

11,096. Having fixed, as it was never intended to do, but as was practically done, a maximum of 1*s.* 4*d.*, and no minimum, that creates a tendency to send capital out of India?—As soon as the value approaches to 1*s.* 4*d.*

11,097. And that is a state of things that you think it is desirable to terminate?—Yes, I think it is an undesirable state of things. Then, I venture to deprecate the raising of a gold loan. I do not see any need for that. At present I do not see that the moral effect of the Indian Government doing it would be an advantage, or that anybody doubts the solvency of the Indian Government at present. It also seems to me to be unnecessary to melt down rupees. I cannot help thinking that with the increase of population and the natural wear and tear of the coin that is always going on, it is quite unnecessary to melt down any rupees.

11,098. In fact, you do not concur in the proposals of the Indian Government?—No, I do not concur in those proposals.

11,099. Have you thought of the Lindsay scheme at all?—The Lindsay scheme seems to me to be a complicated one. I think, if you are really to have a gold standard and a gold circulation, you must do it in the way that Russia and other countries have been doing it; but in that case it seems to me that you would have to replace the great bulk of your present silver currency by a gold currency.

11,100. Will you tell us why you think that?—Because the coin which is the legal standard must be the main coin. You cannot have an enormous amount of token coinage floating about in the country. It would not keep its value, and, if you are really going to have the gold standard and gold currency, the gold currency must be the main currency of the country, as it is here. Of course you would naturally require a certain amount of silver for small change, as we do here, and probably, under the different circumstances of the country, you would keep a larger proportion in India than you do here; but I do not think you could be said to have a gold currency in India unless, supposing the currency were 130 millions sterling, 100 millions were in gold or notes issued against gold. Then if you are going to sell 90 millions or 100 millions of tens of rupees, I think the moral effect on the silver market of destroying the demand, and the effect also of throwing an immense amount of silver upon it like that, would be a very heavy loss to the Indian Government.

11,101. Let us take that operation through its various stages. Assuming that argument is sound, that 75 per cent., you would say in round figures, of the currency of India should be in gold, that is, assuming that the present currency of India is something like 130 millions, that 100 millions of it should be in gold, the 100 millions cannot be in gold without rupees being surrendered for the purpose?—Rupees would have to be surrendered no doubt, but

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

they would be surrendered at the rate of 1*s.* 4*d.*, and the Indian Government might have to sell them at 6*d.* or 8*d.*

11,102. Why should they? The internal trade of India is carried on entirely with rupees. You must assume, for the sake of argument, that the rupee remains an unlimited legal tender. If the Government give a sovereign for 15 rupees, then, to the extent of every sovereign paid out, the currency is contracted by 15 rupees?—In the first place, as long as rupees are legal tender to any extent, I should humbly venture to suggest that the rupees are the standard, and that it is a fallacy to talk about gold being the standard as long as rupees are legal tender to any amount. But I am assuming that, other things remaining the same, the total amount of circulation in India would be about what it is now. The present circulation is about that which keeps the rupee at 1*s.* 3½*d.* or 1*s.* 4*d.*; of course, India may require from increase of population and the development of trade a greater circulation, but, assuming that things remain as they are, the amount of the circulation to keep the rupee at 1*s.* 4*d.* must be approximately what it is at present. Therefore you can only force 90 millions or 100 millions of gold into circulation by taking 90 millions or 100 millions of silver out of circulation, otherwise it would be doubling the amount of circulation.

11,103. If the artificial element did not come in, the value of the rupee at the present time would be only 10*d.*?—Certainly.

11,104. To use your own words, what the Government establish is an exchange standard. If they had not done that, the rupee would be 10*d.*?—No doubt, and my argument is this, that, if things remained approximately as they are in India, the circulation must remain approximately what it is at the present time. Therefore, if you are going to introduce 100 millions of gold into that circulation, you can practically only do that by taking 100 millions of silver out of it. That 100 millions of silver is now circulating in India at the rate of 1*s.* 4*d.*, and it will be tendered to the Government at 1*s.* 4*d.*, and the Government will have to pay for it at the rate of 1*s.* 4*d.*; but, when the Government send that silver here or anywhere else to sell it, instead of getting 1*s.* 4*d.* they would only get 6*d.* or 8*d.*, and would lose the difference.

11,105. But would not the next step be this, that, the moment these people had paid their 100 millions in rupees and got gold, they would try to get their gold into rupees again, because they would want rupees, not sovereigns?—But you are assuming that the circulation of India was to contain 100 millions of gold.

11,106. I am assuming that the present circulation in India is 120 millions or 130 millions of tens of rupees. Then the next point to assume is that the Government is bound, when anybody tenders 15 of those rupees, to give a sovereign in exchange for them—which is an obligation which does not exist, by the way, on the Government of this country with reference to shillings; but, assuming that to be so, then the owners of the rupees would go to the Government and get gold. Now, what are they going to do with the gold when they get it?—I have very grave doubts whether, in the condition of India, you could get a gold circulation. That is merely an opinion. Of course, my opinion is not worth anything.

11,107. It is worth a very great deal, and we attach great importance to it. I do not know whether you read Lord Northbrook's evidence?—Yes, I read Lord Northbrook's article, and also the evidence that he gave here. He considers that gold is the proper standard for India, and points out that it was the standard in the time of the Pathan rulers of India, and in the time of the Moguls, and in the time of the East India Company, when it was abandoned. The inference I should have drawn from that would have been, that, as gold had been tried and abandoned, it was pretty clear that silver was more suitable for the requirements of India than gold. All I am contending for is that, as long as you have 100 millions of silver in circulation in India, and only a small amount of gold, practically the standard is silver, and that, if the Indian Government is determined to have a gold currency and a gold standard, then, as the currency cannot be increased, if you are going to substitute gold for silver, you will sell that silver at a ruinous price.

11,108. You are assuming that you are going to sell the silver, but Lord Northbrook does not contemplate that?—Lord Northbrook does not contemplate 100 millions of gold.

11,109. No, his point is that 20 millions of gold will do?—My view is—it may be wrong—that, if you have a currency 110 millions in silver and 20 millions in gold, you may describe that as a gold and silver currency, or you may, for shortness, describe it as a silver currency, but you cannot correctly describe it as a gold currency when the great bulk of it is in silver. Lord Northbrook begins by saying that he is going to have a gold currency and a gold standard. When he comes to develop that, and explain what he means, it appears that the currency is to consist of 110 millions of silver and 20 millions in gold. In my humble judgment, that is not a gold currency. You may call it a gold and silver currency, or, from the principal metal, you may call it a silver currency, but it is not a gold currency, and cannot be correctly so described. I had understood, from reading Lord Northbrook's evidence, that he intended that the great bulk of the currency should be gold, and not silver; but I find, from reading the article, and from communications I have had with him, that that is not his idea of a gold currency. Then, when we come to the standard, he proposes to leave 110 millions of silver circulating in the country. Practically, all transactions are to be in silver, contracts are to be made in silver, and silver is to be legal tender. It is quite true that a person may pay gold if he likes, but, as long as the gold is worth more than the silver, nobody is likely to do that. Therefore, it appears to me that silver would be practically the standard, and that what he proposes is not really a gold currency and a gold standard.

11,110. How do you apply that argument to Canada?—Canada, I think, is on an exchange standard, which has kept a certain relative value to gold, in the same way as France. I observe that the Indian Government speak of France as having a gold standard, but Mr. Hambro will confirm me when I say, and there is no doubt about the fact, that in France 5-franc pieces are legal tender to any extent. They are not worth intrinsically the value at which they circulate; the French gold is also so very much worn and defaced that, if you were to melt it down, it is not worth the price at which it circulates; but the Bank of France regulates the issue of coinage and notes in such a manner as to keep the exchange constant within small differences to 25·20 for the £ sterling; it is really based on the £ sterling; and I think it is rather a proud position for this country to be able to say that the French standard at this moment is a standard based on the £ sterling.

11,111. Is that any injury to France?—It is an unsound position, I think. They have an immense amount of gold and silver, which is no doubt very useful for internal purposes, but, if they were to come to export it, they could not export it; whereas we have a very large amount of gold in circulation, which is really a reserve for the country. If we had a war, and really required it, we could send that gold abroad, and replace it by notes. I hope we shall never be driven to that, but we have that reserve, whereas what the French have, if it is a reserve at all, is a reserve which can only be used at a ruinous loss. Then, the foreign trade of France is only small compared with our own. The French have a very powerful institution in the Bank of France, which is very well managed indeed, and quite independent of the Government. The Bank of France regulates the amount of coinage that is to take place, and so on.

But, in the case of India, though I should wish to speak with every respect of the Presidency banks, which are excellent institutions, they do not hold the same position as the Bank of France does. The currency in India, under these proposals, will really have to be managed by the Indian Government; and the Indian Government will find themselves attacked on the one hand by certain people who have interests in lowering the value of the rupee, and who will maintain that there are too few rupees, and that more ought to be coined; whereas other people, having opposite interests, will maintain that the rupee is redundant and ought to be curtailed, and the Government will have to decide between those opposing interests. That is a very invidious position for the Government to be in, and one which it is very undesirable, if it can be avoided, that the Government should be placed in.

11,112. In my questions, of course, I am not contrasting the financial position of France as against Great Britain. What I am wanting to see is whether the defects which you point out to us in establishing a gold standard in India, with a limited currency, do not already exist in France. Their currency is not unlimited, is it?—No.

11,113. They are not obliged to pay you gold for a cheque on the Bank of France?—No, they have the option.

11,114. Side by side with that, for all the internal trade of France, the 5-franc piece circulates for double its bullion value?—Yes, I suppose it is about that.

11,115. Just as our shilling does?—Yes. But the shilling is only legal tender up to 2*l*.

11,116. For our real business purposes our shilling is worth the twentieth part of a sovereign, whereas its real intrinsic value is not more than one forty-fifth of a sovereign, I suppose?—Yes.

11,117. Now I want, in conclusion, to ask you this: Putting on one side the proposals of the Indian Government, and putting on one side the proposals of Mr. Lindsay, Mr. Raphael, Mr. Probyn, and other experts, simply confining yourself to the question whether it be possible to establish a gold standard in India, with a restricted, in the first instance, but eventually, if you like, an unlimited convertibility of the rupee—would that be a desirable financial system for India? I mean, making the rupee entirely a token coin?—If you have a small amount of circulation of the rupee—10 or 20 millions—which would be about the proportion that you could have as a token coinage, then I think that you might undertake to give gold for it; but, if you have 130 millions of silver, or anything approaching that, the Indian Government have considered—and if I may say so, I venture to think very wisely considered—that they will not undertake the responsibility of giving gold for that amount; and as long as you have the great preponderance of the circulation of India consisting of silver, that silver being the basis of all contracts, and being legal tender to any amount, and the Government declining to undertake to exchange it for gold, I do not think you can be said to have a gold standard. It seems to me that the rupee will still be the standard.

11,118. (*Sir F. Mowatt.*) You assume, I think, that the silver currency for India is about 120 millions of tens of rupees?—I have taken Mr. O'Conor's figures.

11,119. And that the large majority of transactions are so small that they must be carried on in silver rather than in gold?—Quite so.

11,120. And I think also you say that, either by import duties and a seignorage and opening the mints, or by the arrangement which the Government proposes, it is now necessary to maintain the rupee at or near 1*s*. 4*d*.?—I understand that the Government have pledged themselves to that.

11,121. That being so, I feel a little perplexity in following what you said about the difficulty of the gold standard. If this 120 millions is required in silver, why should the native take his silver to the mint, and ask for gold? He will get a coin, at that rate, which is not so convenient for his transactions. Why should he go and get it?—My statement was that it seemed to me that silver was the more convenient currency for India.

11,122. As soon as he takes his rupees, the number of rupees in circulation will become smaller?—Yes.

11,123. And as soon as it becomes so small that he cannot conveniently carry on his business with it, the rupee will rise in value?—That is so.

11,124. When it rises in value, will he not take the sovereigns, in one form or other, back and ask for his rupees again?—In that case you would not have a gold circulation.

11,125. But, supposing, for instance, 30 or 40 millions of tens of rupees are brought to the mint, and gold asked for in exchange. The pinch on the rupee would be so great that it would rise very considerably in value, would it not?—It might.

11,126. Then one of two things would happen. Either they would not go to the mints, and would not get the gold, in which case there would not be this 120 millions in circulation, or they would find it necessary to take back the gold and buy rupees again; otherwise they could not carry on their business?—It would depend on what they did with the gold. If the gold was put into circulation, to that extent the silver would be diminished.

11,127. I have rather assumed, and all the evidence that we have had is, that a very large amount of silver currency was absolutely essential, from the nature of the transactions in India?—I should think that was so, certainly.

11,128. That amounts to saying, does it not, that the whole of the silver currency, or any large part of it, could not really be changed for gold?—I think a large part might; the whole certainly not. But I suppose the Government thought that so much might be changed for gold that they could not take the responsibility of exchanging all of it.

11,129. We have had the equivalent of 15 or 20 millions sterling suggested. Then, assuming that the great bulk of the transactions must still be in rupees, and only a very small part of the transactions in gold, that, you say, is not really a gold standard or a gold currency, but it must be described by some other name—an exchange standard, or a silver and gold currency and standard?—I think, as long as the mints are not open, it is not a gold currency.

11,130. But does it really matter whether it is called a gold currency, or an exchange currency, as long as its effect on trade is the same?—I do not think its effect on trade is the same. In many respects an exchange currency well managed has the same effect as a gold currency. You will see in my paper I have not proposed to alter that at present in India, but the disadvantage of an exchange standard, where it differs from a gold or a silver standard, is that an exchange standard must be managed and manipulated by somebody, either by the Government as it is in India, or by a great financial institution as it is in France. Therefore you do not get under an exchange standard that elasticity which you have under open mints.

11,131. Now, assuming that a large portion of the transactions must be in rupees, to that extent the full amount of the currency could not be in gold?—Yes.

11,132. And the larger that proportion is, the smaller amount of gold will get into the currency; the larger the proportion of trade that was necessary to be carried on in rupees, the smaller the proportion that it would be necessary to carry on with the gold currency?—I think so.

11,133. Although the amount of the silver currency would be larger than that of the gold, yet, so long as the Government guaranteed the rupee at 1*s*. 4*d*., it could not fall below 1*s*. 4*d*., because there would always be gold to be given out at that price, if rupees were brought to the mint?—Certainly. I do not doubt the power of the Indian Government to do it, but I

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

venture to think they are wise in not undertaking the responsibility.

11,134. (*Chairman.*) May I refer you to Lord Rothschild's evidence. This is at Question 7621—"You think a gold standard without a gold currency "impossible?—I do, and I would go still further. I "think, if you make up your mind to introduce a gold "standard and a gold currency together, you must be "prepared on occasions to send gold back to London." Then he gave some evidence explaining his reasons for that, and then I asked him this: "What time do "you consider would be sufficient to establish a "gold currency in a normal state of affairs?—My "idea was that the Indian Government as a "Government would only have to provide 20,000,000*l.* "of gold, and, either by preventing the importation of "silver, or by putting a heavier duty on it, a certain "amount of gold would flow automatically to India, "and I would have supposed that it would not have "taken India more than two years, if so long. I "wrote to Vienna and asked them for particulars of "what happened there, and they sent me this paper "in German. They raised, I think we may say, "30,000,000*l.* sterling, but they only bought "20,000,000*l.* of gold, and they put a foot-note here "showing that it did not take them three years to "bring about the change. Now, if Austria can do "that in three years, India can certainly do it more "quickly, backed up with the credit of the English "Government." I do not know whether you have seen that estimate of Lord Rothschild's as to the 20,000,000*l.*?—Yes, I have seen that estimate and I quite agree with it, but I should not consider that that would be a gold circulation.

11,135. I do not know whether you wish to leave upon our mind this impression, that we could not get a gold currency and a gold standard without practically providing 100,000,000*l.* of gold. You said that 75 per cent. of the currency must be in gold in order to get absolute convertibility?—I think that what Lord Rothschild meant there was that the Government could not buy more than that amount. In the case of Russia, the Government collected their customs in gold; they have stopped the produce of the mines from leaving Russia, and they have gradually accumulated gold in that way. I think the Indian Government might do that too. I am very far from saying that, if the Indian Government chose to do it, it could not be done; but my argument is this, that, as the currency must be kept at about the same amount, to whatever extent you issue gold you must reduce the quantity of silver, if you are going to keep the standard to 1*s.* 4*d.*

11,136. Supposing the operation were decided on, what would be your opinion of the quantity of gold that would be required for safety and success? Lord Rothschild puts it at 20 millions, and I think Sir Samuel Montagu put it at rather less than 20 millions, and some witnesses put it as low as 15 millions. Of course it is a very serious opinion of yours, if you think it really would require eight or nine times that amount. If it would take 100 millions of gold, it is of course, one may say, beyond the limits of possibility to establish a gold standard?—My contention is that you could hardly call it a gold currency unless the great bulk of it was gold. You might have half gold and half silver, and then I should call it a gold and silver currency.

11,137. But Lord Rothschild said he would not consider it a gold currency unless the rupee was absolutely convertible?—I have gone on the basis from the beginning that the Indian Government declined to undertake the responsibility of giving gold for the rupee to an unlimited extent, and I am bound to say that they seem to be very wise and prudent in doing so, but, that being the case, I do not think it can be said that you have a gold standard. I should have certainly thought that, if you were really to have a gold currency and a gold standard in India, at least half the currency of India must be in gold. India is a country where the transactions are smaller than here, and probably it would not be necessary to have quite the same proportion of gold as here.

11,138. (*Sir J. Muir.*) I think we understood that in 1893 you did not think the facts necessitated the closing of the mints?—That was my impression.

11,139. Is it your opinion that the Government acted wisely in fixing, in the arbitrary way they did, the rate of exchange at 1*s.* 4*d.*?—I hardly think that upon that point my opinion would be of very much value. I understood that that had been about the average, and that they took it as the average, and that does seem a strong argument, but I do not think my opinion on that point would really be of much value.

11,140. Are you of opinion that it is desirable in such a country as India that the rate of exchange should be allowed to fix itself automatically?—Yes, I think that is very desirable.

11,141. Then, if that is very desirable, you would hardly approve of any means by which, in an arbitrary way, the rate was fixed, and was not left automatic?—I have already said that it was on that ground that I disapproved of the closing of the mints, but, the mints having been closed, I think the Government must take the responsibility in the matter.

11,142. Your own view would be, apart from the difficulties of the situation, to have the mints, as early as it could possibly be done, re-opened?—I think it would be extremely desirable, and it was with that object that I have made some suggestions which I should not recommend in themselves. I think they are an evil in themselves, but I recommend them in order, as soon as possible, to get rid of what seems to me to be a greater evil.

11,143. Then, in your judgment, the internal trade of such a country as India is more important than the external trade?—I think so.

11,144. We have had various ideas from witnesses as to whether or not the currency was redundant or deficient. We have had it in evidence that the Bank of Bengal rate was as high as 12 per cent. last season, and in Bombay the nominal rate was 12 and 13 per cent. We have had it in evidence that Parsees went to the manager of the Bank of Bombay and asked for advances on Government paper, and he said: "I can-"not give it you either at 12 or 13 per cent." "But," they said, "we must have money to meet our engage-"ments, and we would give you any rate you choose "to name to us up to 18 per cent."; and he said, "It is not a matter of rate, I have not the rupees, I "cannot do it." Then the reply was, "Well, we "cannot meet our liabilities; it is a very serious "position for us." Is it your opinion that in such a state of matters the currency could be called redundant?—Not at that place, and at that moment. I read that evidence with a good deal of surprise, and I observe that no statement was made as to how long that very high rate was maintained. We have all known cases of high rates in London, and much higher rates in New York, but it has only been for a very short period. In New York the rate is occasionally very high indeed for a few days, and it may have been something of that kind in the case you refer to. That is one of the evils I referred to. The Government having fixed the maximum, when the rate of exchange approaches that, anybody with free money feels that the rate cannot go any higher and that he may save himself a loss by remitting it, and, therefore, it tends to produce an artificial stringency. I also think that these facts illustrate the inconvenience of having a currency which is not automatic. The Government then has to decide, and it is very difficult for them to decide, whether the facts are such as to justify them in increasing the coinage, or whether the difficulty is only temporary; whereas, if the country has an automatic currency, the Government has not to interfere in that way at all.

11,145. (*Sir F. Mowatt.*) And the Government would have been bound to produce the rupees if the sovereigns were brought to them; therefore the deficiency is rather in the capital than in the currency?

—That is one reason why I suggested that the extremely high rate was perhaps only temporary.

11,146. (*Sir J. Muir.*) Unfortunately it continued during the greater portion of the heavy shipping season?—Then, I am surprised that nobody tendered the gold and demanded rupees, if they knew that it was going on so long.

11,147. You disapprove of melting down rupees?—Yes, I think that is undesirable.

11,148. That would be sure to entail a very heavy loss which there is no occasion for?—It seems so to me.

11,149. Then your opinion, if I understand you aright, is that the land rent might equitably be increased to the extent of the fall of the rupee?—I do not think it would be equitable for the Government to go to any particular landowner and make a difference in his contract. The contract was a contract. But I think it is always open to a Government to say, "We must raise an additional amount of taxation and "we must consider how we can best raise it so as to "create the least inconvenience," and if they thought that the best way of raising it would be by a tax upon land, it seems to me that they would be entitled to impose that taxation. Whether it would be wise or not is a totally different thing. But then it would be a tax upon all land, which is a very different thing from making a difference in the case of particular landowners.

11,150. I am not sure whether you are aware that all over Assam and large districts where tea is grown we get a settlement for 30 years, the Government reserving the right at the end of the 30 years to make a fresh assessment. You, I think, understood, and you are quite correct, that these leases are falling out year after year, more or less. You think it would be a reasonable thing to increase the assessments, bearing in mind to some extent the fall of the rupee?—Yes; I think where the rupee had fallen it would be reasonable to increase the assessment of the land, other things remaining equal. I suppose that would be one of the elements which those who were responsible for the reassessments would take into consideration.

11,151. The only restriction that we have in regard to our tea planters is that they will not assess us at a higher rate than rice lands in the neighbourhood. Are you aware that the chambers of commerce in the great cities, Calcutta, Madras, and Bombay, object strongly to the proposals of the Government of India. You have noticed that, I daresay?—I observe that they object to some of the proposals, at any rate.

11,152. We have had a number of witnesses before us who are interested in such productions as indigo, tea, coffee, &c., and who complain very bitterly that they are subjected to a heavy loss by the difference in the rate. They have to lay down funds in Calcutta to pay for the wages of their coolies, and, supposing the rate is 1*s.* 1*d.*, they will get far more rupees for every 1,000*l.* that they sell in London at 1*s.* 1*d.* than at 1*s.* 4*d.*, and this 3*d.* in the rupee comes to be a very heavy percentage of loss to them. I do not know if any sort of suggestion may have occurred to you whereby this difficulty might be got over. It is one that presses very hard upon all growers of indigo, tea, coffee, wheat, &c. Did you read Mr. Ralli's evidence?—I read Mr. Ralli's evidence. The great majority of the companies that he refers to, I think, were formed when the rate of exchange was higher than it is at present, and it hardly seems to me, therefore, that they can complain, because they are better off now than they were when they were formed. Some of the remaining companies have been formed—and, apparently, very successfully formed—since the Indian Government announced their intention of doing their best to keep the rate at 1*s.* 4*d.* I scarcely think that those who have had notice of it have a right to complain. The companies that were formed between those two periods are, I think, very few in number. You know more about that than I do. There is no doubt that, the lower the rupee, the better it is for those who pay wages in rupees, but I can hardly think that that will be a permanent advantage. If you pay the wages in rupees which are worth less, by degrees the number of rupees which you will have to pay will become more.

11,153. Did I understand you to say that you considered there was no occasion for the closing of the mints, and that the Government of India might have found some other means of meeting their expenditure than closing the mints and raising the rupee to 1*s.* 4*d.*?—The Committee will understand that on a point of that sort I should really wish to speak with the greatest possible diffidence. Naturally, the Indian Government had sources of information which are not open to us. But, looking to the fact that the rate of exchange at the time the mints were closed was, I think, 1*s.* 2¾*d.*, and that an import duty of 6*d.* an ounce would have been equivalent to nearly 2½*d.* in the rupee, and would have brought in 800,000*l.* in money, and that a seignorage of 1*d.* again would have brought in another sum, if you take the present intrinsic value of the rupee at 11*d.* you would have had the seignorage of 1*d.*, which would have brought it to 1*s.*, then 2½*d.* in the rupee would have brought it to 1*s.* 2½*d.*, and the difference between that and 1*s.* 2¾*d.* was, of course, only ¼*d.*, which would have been more than covered by the amount which would have been brought in by an import duty on silver. Although I admit that the imposition of such a heavy seignorage as 1*d.*, and an import duty upon the standard metal, are undesirable in themselves, I confess I should have thought that it was a lesser evil than the very grave step of closing the mints.

11,154. With regard to imposing a duty on silver, have you considered what might possibly be the rate of exchange if the mints were re-opened?—Yes, I have considered what the effect of re-opening the mints would be if nothing else were done. My impression is, as I said in answer to the Chairman, that there would be so great a fall that the Indian Government would not be wise in taking such a step.

11,155. Granting that, what do you fancy the rate would fall to?—Speaking very roughly, I estimated the effect of opening the mints as being about 2*d.* You would add that on to the present intrinsic value; but, as I began by saying, that is a matter on which one cannot express a strong opinion. I have a very strong opinion that it would raise the value of silver, but, when one is asked how much it would raise it, that is, of course, a point on which one can only express an impression.

11,156. You put the intrinsic value at 10*d.*, and you would add 2*d.* to that, that would make it 1*s.* Your opinion is that, apart from anything being done, that might be about the rate—2*d.* above the present intrinsic value?—Yes. I think if you were to open the mints now, and do nothing else, it is extremely likely that the rupee would then fall to 1*s.*, or thereabouts.

11,157. You would not expect it to fall below that?—I have said that I thought it might be about that. It would depend on so many considerations that it is difficult to form an opinion upon a point of that kind.

11,158. (*Sir A. Dent.*) The only question I want to put to you is this: Supposing your scheme of adding 6*d.*, or 25 per cent., to the silver duty were carried out, what effect do you think that would have upon the natives of India who are accustomed to use silver so very largely in all operations?—In the first place, I think there is considerable difference between putting on 6*d.*, and putting on 25 per cent. I should prefer to put it in the form of a fixed 6*d.*, because I do not wish it to vary with the price of silver. But, in answer to your question, I should say that, as regards the natives of India, after all, they would only be giving the same price for silver to which they were accustomed, and even less than they used to give; and, again, silver is not a necessity of life; it is, after all, used for ornaments and luxuries to a great extent, and I think, if you are going to raise money, it is desirable to tax the luxuries and conveniences rather than the necessaries of life.

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

11,159. Do you not think it would be almost a prohibitive duty, at first, at any rate?—I do not think so, because the imports of silver were very large formerly, when the price of silver was much more than it would be even with the 25 per cent. import duty. If it did not diminish the importation of silver, it would bring in some 800,000*l.* I suppose it would diminish the importation of silver, but to that extent it would benefit the Indian Government by increasing the demand for Council Bills.

11,160. Then there is a very large export trade from India of silver. India exports silver to a variety of places. Would it not check that trade altogether?—I suppose, in that case, the silver that merely went to India for transmission would be put in bonded warehouses. The Indian Government, I suppose, would hardly impose an import duty on silver which was not going to remain in India. But, taking the balance, there is always an import of silver into India; at least, I think I am correct in saying so.

11,161. Of course, there would be no duty charged on silver that went straight to the mints for coinage purposes to be passed on to Singapore and China in the form of dollars. But I take it that there is a large general trade?—There would be no duty on silver, of course, that was imported by the Government; but silver that was imported for minting purposes by anybody else——

11,162. That is held in bond. I think the British trade dollar that is coined in Bombay is held in bond, and there would be no duty there; that goes to China and Singapore; but apart from that there is, I understand, a considerable export trade in silver from India to various places. Surely your proposal to add a duty of 25 per cent. would strangle that silver trade?—I am afraid it is impossible to raise any additional amount of taxation without interfering with some trade. You have to choose the lesser of two evils. As I have already had the honour of mentioning to the Committee, it seems to me that the three advantages which you would gain would be, in the first place, a considerable increase of revenue; in the second place, you would tend to increase the demand for Council Bills; and, in the third place, you would diminish the difference which now exists between the price of uncoined silver and the rupee, which, I am afraid, may give rise to a considerable amount of dissatisfaction in India, and I think it would also make it rather more difficult to have false coining.

11,163. Then you are not afraid that a duty of 6*d.* an ounce would have a very bad reception in India at the hands of the natives, as interfering very much with their trade in silver and silver ornaments?—I should think that, on the contrary, it would be popular with the natives. I have no doubt the Committee have seen an article by Professor Ghose; I think it was in the "National Review" of last year, in which he expressed (in language, I think, far stronger than the circumstances justified) the belief that the natives of India had been cruelly treated by the Government, because they had laid by silver which they might use in case of illness or calamities of any kind, and the Government by an arbitrary exercise of their power had raised the value of the rupee, and thereby *pro tanto* diminished the value of the silver that they had laid by to meet an evil day. I do not think the accusation was justified. At the same time, I do think that there is a certain ground of complaint, which may be to a considerable extent diminished by the course I have ventured to suggest.

11,164. A duty would possibly be popular amongst those who happen to hold the silver, but I am thinking more of those who have not got the silver, and who want to conduct their business in the usual way?—I have always understood that a very large part of the population of India held a little silver in the form of bangles and other ornaments, even if they have no coined silver. Those who have not silver at all would not be at all affected, because, if they give more for the silver on the one hand, they would buy more with the silver on the other. It would be as broad as it is long for them, except that they would have to pay a little more for their ornaments.

11,165. (*Mr. Campbell.*) As regards the question of convertibility. Assuming that you consider absolute convertibility a thing to be aimed at, do you think that, in making a change such as we have under discussion now, unlimited convertibility is a necessary or desirable thing at the outset?—May I ask what you mean by "convertibility"? I do not think I have used the expression.

11,166. I mean the Government undertaking to give gold for rupees?—You cannot be said to have a gold standard unless the rupees are convertible into gold; but I have been rather venturing to argue against a gold standard.

11,167. Gold and silver being both unlimited legal tender, would you consider it a desirable thing that, at the outset, in making the change, the Government should announce at once that they will convert rupees into gold for anybody who desires it?—No, I think I have expressed, more than once, my opinion that the Indian Government were quite wise in not undertaking that responsibility; but, if you will allow me, I never expressed the previous opinion that you attribute to me (nor is it the case), that gold and silver are both legal tender at present.

11,168. I mean, supposing you were to make both of them legal tender?—That is bimetallism, and upon that I have been asked no questions.

11,169. You do not say that France is bimetallic, and gold and silver are legal tender there?—Not in the sense in which bimetallists use the expression, because you cannot take silver to the mint and have it coined. The sense in which bimetallists use the expression is that you are to be able to take both gold and silver to the mint and have them coined. In that sense, France is not bimetallic at present.

11,170. But that is not the scheme of the Indian Government. The scheme of the Indian Government is to close the mints to silver, and to make silver and gold legal tender on a ratio of 1*s.* 4*d.*?—When you ask me about bimetallism, I wish to point out that I thought the term was being used in the sense in which bimetallists understand it. I am quite aware that the Indian Government have not proposed bimetallism.

11,171. I suppose, in the question of convertibility, there is in your opinion, a great deal of importance to be attached to the settlement of the foreign exchanges?—"Convertibility," as you use the word, would mean bimetallism, would it not?

11,172. What I mean is this: If the balance of trade is against a country, and she has to settle in gold, it would be desirable, under the Government of India's scheme, that gold should be obtainable for the purpose of keeping the foreign exchange from falling below the gold point?—That is one reason why it is so important to a country to have a currency which is really circulating at its intrinsic value. That enables you to meet a drain from a bad harvest or any other cause; whereas, if you have what I have ventured to call an exchange standard, you may have no metal circulating in the country which you can use in that way.

11,173. I think you said that the Bank of France regulates the foreign exchanges, so that it does not depart very far from the gold point?—From the £ sterling—not exactly from the gold point; I must put it a little more definitely. They regulate the currency so that it shall have a certain reference to the English £ sterling, which I ventured to think was rather a proud position for this country to occupy.

11,174. I daresay you are aware that the balance of trade is always in favour of India—that the years in which the balance of trade is against India are very exceptional?—That is so. In other words, that India is nearly always importing the precious metals.

11,175. That being so, and so long as it is so, the question of the precious metals for the settlement of an adverse balance is one that occurs very rarely?—

I think in any country it happily is only likely to occur rarely, because it would only come into operation in the case of a very deficient harvest or some other circumstance, which would upset your calculations.

11,176. But, if the balance of trade is so generally in India's favour, is not the question of convertibility of the internal circulation of minor importance? You say very properly that the internal circulation of India must be, for some time to come at all events, in rupees. Is the question of convertibility as regards the internal circulation of such very great importance as to make it essential that the Government should declare their intention to exchange 15 rupees for a sovereign to anyone who wants it?—I venture to think that it was rather a mistake to do so, that fixing the maximum, and not fixing the minimum, has had the effect that, directly the exchange comes near the maximum, everyone who has loose capital feels that he had better withdraw it, because if he leaves it in India he cannot gain, and on the other hand he might lose.

11,177. Is it essential for the Government of India to say that they will guarantee absolute convertibility? Might they not leave it optional as is the case in France?—If by convertibility you mean convertibility of rupees into gold, the Indian Government have, as it seems to me very wisely, declined to undertake so great a responsibility. So far as it is convenient to have say 10 or 20 millions in gold coins for larger transactions, that might be done; but that is not having a gold currency. I would rather leave India with a silver currency, and re-open the mints as soon as circumstances render it possible to do so, and take such steps as might be possible to bring that desirable event as near as might be.

11,178. Then you say the Indian Government have pledged themselves to do their best to maintain a ratio of 1*s.* 4*d.*?—I have understood so.

11,179. Are you not aware that, when the mints were closed, the final rate to be adopted was expressly left an open question?—I understand that that is so.

11,180. It was left as a question to be decided afterwards according to the light of experience?—Yes, I think that was so, but I understand that since then they have committed themselves as far as possible to maintain a rate somewhere approaching to 1*s.* 4*d.*

11,181. You know that there was no pledge?—As to what the pledges are, or what is the position of the Indian Government, the Committee will of course get that from the representatives of the Indian Government. I think that the general feeling in the mercantile community has been that the Indian Government had expressed their intention of maintaining the rupee at about 1*s.* 4*d.*

11,182. (*Chairman.*) The proposals that they have sent home, the proposals before this Committee, say 1*s.* 4*d.*?—Yes.

11,183. (*Mr. Campbell.*) I asked the question because I think that in your paper you used the expression "breach of faith" in regard to any departure from 1*s.* 4*d.*?—I do not think I used the expression "breach of faith." Certainly not in that context. What I intended to say was, as the Chairman has just said, that the Indian Government had expressed their intention of keeping it at about 1*s.* 4*d.*, which, of course, implies that there might be small fluctuations.

11,184. With the open mints and the heavy seignorage you speak of, you think exchange would be kept up to about 1*s.* 4*d.*?—I think it may be. As I have already said, it depends very much upon the relative production of gold and silver in the future; that I do not think anybody can prophesy 10 or 12 years ahead.

11,185. You do not pretend that it would make a stable exchange?—No, but I think it is quite as likely that the instability may come from a change in the value of gold as from fluctuations in the value of silver.

11,186. In that event the exchange would fluctuate just as it fluctuated in previous times?—Just as it fluctuated in previous times before the great fall of silver. There was no extreme inconvenience until the time came when silver dropped very much in price. Up to that time there were, no doubt, fluctuations in exchange, but they were fluctuations in exchange such as occur between this country and almost any other country.

11,187. But your proposals would not do anything to obviate the fluctuations of exchange according as silver rose or fell?—I had the honour some years ago of serving on the International Monetary Commission. We took then a great deal of evidence with reference to the fluctuations of exchange, and the idea was that it would be extremely desirable to make some arrangement with foreign countries which would prevent fluctuations of exchange; but we found that, if you were to-morrow to have a gold coin, say in Germany, France, and England, which would be issued of the same fineness of metal and exactly the same weight, that would not at all prevent fluctuations of exchange. The actual value of the coin as it came from the mint might be identical—coined of the same fineness and of the same weight—and yet it would not prevent fluctuations of exchange. Fluctuations would arise partly from the fluctuations of commerce, partly from the conditions under which the coins were withdrawn from circulation as they became worn. If you have two countries both issuing coins exactly of the same weight and of the same fineness, which were worth exactly the same when they were issued, and if one of those countries has arrangements, as we have here with our gold currency, under which directly a coin becomes worn it is almost automatically withdrawn from circulation through the Bank of England, and if the other country allows the coins to go on being used, as France does, long after they are very much worn, you would very soon have a difference in the value of those coins, although they were at first identical.

11,188. It would mean a much larger difference than the cost of sending them backwards and forwards?—Yes.

11,189. But would you compare that with the fluctuations between a gold standard and a silver standard country?—No; because, as I said previously, you are now mixing up two things; you are mixing up the exchange which can only vary by the expense of sending the metal from one country to the other, and the difference which may arise from a fall of one metal in relation to the other. But unfortunately, in so many of these matters of currency and commerce, we use the same word in ordinary conversation very often to mean different things, and we fail to make ourselves clear, because we are really speaking of two different things under the same term.

11,190. I notice, when you speak of the circumstances which would suffice to keep exchange at 1*s.* 4*d.*, you include a rise of silver, due to the re-opening of the mints, of about 10 or 15 per cent.—1¾*d.* per rupee?—That is so.

11,191. But you indicated that the heavy import duties might diminish the demand for silver in India?—I think the universal experience of taxation is that, if you put a new duty on any article, or increase the duty, you diminish the importation.

11,192. The importation will decrease owing to the rise in price. Might not that counteract the effect of the re-opening of the mints in raising the price?—I think not, because, to whatever extent it diminishes the importation of silver into India, it would increase the demand for Council bills. Council bills and silver are the two rivals as it were, and if you diminish the one you tend at least to increase the other.

11,193. Then would you consider that this effect would be so certain as to obviate any possibility or probability of the exchange question cropping up again through another heavy fall in silver?—As long as you have any article as the standard of value, gold

Rt. Hon. Sir J. Lubbock, Bart, M.P.

1 Dec. 1898.

or silver or anything else, you are liable to fluctuations. There is nothing which does not fluctuate in value, and gold and silver have been chosen because they fluctuate in value less than anything else. Theoretically, I think one of these days we shall come to a standard of value which will be composed of many items. There you would have, of course, less chance of variation than you have as long as you have one single substance. My great objection to the suggestion of the bi-metallists has always been that I venture to think that what they call bi-metallism is not really bi-metallism. What they call bi-metallism is giving one party to a contract the option of paying either in one metal or in another, which gives him an advantage, whereas true bi-metallism, I think, would consist of saying that, whatever your designation may be, it should consist of a certain quantity of gold and the same quantity of silver; then in any variation it would be the same for the debtor as for the creditor, whereas, if the debtor has the option as to the metal he is to pay in, he would be at an advantage. That is not strictly bi-metallism at all, although it is what is officially known as bi-metallism because it is the sense in which bi-metallists use the term.

11,194. In one of your replies you spoke of the fact that an import duty of 5 per cent. already existed. Of course, under existing circumstances, silver is only a commodity, just the same as copper, or iron, or Manchester goods, or any other article that India imports?—That is so.

11,195. It is not currency at present?—No, it is not currency till it is coined.

11,196. Do you approve the principle of Government taxing a country's currency?—No; I think I have already said that, theoretically, it is undesirable, but we had to deal with a certain state of things. We had to choose what was the lesser evil under the circumstances. It was only from that point of view, and having regard to the circumstances, that I have suggested it.

11,197. Could you conceive of any circumstances which would induce you to advocate an import duty and a seignorage amounting to about 26 per cent. on gold in this country?—The circumstances are very improbable, but I could imagine such circumstances.

11,198. (*Mr. Le Marchant.*) Would the exchange value of the rupee under the conditions that you propose follow silver exactly in its fluctuations? Would there be any element to cause the fluctuations of the rupee to differ from those of silver?—I think there would be some elements which would prevent its fluctuating exactly as silver, but it would fluctuate much more nearly with silver than it does at present.

11,199. Would not a given weight of silver still be coined into a certain number of rupees, just as at present, so that, if the sterling price of silver altered, exactly the same alteration would take place in the value of the rupee? Would not the variations in pence, or fractions of a penny, be the same under your system as with open mints?—What I have suggested would certainly not prevent fluctuations, but it would tend to maintain the rupee at a considerably higher value than the mere intrinsic amount of silver in it.

11,200. And, to the extent of that fixed difference, India would not be upon exactly the same basis of value as other silver-using countries?—If you mean the advantage which a producer in China has over a producer in India, I think that, after all, though that may go on for some time, it is really a temporary advantage.

11,201. Do you consider that there would be advantages in being on a common basis with gold-using countries?—Other things being the same, I think there would be; but the reason why I do not think it would be convenient in the case of India, is that experience, I think, has shown that a currency of which the great bulk consists of silver is that which is really convenient for the requirements of the people of India.

11,202. How far would your system be automatic? I can understand that silver would flow in under certain circumstances, and be coined and increase the currency; but how far would your system be automatic in the way of providing for an out-flow?—No system would be automatic, I think, until the mints were opened; but the course I have ventured to suggest would make it much easier to open the mints, and might make it possible to open the mints when it would not be possible under any other circumstances; and, of course, as soon as the mints were opened, it would be automatic.

11,203. As a step towards opening the mints, would you propose to reduce the duty if the sterling value of silver rose?—Reducing the duty would not be a step towards opening the mints. The expediency of reducing the duty would depend on many contingencies. If silver rose so that the rate would be maintained at about 1*s.* 4*d.*, even without the import duty on silver, and if the Indian Government could spare the revenue, then I would say, reduce the import duty; but, on the other hand, if the Indian Government really require revenue, I do not know any way in which something like a million of money could be obtained so easily as by an import duty on silver and gold. I think it has been clearly shown in the evidence given before this Committee, and in other papers, that there are very great difficulties in raising other taxes in India. I alluded to the land tax; but although I think it might be equitable and just to raise the land tax under certain circumstances, I am perfectly well aware of the grave political reasons which make it undesirable to do so.

11,204. Whenever steps for removal of the duty were taken, would not that involve a sudden change in exchange values? For instance, so far as the charge of 6*d.* operated to maintain the value of the rupee above the commodity value of silver, would not the removal of the charge cause a sudden alteration?—I do not suppose that any Indian Chancellor of the Exchequer would make a sudden change of that kind. He would probably do it by degrees. If he found that he could do without the revenue, and if he found that it was not necessary for the purpose of maintaining the rupee at a steady exchange, he would say "I advise the Government to lower the duty to 4*d.* or perhaps 3*d.*," and then he might reduce it again, and so on. But the great desire, I understand, of the Indian Government is to have a rupee which would be approximately steady in value.

11,205. Would not such a system of varying the duty introduce a great deal of what has been called "management" into the relations of the Government to the currency, and bring into trade an additional element of uncertainty?—Not, I think, to anything like the same extent as the present system. Whether the duty was to be altered or not would involve the same considerations as whether, for instance, the tea duty should be altered here or not. That would be done by the Chancellor of the Exchequer with the consent of the Government, and so on, and it would be done probably once for all; whereas this question of maintaining the relative quantity of rupees is a question which is continually before the Government, which I think is much more difficult of solution. You can determine whether you can spare a certain amount of revenue; but where you have to determine whether the rupees at any given time are redundant or deficient, we have already seen, and this Committee has seen, what great differences there may be between gentlemen who are very qualified to speak, and who yet come to hold totally different views.

11,206. Any system under which the Government had to determine how much duty to impose, or to remove, in order to regulate the exchange value of the currency, would create serious uncertainty as to the future course of exchange?—No, I do not think that necessarily follows. I understand, and I think the Chairman has confirmed me, that the Indian Government have now expressed their intention of keeping the rupee at about 1*s.* 4*d.* As long as they do that, the public, I think, will feel confidence that they will, as far as they can—of course, circumstances may

render it impossible—endeavour to do what they have announced their intention of doing, and the longer the rate is maintained the greater confidence the public will feel. For instance, the case of France has been very often referred to. I do not know that there is any absolute reason why the Government of France and the Bank of France should not alter their policy to-morrow; but all those engaged in the commerce of France feel that there has been a certain policy pursued for many years, and confidence has gradually grown up, and so I think it would in the case of the Indian Government.

11,207. Therefore, although the proposal is to fix the duty at, say, 6*d.*, it would be understood that this might be varied if opportunity arose?—It is always a well understood principle in politics that it is open to the Government to alter the duties imposed on any article.

11,208. And you would put the currency in this case in very much the same category as other articles?—In this case, yes; having regard to the necessities of the situation; but I think I have already said more than once, and perhaps I ought not to repeat it again, that as a general rule to put a duty on a metal which is the principal article of currency is in itself very undesirable.

11,209. In 1892 you contemplated, I believe, a seignorage of 10 per cent. as advantageous to India?—Yes, and an import duty. I have long been of opinion that under the circumstances of India an import duty and a seignorage were perhaps desirable.

11,210. The seignorage would have been a percentage and not a fixed sum, would it not?—I should on the whole rather lean to a fixed sum.

11,211. (*Chairman.*) It is one penny in your present scheme?—Yes.

11,212. (*Mr. Le Marchant.*) In discussing the term most appropriate for describing a standard, I think you said that the term "gold standard" would not be correct if the volume of rupee currency were large?—I think if you were to tell a person that the standard in India was a gold standard, and then he found his debtor was entitled to pay him in silver, he would be somewhat surprised.

11,213. In speaking of paying in silver, do you have any regard to the fact that the coinage of rupees is limited?—Certainly. That makes a material difference; directly you limit the coinage, you introduce an element of very great difference. Then I think the principal inconvenience is the want of elasticity, and the great responsibility it throws on the Government; but, so far as the relations between debtor and creditor are concerned, of course it is materially altered by the fact of the mints being closed.

11,214. Under a gold standard with a relatively small gold currency, the level of prices might be the same as that which would prevail if the currency were mainly in gold?—I think so. Prices by degrees would conform themselves to the 1*s.* 4*d.* standard.

11,215. I think you were mentioning that you considered prices had been affected by the closing of the mints, and the exchange value of the rupee seems to indicate that?—I think so. If you contrast the Indian ryot with the English farmer, the English farmer has paid his rent with gold, which has not fallen in value, and he has got very much lower prices for his produce. The Indian ryot, on the other hand, has paid his rent in a coinage which has fallen in value, but, as the produce has also fallen in value to about the same extent, the price of produce estimated in currency has remained about the same. Of course, latterly it has gone up, because the currency has fallen rather more than the produce.

11,216. If you regard prices as having adjusted themselves to the rate of 1*s.* 4*d.*, what further test could there be of the possibility of establishing that rate; in other words, is not the adjustment of prices to 1*s.* 4*d.* the main condition requisite for an exchange rate of 1*s.* 4*d.*?—When the Government has announced that they were going to maintain the rate at 1*s.* 4*d.*, which I understand they did announce, because it had been the average rate for some time previously, I think, then, it is desirable to endeavour to adhere to it.

Rt. Hon. Sir J. Lubbock, Bart., M.P.

1 Dec. 1898.

11,217. What test would you look for to prove whether such a rate is feasible?—My own impression is that it is perfectly feasible, and that really no extreme or stringent measures will be required. I agree with Sir James Mackay on that point. You will remember that on the Gold and Silver Commission we recommended that the French and the United States' Governments should be approached with the view of keeping their mints open, and that, if they did, we should keep open the Indian mints. I agree with Lord Rothschild that it is a pity that those negotiations were so abruptly closed. It would certainly facilitate the opening of the Indian mints if the French or the United States, or both of them, would re-open their mints.

11,218. Apart from any extraneous conditions of that kind, what would afford an index of any one rate being a reasonable one?—If you ask me my opinion about the question whether currency is redundant, it seems to me that the value of the currency depends on the quantity and on the work it has to perform. The present currency is about that which will support a 1*s.* 4*d.* rate, and, as the tendency of all currency is gradually to be destroyed, worn, absorbed, lost, and so on, I think that, as the Indian Government have now attained to a rate of approximately 1*s.* 4*d.*, they will be able to maintain it, if they adhere to their present policy. But one must always speak with a great deal of doubt and hesitation on questions of that kind.

11,219. You were alluding to a remark made in previous evidence, that it was desirable that more encouragement should be given to private capital to flow into India for railways and other works?—I think, if the Government of India were not to undertake [railways themselves, but were to offer reasonable encouragement to private enterprise, many more railways would have been made in India, and that would have opened out the country. The Government themselves would have had a smaller amount to pay here, and their taxation would not have been absorbed to the extent it is by having to make payments on account of the railways. The effect of the Government making some railways is practically to discourage private enterprise from making any others, because the effect on the public mind is that, if you put forward any proposal to make a railway in India, the public say, and, I think, not unnaturally, "if this had been likely to be a paying line the "Government would have made it, and as they do "not think it likely to pay, we would rather not risk "our money in it." It is certainly a very remarkable thing that, whereas English capital has gone largely to make railways in Argentina and elsewhere, and is now ready to do so in China, there is very little disposition to embark in Indian railways. I agree with Lord Rothschild as to the line which the Indian Government have taken with reference to railways.

11,220. (*Mr. Hambro.*) You said that elasticity of the currency was a great advantage?—I think so.

11,221. Suppose your system to go through, and the mints to be open, I see that there would be elasticity in respect of increases of the currency, but I do not see how the other operation would be affected, because silver cannot be exported without a loss, owing to the duty or seignorage?—No doubt that is the case.

11,222. Now I should like to ask you this: We have been told that going on a gold basis at 1*s.* 4*d.* would be very detrimental to India as compared to silver-using countries. I do not lay down as a fact that it would be, but that is what we are told. It would be the same under your system as far as the duty and the seignorage are concerned, but, besides being a disadvantage, if it is a disadvantage, to silver-using countries, it would also be a disadvantage to gold-using countries, would it not?—No doubt, as long

Rt. Hon. Sir J. Lubbock, Bart, M.P.

1 Dec. 1898.

as those who have capital in India, and who have borrowed money, can pay that money back in depreciated currency in a currency which has fallen—as long as they can pay their wages by a rupee which is worth less than it was before, they would, for a time, have an advantage, but I think that is only a temporary advantage; and, of course, that disadvantage, if it is a disadvantage, is a disadvantage which arises from the 1*s.* 4*d.* rupee. It is no disadvantage arising from the course which I have ventured to suggest.

11,223. I should like to ask one more question. You know that those who last regulated our currency came to the conclusion that a certain amount of bank notes could never be presented. Considering the enormous population and extent of India, do you not think that out of the 130,000,000 of tens of rupees which there are in India, an enormous number of those could never be presented for conversion into gold, if India went on to a gold standard?—Certainly a very large amount must remain in circulation.

11,224. Can you give any idea of the amount by which the currency of India could be reduced without the money market getting so tight that they would want more currency?—That is very difficult to say. One of the difficulties of the Indian currency has arisen from the fall of silver in relation to gold. The course which the Government are proposing to pursue would tend to aggravate that still further.

11,225. I am suggesting at the present moment that the rupee is only a token coinage, or a silver bank note, if you like. I am speaking of it, not as the metal, but as a circulating medium, as a silver note of the Government, if you like to call it so. How many of those could be presented to be turned into gold without money getting very tight again?—It would want someone with more experience of India than I can pretend to possess to form an estimate of that. Mr. O'Conor could give you far better evidence of that than I can.

11,226. It is, no doubt, a very difficult question, but the extent to which the currency can be reduced, and yet the trade of the country go on, that is the total extent of the amount of gold that could ever be asked for from the treasury, is it not?—No, I think it might be a great deal more than that, because a good deal of silver might come in, and gold might be taken for it, which might be still used in the currency.

11,227. It is a question of the amount of small currency which is necessary for the use of the country; the number of rupees which are necessary for the use of the country?—I have no doubt the number of rupees which would be necessary would always be large, and nothing like the whole amount could come in. But there seems reason to believe that uncoined silver is beginning to be used in the bazaars.

11,228. We have had it suggested to us that not more than the equivalent of 15,000,000*l.* sterling could come in?—I cannot imagine that. If you open the mint and undertake to give gold for rupees at 1*s.* 4*d.*, I think you would find a great deal more than that—double or treble that, and perhaps even more.

11,229. The suggestion was that, if more than the amount which I have suggested were presented, there would not be enough silver in the country for the requirements of the people?—I should have thought it might have been much more than that, but it would depend very much upon what the production of silver in the world was.

11,230. I do not see, if silver is a token coinage necessary for the use of the people, and the mints are not to be open to silver, how the production of silver in the world affects that question?—But the mints are to be opened to gold.

11,231. Yes, but not to silver. Would that affect the question of the necessity of small change?—It is possible you might have a circulation of gold in India which might replace, to a very considerable extent, the present circulating medium. If you tell me that is impossible, then it would follow that a gold currency is impossible in India.

11,232. Do you mean that gold might take the place of rupees for circulation purposes, or for hoarding purposes?—For circulation purposes, if you include the balances held in the banks and by merchants and so on. I have no doubt that a large amount of silver circulation would always remain in India. I have rather gone from the beginning on the assumption, on the authority of the Indian Government, that it would not be safe to offer to give gold for silver.

11,233. I was wondering whether you had any idea how much could come out of the pockets of the people, and yet trade go on?—I do not think the total circulation of the country is likely to be much reduced beyond what it is at present, nor, on the other hand, to be suddenly increased, so that, if you are going to issue any large amount of gold, then I think you must be prepared to sell the corresponding amount of silver, or nearly so.

The witness withdrew.

Mr. H. Bois.

Mr. HENRY BOIS called and examined.

11,234. (*Chairman.*) You are a member of a Ceylon firm?—I am a member of the firm of J. M. Robertson & Co., of Colombo. I was formerly a member of the Legislative Council of Ceylon, and Chairman of the Chamber of Commerce of Ceylon.

11,235. How many years did you reside in Ceylon?—Off and on for nearly 40 years. It is 40 years since I first went there.

11,236. You are familiar by personal experience with the trade of Ceylon during that time?—I am.

11,237. And I suppose especially with reference to the development of the tea trade?—Yes.

11,238. Have you read the evidence that Mr. Christie gave before us?—I have.

11,239. Will you tell us generally where you concur and where you disagree with him?—I concur with him as to his statistics, and where his evidence relates to questions of fact. I do not altogether concur in his opinions or in the remedy which he suggests.

11,240. Now will you tell us where you do not concur in his opinions; on what point will that be?—There is one particular point in which he was asked what would happen if the value of silver were to go down to 6*d.* an ounce. This is at question 4573: "(*Q.*) "Even if silver went down to 6*d.* an ounce?—(*A.*) "Even if silver went down to 6*d.* an ounce, or if it "went up half as much again." I do not agree with that answer for this reason; while I consider that the appreciation of gold relatively to silver has, so far as it has gone, been an advantage to India and to Ceylon, and, while I do not think that there is any probability of its appreciating to a point at which it would cease to be an advantage, I still admit the possibility of the rupee becoming depreciated, not only relatively to gold as at present, but also relatively to food, labour, and commodities generally. In that case the advantage at present enjoyed by India and Ceylon from a low exchange would be lost.

11,241. That is your opinion?—That is my opinion.

11,242. Now is there any other point on which you differ from him?—There is no other particular point.

11,243. You do not agree with him as to his proposed remedy. I think he recommended the re-opening of the mints, concurrently with the imposition of an import duty on silver and a seignorage. Where do you differ from him on that point?—I differ from him in this: I think that, whether you pay an import duty on silver or a seignorage at the mint or a land tax, or artificially raise the rupee, or put on an export duty, eventually the deficit is paid out of exports; and, if so, I think it is preferable to put a

direct duty on the exports, rather than raise the money in the other ways that I have described.

11,244. Even where the subject of the export duty is an article in which there is competition with some other country?—Yes, because it already pays it, and it pays it in much larger proportion. The effect of raising the rupee has been this, that the Indian Government have practically taxed all the exports, valued at about £66,000,000, to the extent of 3*d.* in the rupee—taking the relative exchanges at 1*s.* 4*d.* and 1*s.* 1*d.*—in order that they may recoup themselves to the extent of 3*d.* in the rupee on £16,000,000.

11,245. That is not an answer to my question. Let me take the article tea. The Indian tea grower is in competition with China in the London market. Suppose an export duty was levied on the tea exported from India, and no export duty was levied on the China tea, what would be the position of the two teas in the London market?—I would say that any tax handicaps production.

11,246. But an export duty stands out by itself, and I want to deal with that?—An export duty I consider would be a much less onerous burden than the tea grower now pays by having a fictitious rupee.

11,247. But who would pay the export duty?—The producer.

11,248. Do you contend that, supposing the price of tea were raised in the London market 4*d.* a pound in consequence of an export duty, the duty would not be paid by the purchaser in London?—I say the prices in London are regulated by supply and demand, without any direct relation to the cost of production. Eventually the cost of production tells, when it affects the supplies. Take a concrete case, at the present moment tea is costing in Ceylon to produce very much more than it did before the closing of the mints, but the price of tea has not gone up in London; it has fallen, simply because the production has increased, and it follows the ordinary laws of supply and demand.

11,249. How do you apply that to the price of tea before the rate fell?—The production was not so great.

11,250. Then it is purely a question of production?—I say it is a question of supply and demand. The prices are regulated by the supplies, not by the cost of production.

11,251. Therefore, if the Chancellor of the Exchequer were to propose to put an additional 6*d.* in the lb. on tea, the price, in your opinion, would not be raised in every grocer's shop the next morning?—Certainly, it would.

11,252. Why—because it would have nothing to do with the cost of production?—Because an import duty would apply not only to the production from Ceylon, but to the production from all other parts of the world wherever tea is produced.

11,253. But the consumer would pay that increased cost of production?—He would pay an import duty. I admit that the cost of production eventually tells.

11,254. However, you think an export duty would be preferable to the present state of things?—I do.

11,255. (*Sir J. Muir.*) I should like you, in your own way, to give us your views, expressing as clearly and concisely as you can the effect of the 1*s.* 4*d.* rate upon the trade of Ceylon?—The effect of the 1*s.* 4*d.* rate upon the trade of Ceylon has been to considerably raise the cost of production. By itself that perhaps would not have been a very serious item, but, as the rise in exchange has been concurrent with the gradual fall in prices, it does form a very important factor. Speaking generally, I would say that a rise of 1*d.* in the rupee is about equivalent to a fall in the price of from $\frac{1}{3}d.$ to $\frac{1}{2}d.$, and amounts, on the average, to about 1 to 1½ per cent. tax on the ordinary share capital of the companies engaged in the enterprise. It has fallen most heavily upon the estates producing a low quality of tea, the margin of profit on which was not so great as on tea fetching higher prices. In the case of the tea selling at 10*d.* a pound and costing 5*d.* to produce, and taking exchange at 1*s.* 4*d.* as compared with 1*s.* 1*d.*, the exchange makes a difference of $1\frac{7}{8}d.$ per pound, all of which comes out of the profit of 5*d.*, and is equivalent to a difference of 38 per cent. of the profit. On the other hand, taking a tea selling at 6*d.* and costing 4*d.* to produce, the difference of 3*d.* in the rupee is equal to $1\frac{1}{8}d.$ per pound, equivalent to a difference of 56 per cent. of the profit.

11,256. The tea companies in Ceylon have recently been issuing their last season's reports, and in most of them I see special reference to that exchange—the difference between the rate that might have been expected under ordinary circumstances, apart from the 1*s.* 4*d.* fixed by the Government—as the main cause of the decrease in their dividends; is that so?—That is so in some cases; and in all cases it has made a difference; amounting, as I have stated, as a rule from 1 to 1½ per cent. in the dividend.

11,257. One of your main factors in the cost of producing tea is the wage that you have to pay to the coolies?—Yes.

11,258. As a rule, in Ceylon, how many coolies do you require, say, for an estate of 100 acres of tea?—It varies; but, in round figures, I would say one man to an acre

11,259. What would the wage be? What proportion of your expenditure is affected by the exchange? Of the cost of laying down in London, how much is affected by the exchange?—In the case of companies established on a rupee basis in Ceylon, or of estate proprietors resident in Ceylon, or of shareholders in sterling companies resident in Ceylon, the difference in exchange applies to the whole net sterling selling price of the tea. In the case of companies established on a sterling basis in London, or of proprietors resident in London, or of shareholders in rupee companies resident in London, the difference of exchange attaches to the cost of production of the tea. In some cases it applies to the whole sterling selling price; in others only to the cost of production.

11,260. You say that the loss in exchange made by the Indian Government was not an actual loss to the country at large?—No, as I have stated in my memorandum, "It was a matter of account, and arose in "the process of setting off the sterling debt due by the "Government against the sterling trade debt due to "the Indian people. This being so, the true policy of "the Government would appear to have been to meet "the Government loss by such additional taxation as "would in its incidence have fallen upon those who "made the corresponding profit; that is to say, the "growers and producers of all Indian exports sent "for sale in gold countries." Inasmuch as the loss in exchange made by the Indian Government was made upon the Council bills which were purchased as remittances for the balance of trade, I say that, taking the country altogether, there was neither loss nor profit; but the exporter of produce made the gain in exchange which the Government lost; and therefore, I think a tax which in its incidence would fall upon him would be a fair one. "If it be true that the limits of direct "taxation in India had been reached, the statement "does not appear to hold good as regards indirect "taxation. Customs duties form a very small pro-"portion of the revenue raised in India, and export "duties would have been a tax, correct in its incidence, "easy to collect, and one that could have been varied "according to circumstances, any further fall in the "exchange value of the rupee, and consequent "increased gain to the producer, being met *pari* "*passu* by an increased export duty, to compensate "for the increased loss sustained by the Government." It appears to me that, if the exports pay eventually, the simplest course is to put a direct duty on exports, to make up the amount required by the Government. The effect of putting up the rupee was this: the Indian producer, taking the rates at 1*s.* 4*d.* and 1*s.* 1*d.*, lost 3*d.* in the rupee on 66 millions. On the other hand, the Government gained 3*d.* in the rupee on 16

Mr. H. Bois.
Dec. 1898.

millions; there were 10 millions of bullion, and there were 40 millions of imports. Now, if all the imports had been consumed by the producer of exports, no doubt it would have been a very important set-off to the loss he made; but the 3*d.* gain upon the imports, I think, is divided in this way: part of it goes to the producer of the imports (to Lancashire we will say, in respect of cotton goods), and the rest to the consumer of the imports. The producer of the exports, however, is not altogether the consumer of the imports; therefore, what forms a set-off to his loss is only, perhaps, one-third of the imports, which may be 15 millions, against the 66 millions on which he loses.

11,261. You have been how many years connected with Ceylon?—This is my fortieth year.

11,262. Then you were there during the great period of prosperity in coffee?—I was.

11,263. You saw the ruin that came on the island when the leaf disease spoilt the trade?—Yes.

11,264. Tea came in, and has enabled the island to regain the prosperity that it lost by the leaf disease in coffee?—Yes.

11,265. Am I correct in assuming that the cost of the Government of Ceylon is supplied mainly by the tea industry?—To a very large extent. The best proof of it is that, when the coffee industry failed, the revenues of Ceylon went down to 12 million rupees. The last budget estimate, which came to hand a few days ago, shows a revenue of 25 million rupees. That is to a very large extent due to the tea enterprise.

11,266. If the action of the Government of India in fixing this 1*s.* 4*d.* rate should make the trade of Ceylon unremunerative, that is to say, if the tenancies of tea estates were to follow, to some extent, the coffee, what effect would that have on the revenue of Ceylon?—It would at once fall off. Of course, there are a great many items of revenue in Ceylon, but the chief are import duty on grain, excise, and railways, all of which would depend to a very large extent on the tea enterprise.

11,267. What proportion, would you say, of the revenue of Ceylon is derived from the tea industry?—That is a very difficult question to answer. I am not prepared, without going into statistics, to name a figure.

11,268. But it is a large proportion?—Oh, a large proportion.

11,269. Are there any points to which you would specially desire to direct our attention in your memorandum which is before us?—In paragraph 2, I say: "Apparently it was assumed that the fall in "the exchange value of the rupee was an evil "calling for remedy, whereas, taking India as a "whole, and not separating the Government from "the people, that fall was probably a substantial "benefit." I should like to call the attention of the Committee to the action that is proposed to be taken by the Argentine Government at the present moment; not that I for one moment defend their proposed action, any more than I do that of the Indian Government. But, whereas the Indian Government have artificially raised the value of the currency relatively to gold, assuming, I suppose, that the depreciation, relatively to gold, was a disadvantage, the Argentine Government at the present moment are seeking to artificially depreciate the value of the currency, relatively to gold, believing that the depreciation was an advantage to the country. The gold premium in Argentina, I think, was at one time as much as 250; it has now sunk to 127, and the Government propose to fix the gold premium at 150.

11,270. (*Sir C. Crosthwaite.*) You do not think that is a good thing?—No; I think it is just as wrong as the action of the Indian Government. I think any interference with the currency is a mistake.

11,271. A depreciating currency is a good thing?—No, I do not say that, necessarily. I do not admit that the Indian currency has depreciated. It has depreciated relatively to gold.

11,272. (*Sir J. Muir.*) What other points in your memorandum do you desire to call our attention to?—"Great importance appears to be attached by the "Indian Government to stability of exchange as an "inducement to the English capitalist to invest "money in India, but fixity of exchange *per se* is not "an essential factor in the question. The determining "consideration in every case is, whether the money "sent out can be returned without loss. If the "exchange value of the rupee is low, approximating "to its bullion value, the risk of loss from a still "lower rate is small, and is counterbalanced by the "possibility of a rise and corresponding profit. On "the other hand, a high rate of exchange, if unfixed, "no doubt acts as a deterrent; because the English "investor runs the risk of serious loss in returning "his money to England. Probably, the inducement "offered to the English investor by an unfixed low "exchange, and a fixed high exchange, are about "equal." In connexion with that, I really am arguing from personal experience, and I take it that my own experience is a fairly typical case. As I have already stated, I have been engaged in business in Ceylon for a very long period. I have also been largely interested in agriculture, and, in a very moderate way, I am also an English capitalist. As a merchant and trader, I do not consider that the rise in exchange, or the fluctuations in exchange, affect me materially. Merchants' combinations generally extend over a very short period, and allowance can be made for the rate of exchange as it exists at the time. As one interested in agricultural enterprises, the rise in the exchange has been, undoubtedly, a loss. It seems to me to be a mere question of arithmetic. I will put it in this way: If you pay for the cost of production in silver, and sell your produce for gold, and if the cost of production in silver and the selling price in gold both remain constant, any appreciation of gold, the metal in which you sell, relatively to silver, the metal in which you produce, must *pro tanto* be a gain, and the contrary must be a loss.

11,273. Assuming the rupee prices and sterling prices to remain the same?—Yes. As a small capitalist, the effect of the rise in exchange has been to make me, personally, withdraw all the money I could from Ceylon, and I expect that that has been the experience of other and larger capitalists. Those are the three points on which I wished particularly to speak.

11,274. Now, the rate that the Government have fixed is 1*s.* 4*d.* Supposing the mints had not been closed, but that exchange had been allowed to fix itself automatically, what do you fancy might have been the rate of exchange to-day?—I think the rate of exchange to-day might have been about 1*s.* 1*d.*—for this reason. The lowest rate of exchange in any one year during the last 15 years was in 1895-6, when it fell to 1*s.* $1\frac{1}{10}$*d.*, the lowest point during the year being 1*s.* 0$\frac{1}{2}$*d.* At that time the price of silver was 27*d.*; the price to-day is, I think, nearly 28*d.* I think further that with open mints the demand for silver would be greater, and that the price would, to some extent, rule high. I therefore see no reason why with open mints the rate of exchange should fall lower than the lowest point that it has hitherto touched. There is a further point I should like to make in connexion with that, which I may put forward as a reason why I think the price of silver would increase if the mints were opened; and that is, that the production of gold relatively to silver is increasing. Last year the total world's output was 47$\frac{1}{2}$ millions of gold, against 40 millions in the year before, and 23 millions eight years ago. That shows an increase on the one year of 17$\frac{1}{2}$ per cent. The production of silver last year was 183,000,000 ounces as against 167,000,000 ounces the year before, showing an increase on the year of only 10 per cent.

11,275. (*Sir A. Dent.*) Where do you get your figures?—I think I took them from the "Statist," which paper printed them from the "American Bureau."

11,276. (*Sir J. Muir.*) Now, I would like the Committee to have a grasp of the grievances of the tea planters of India and Ceylon arising out of this difference of 3*d.* per rupee between 1*s.* 1*d.* and 1*s.* 4*d.* I have got before me the figures of an agency house in Calcutta and in Colombo. They represent large estates both in India and in Ceylon, much larger in India than in Ceylon. They employed last year 92,700 coolies between India and Ceylon, the larger proportion being in India. They paid in wages Rs. 55,62,000. Now I would like you to tell the Committee what difference will arise to the companies managed by that firm between 1*s.* 1*d.* and 1*s.* 4*d.*?—Twenty per cent.

11,277. That would represent in sterling, how much money? This is a case which I know absolutely about, and it is a big case, but it shows what the effect will be on the other concerns which perhaps have smaller interests?—It would be 70,000*l.*

11,278. Then, if other companies, who perhaps have smaller concerns to manage, suffer an equivalent difference, we can understand of course why a good deal has been said by the tea planters of Ceylon and India. Now, I think that the Government of India at one time said that a sound system of currency must be automatic or self-regulating?—Yes and that expresses exactly my own opinion. I will read an extract from a letter from the Government of India to the Bengal Chamber of Commerce, dated February 1877:—"A sound system of currency must be automatic "or self-regulating. No civilised government can "undertake to determine from time to time by how "much the legal tender currency should be increased "or decreased; nor would it be justified in leaving "the community without a fixed metallic standard of "value, even for a short time." In connection with that, I may point out that the currency of India at the present moment is not automatic or self-regulating. The Government does seek to determine by how much the legal tender currency shall be increased or decreased, and it has left the community without a fixed metallic standard of value, not only for a short time, but ever since the closing of the mints in 1893.

11,279. Then you disapproved, I understand, of the closing of the mints?—I did.

11,280. What is your view now; would you propose to reopen the mints?—I would reopen the mints. It appears to me that there are only two sound courses open to the Government. One is to have silver as the standard and reopen the mints to the coinage of silver, the other is to establish gold as the standard and make the rupee a token coin.

11,281. If the Government find difficulty in reopening the mints at once, which I understand you view as a desirable thing if it could be accomplished, is there any intermediate course that you could suggest?—Although I am strongly of opinion that the soundest policy is to reopen the mints and revert to the *status quo*, I think it is quite possible for the Indian Government to establish a gold standard in India; and, provided that the rupee were fixed as a token coin at about 1*s.* 2*d.*, I think that such a scheme would be a fairly reasonable and satisfactory alternative.

11,282. That is to say, 1*d.* higher than you think would be the rate if the mints had never been closed?—Yes.

11,283. You think 1*s.* 1*d.* should be the rate?—Yes.

11,284. But you think that a solution that might be accepted would be 1*s.* 2*d.*?—Yes.

11,285. Would that be acceptable to the Ceylon planters, do you think?—I am only expressing my own opinion, but I think, so far as Ceylon is concerned, the crux of the question is the high value given to the rupee, and, if the value were fixed at about 1*s.* 2*d.*, I think that would be accepted in Ceylon as a fairly satisfactory solution to the question at issue.

11,286. Are there any further points you would like to put before the Committee?—The only point I should like to be examined upon is in connection with a gold standard for India.

11,287. We should like to hear your views fully on that point?—This is a short memorandum which I have prepared, and which fully explains my views. I hope you will understand that, in putting forward this scheme, I do so with extreme diffidence; in fact, I did not propose to put it in unless I had been asked about it:—

"1. A gold currency is not suited to the circumstances of the people of India and Ceylon, and it appears neither necessary nor advisable that, even with a gold standard, gold should go largely into circulation.

"2. To *encourage* in any measure the conversion of 150 crores of rupee and note currency would, in all probability, involve the absorption of so large an amount of gold as to make the scheme practically prohibitory.

"3. The object should apparently be to *discourage* the actual conversion, and under a gold standard to maintain the rupee as a token coin as the chief currency of the country.

"4. But, whatever scheme be adopted, I am strongly of opinion that the value of the rupee should be fixed at not higher than about 1*s.* 2*d.*, instead of at 1*s.* 4*d.* *Theoretically*, of course, there is no reason why a coin intrinsically worth only 10*d.* should not be made to pass as a token coin at 1*s.* 4*d.*, as well as at 1*s.* 2*d.*; but there is a very general opinion amongst producers and traders that *practically* 1*s.* 4*d.* has proved too high, and that the failure of the Government policy inaugurated in 1893 is to some extent due to this over-valuation. It is believed that the various interests involved would accommodate themselves to a rupee at 1*s.* 2*d.*, when they will not to a rupee at 1*s.* 4*d.*, and, unquestionably, the lower valuation would tend to the much smoother working of any scheme that may be adopted. The nearer the token value of the rupee approaches to its bullion value, the less temptation there is to convert it, or to illicit coinage, and the less it handicaps the producer in competing with other countries.

"5. Such a scheme would establish a sound standard on a minimum of gold. It would result in a stable rate of exchange, encouraging, to some extent, the introduction of English capital, and, consequently, cheaper money, while arresting the efflux of capital from India; but would only partially redress the injustice felt by those natives who have converted rupees into bullion and may wish to reconvert it, and only lessen, not entirely remove, the temptation to illicit coinage.

"6. That which I would propose is as follows:—

- "1st. A gold standard to be declared in India and Ceylon, the sovereign to be the unit.
- "2nd. The rupee to be a token coin minted on Government account, and issued according to requirements at the ratio of 17 to the £ sterling, or 1*s.* $2\frac{2}{17}$*d.* per rupee; rupees to be a legal tender to the extent of 80 rupees.
- "3rd. Concurrently therewith, Government sterling notes on a gold basis to be issued for 5*l.* and upwards, as required, at the equivalent of 17 rupees per £ sterling.
- "4th. The existing rupee currency notes for all amounts over Rs. 50 to be called in and redeemed—
  - "(*a.*) By payment in rupees out of the silver reserve held against them.
  - "(*b.*) By the issue in their place of sterling notes for 5*l.* and upwards, at the rate of 1*l.* to 17 rupees. After a given date the rupee notes from Rs. 50 and under, left in circulation, to be legal tender to the amount of Rs. 80 only.
- "5th. The issue of notes and rupees in Ceylon to be in the hands of the Colonial Government, the coin being supplied by the Indian mints at bullion value plus mintage.

Mr. H. Bois.

1 Dec. 1898.

"7. The effect of this would, I believe, be to establish a gold standard with practically a silver and note currency, the latter on a gold basis for all sums over the amount fixed as a legal tender for silver. The Governments in India and Ceylon would have to hold a gold reserve against the sterling notes in proportion to the issue, but the amount of this reserve would probably not be so large as to be prohibitory, while the cost of obtaining it would be met by:—

"(*a.*) The profit on the sterling note issue.

"(*b.*) The profit on the mintage and issue as required of rupees as token coins on Government account.

"8. Under the foregoing scheme bar silver cannot be exchanged for rupees except at 1*s.* $2\frac{2}{17}d.$, and rupees cannot be exchanged for gold, but, inasmuch as they can be exchanged for notes, and notes for gold, the question arises as to the extent to which gold might be absorbed for hoarding purposes.

"9. If the currency of gold were *encouraged*, and sovereigns were brought prominently under the notice of the natives, they might very possibly be hoarded in detail to some extent; but under the foregoing scheme the native would probably rarely see gold, and the temptation to hoard it would be somewhat less than it is at present. If he really wants sovereigns he can, at the present moment, buy them at the rate of about 1*s.* 4*d.* to the rupee; and, seeing that in existing circumstances the rupee is a coin of unstable value at 1*s.* 4*d.*, there is more reason why he should convert it into gold than there would be if it became a coin of stable value at 1*s.* $2\frac{2}{17}d.$ As regards hoarding on a large scale, the same argument applies. The holder of a large quantity of silver can purchase sterling drafts on England at about 1*s.* 4*d.*, and import the equivalent gold coin for hoarding purposes. He can do it with a rupee that may at any time fall in value, and the temptation to so convert it is certainly greater than it would be if he knew that he could at any time get notes for his rupees and gold for his notes at the rate of 1*s.* $2\frac{2}{17}d.$

"10. On the whole, therefore, I think that absorption of gold for hoarding purposes would not take place to any great extent, but it is, of course, a factor of uncertain value, and only experience can determine its importance."

The previous witness, Sir John Lubbock, was asked to state the amount of gold that he thought would be required to establish a gold standard in India. He admitted that the currency of the country must remain the rupee to a very great extent, but he seemed to apprehend that the rupees would be exchanged for gold, to a very large extent; he mentioned 100,000,000*l.*, I think. I cannot, myself, see what inducement anyone would have to convert rupees into gold greater than the inducement there is at present, and my own belief is that the amount required to establish a gold standard in India would be very small. I look at it in this way: the amount of silver currency at present is estimated at 120 crores; the note currency at 24 crores. The only displacement of rupees or rupee notes would be, I think, to form a legal tender for all amounts over 80 rupees. I would maintain the rupee as a legal tender to the extent of 80 rupees, but for amounts over that the legal tender would be gold. Then the question arises: out of this 140 crores of rupees and currency notes, what proportion would be displaced in order to form that legal tender? I think, at a liberal estimate, it would not exceed 45 crores, if so much. Then, say you have to issue Government notes for 45 crores to form the legal tender, for which silver would not be a legal tender, what reserve would you have to hold against the sterling notes? I do not see why it should be any larger than it is in England. Under the Bank Act of 1844 it was found that out of £20,000,000 of notes in circulation, there never, at any time, had been less than £16,000,000, and it was assumed that in no possible circumstances could the amount fall below £14,000,000. It was, therefore, decided that the reserve to be held against them, in gold, should be the difference between the £14,000,000 and the £20,000,000, about one-third. If that holds good for India, the amount of gold reserve to be held against Rx. 45,000,000 of notes would be about Rx. 15,000,000, which corresponds with the estimate that has been put in, I think, by previous witnesses.

11,288. Is there anything else you would like to say to us?—No, I think that is all.

11,289. (*Sir A. Dent.*) In your statement about the proposals for a new currency system in India, are you leaving the existing rupee in circulation, or do you propose to coin a new rupee?—I should simply make the existing rupee a token coin.

11,290. The proposal of the Government is very much the same, but at a different rate of exchange?—The Government have practically converted a standard coin into a token coin. I do not think that the position can be regularised without declaring a gold standard and making the rupee a token coin.

11,291. Is not that rather the ultimate intention of the Government, if they carry through their proposals?—Of course, as I have said, I think the crux of that question is the rate at which the rupee is fixed; I think that a gold standard would work satisfactorily, if the rupee were not fixed at a price which practically handicaps all the exports of India. Why I think there is no difficulty in having a gold standard and a silver currency, is that it existed for a very long time in Ceylon. Up to the year 1871 the denomination of account was pounds, shillings, and pence, and all transactions took place in pounds, shillings, and pence, but the only coin that was ever seen in Ceylon, and was actually current, was the Indian rupee.

11,292. There has been occasionally some discussion as to the real permanent injury that has been done to the Indian and Ceylon tea estates by the closing of the mints, and the fixing of 1*s.* 4*d.* exchange. You have heard remarks also made, I suppose, that in some ways the 1*s.* 4*d.* has been rather a blessing than otherwise in checking production. Will you give us your views on that?—I think that the rise in exchange has tended to restrict the opening of land, and, in so far as there was a danger of over-production, I think that rise may have been a small benefit.

11,293. If it had not been for a check of that sort, it is suggested that some years hence there would have been a very serious calamity, owing to the excessive production?—I think that too much importance can be attached to the rise in exchange. It is only a factor in the question. There has also been a fall in prices, which has been much more important than the rise in exchange. It is the combination of the two that has proved so disastrous, and any fall in exchange would, of course, be *pro tanto* a relief, in the same way that a rise in prices would be.

11,294. The fall in prices has been brought about, has it not, entirely by the increased production?—Yes, I should say so.

11,295. And, if that production is checked, the price will go up again, will it not? The consumption is going on pretty regularly?—Yes; as I said in my answer to the Chairman, I consider that prices depend altogether on supply and demand in the place where the produce is sold, until a fall in prices checks production.

11,296. You suggest that the mints might be reopened under certain conditions, and a duty imposed, which you put at 5 per cent. Do you think 5 per cent. additional duty would meet the requirements of the Indian Government?—I do. To begin with, out of the 16,000,000*l.* of remittances made by the Indian Government, or I think now it is 17,500,000*l.*, fully one-half is in connexion with the commercial undertakings of the Indian Government—railways—and I consider that the loss of exchange on that amount is simply an item of expenditure attaching to the railways.

11,297. Have you considered how that 17,000,000*l.* is made up?—About 8,000,000*l.* of it is in connexion with railways and remunerative works.

11,298. You must study that rather closely, I think, before you can give any opinion upon it?—I was

basing it, I think, on a speech of Sir Henry Fowler's in the House of Commons, in which he said that about half of that 16,000,000*l.* was in connexion with Indian railways.

11,299. I have had an opportunity of studying it, and I know that it is an amount that cannot be reduced in any way except by buying things in India instead of England. You would pay less sterling, but then you would have to pay more rupees in India, so that it would come to the same thing?—I think, as regards that portion of the sterling debt, the obvious way of raising the revenue is to raise the railway rates in respect of which that charge is incurred. However, I admit that ultimately the Indian Government must get it one way or other.

11,300. These things have to be got, and, whether they are bought in England or in India, the cost must come into the budget?—That is so, no doubt.

11,301. The revenue of Ceylon has not suffered yet, has it?—The Ceylon Government revenue has not suffered yet, nor will it suffer until estates are worked at a loss; so long as they go on at all, the revenues will remain the same.

11,302. There is some fear, is there not, in Ceylon that, unless something is done, some estates will have to be closed?—It is estimated that, if exchange were to go up 1*d.* or 1½*d.* in the rupee, or the price of tea to go down ¾*d.* or 1*d.* per pound, estates now producing 30,000,000 lbs. of tea would go out of cultivation. In that case, of course, the Government revenue would be affected.

11,303. (*Mr. Campbell.*) What proportion would that be; that would be a third of the total?—About a fourth.

11,304. I think you admit that there might be certain advantages in a gold standard as compared with a silver standard?—I do.

11,305. That it would give stability to exchange, which a silver standard with open mints does not give?—I think the question of exchange must always come in. If you establish a gold standard, it would give stability to exchange.

11,306. Of course, from merely having heard you read your scheme, I do not feel in a position to go fully into its details, but among other things you say you think 80 rupees ought to be the limit of legal tender for the rupee?—I fixed that because it is the highest amount of rupees under a 5*l.* note which I propose the Government of India shall issue.

11,307. But I suppose you will admit that, for many years to come, rupees will have to be the real circulating medium thoughout the country?—I would only make it the legal tender for that, but I believe it would be used for the payment of larger amounts as it is at present.

11,308. If that is so, is it wise to restrict it to 80 rupees?—I do not see how you can have a gold standard and a silver rupee legal tender for all amounts. I think it must be a token coin.

11,309. Take the case of France. There the standard is gold; the mints are shut to silver, but both gold and silver, or either of them, are legal tender to any extent?—That is so; but in that case it ceases to be an automatic currency; it is in the hands of Government. They can only then issue silver as they think the circumstances require it.

11,310. But it does not seem to have led to any inconvenience in France all these years. They are getting on very well under that system, are they not?—I cannot say that I know very much about the economy of France; but, as far as India is concerned, I think it must either be a gold standard or a silver standard. I do not see how you can have the two standards.

11,311. Would it not be apt to lead to very serious complications, if, while rupees were the real circulating medium, the law made them legal tender only to the extent of 80 rupees; might not that lead to serious difficulties between debtor and creditor?—I do not think so, because I should make the rupees convertible.

11,312. Then you talk about the issue of about Rx. 45,000,000 in currency notes?—That is my estimate.

11,313. How would you get these notes into circulation?—By exchanging them for existing notes and also for rupees.

11,314. But existing notes only circulate practically in the neighbourhood of the large Presidency towns. The natives do not take notes in the interior at all. You would not force these notes on the natives?—No. I would simply issue them as required. I would explain that after a certain date rupees would be a legal tender only to the extent of 80 rupees, but that they would be exchanged for sterling notes at the rate of 17 rupees to the £ sterling.

11,315. You would issue the sterling notes in exchange for rupees?—Yes.

11,316. And undertake to repay them in gold?—Yes.

11,317. How would you find the gold?—I do not think it would ever be demanded.

11,318. You would trust to its not being demanded?—Yes; I would simply hold a gold reserve to the extent of one-third; yon would already hold a silver reserve against them, but I would hold a reserve in just the same proportion as they do with Bank of England notes.

11,319. Would you not be afraid of the risk of a breakdown, supposing you did not get your notes into circulation to any larger extent than notes circulated now, and still made 80 rupees the legal tender limit for silver coin?—You would have to fix a certain date up to which you would exchange sterling notes for rupee notes. After that, the demand for notes would be according to the requirements of the internal trade. Anyone could get them at the rate of 17 rupees to the £ sterling.

11,320. (*Mr. Le Marchant.*) How would those notes be exchangeable up-country? Would there be any great facility for obtaining rupees by any holder who wished to make small payments?—Only in the same way that in England now a holder of a 5*l.* note would get change. He would get it in the bazaar. I very much doubt whether they would reach the interior to any extent, because they would be only required as legal tender for amounts over 80 rupees.

11,321. And that would tend to limit their circulation to within the neighbourhood of banking centres?—Exactly. What it would really come to is this: there would be a rupee currency, and a sterling note currency on a gold basis. I do not think gold would ever get into circulation at all. It would be just the same as the case of Canada. With the Government at the back of the note, I do not think any native, unless he wanted to hoard, would exchange it at all; the note is quite as convenient to him as the sovereigns. When the Ceylon Government guaranteed the notes of the Oriental Bank Corporation, the natives did not hasten to convert them.

11,322. Take the instance you have mentioned in Ceylon; the notes were already familiar to the community?—That is so.

11,323. Here it would be the introduction to a certain extent of a newer form of currency?—Yes, but I think they would only replace rupees where they were required in payment of a large debt.

11,324. And where they might be a new convenience?—Yes.

11,325. You were speaking just now of the Argentine Government: have you heard that there is any official proposal to prevent the premium on gold from falling below a certain figure?—My information was derived from, I think, the "Statist." They wrote strongly deprecating it, and gave the text of the proposal, which was to fix the gold premium at 150.

11,326. In speaking of the possible fall of exchange, I think you were speaking of 1*s.* 1*d.* or thereabouts, as having been a rate that had prevailed three years since?—Yes, 1895–6.

Mr. H. Bois.
1 Dec. 1898.

11,327. And connecting that, if I understood you rightly, with a price of silver?—Yes.

11,328. The price of silver that would coincide with a rate of 1*s.* 1*d.* if the mints were open is, I think, nearly 34*d.* That, so far as it might be required as a basis for the value of the rupee, would be a material rise above the present price of siiver?—Yes, but there has always been a difference between the bullion value of the rupee and the exchange value of the rupee.

11,329. You were alluding to a loss of about 3*d.* in the rupee, I think you said, on the whole volume of exports?—Yes.

11,330. If one person pays that, does another receive it? Is it a transfer?—It is, to a very great extent.

11,331. Let me put my question in this way. If the Indian producer sells his sterling bills drawn against produce, under the conditions suggested, he receives fewer rupees in the proportion you were mentioning; the purchaser of that bill buys his sterling exchange for exactly the same proportion less?—Yes, but I explained what the set-off was. I took a profit and loss account. On the one side there is 3*d.* in the rupee on the whole exports, which amount to 66 millions. Then, as you ask, on the other side, who gets the gain? The Government get the gain as to 16 millions. There is gold and silver to an extent of 10 millions; who gets the gain on that, it is rather difficult to see. I should like to say something about that, and to draw the attention of the Committee to the exports of silver during the last few years. At the time of the closing of the mints, the exports of silver to India were about 15 crores. In the three following years it fell to 8 and 7 crores. Last year it went up to 13 crores. Seeing that the mints are closed, the question arises what becomes of that silver. It seems to me to point to one of three things; either hoards of rupees have been released and bar silver substituted, or illicit coinage is going on to a very considerable extent, or—and possibly all of these combined—bar silver is being imported into India on the chance of making a profit, possibly in connexion with this Currency Committee.

11,332. (*Mr. Campbell.*) One point you have omitted, I think, is that a very large proportion of these exports of silver into India are merely meant for coinage of the British trade dollar?—However, that was only by the way. I pointed out, as regards the 16 millions, that the Government got the benefit. There was 10 millions of silver bullion which also forms a set-off, and then there are the imports of 40 millions.

11,333. (*Mr. Le Marchant.*) I do not know that I quite follow about the silver bullion; do you mean that there is an additional import?—No; the exports amount to 66 millions; on the other side, you have imports 40 millions, the bullion 10 millions, and Council bills 16 millions, making up the 66,000,000.

11,334. Then would you say that, owing to the rise in the sterling value of the rupee, India is able to import more silver?—No, but it pays less for its imports; that is the set-off. The loss on one side and the gain on the other side is the lower price paid for the imports. If the exports exactly balanced the imports, and the price of imports fell in exact proportion to the rise in exchange, there would be no loss either way, it would be balanced.

11,335. Is it not the case that, taking it within the boundaries of India itself, there might be a considerable transfer of profit from one set of persons to another, owing to the fact of such a difference in exchange as you are mentioning?—I think the exchange only comes in in transactions with foreign countries. Internally I consider the rupee is what it always has been. It passes at much the same value. I do not think that in any internal transactions any question of exchange comes in.

11,336. Then you would limit it to the effect on imports, whatever they may be?—Yes.

11,337. And, apart from that, interests within India are not affected?—No.

The witness withdrew.

Adjourned.

TWENTY-FIFTH DAY.

Tuesday, 10th January 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR.

Sir JOHN MUIR, Bart.
Sir FRANCIS MOWATT, K.C.B.
Sir DAVID BARBOUR, K.C.S.I.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. EVERARD HAMBRO.
Mr. W. H. HOLLAND.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

[*For the evidence of Sir Robert Giffen, K.C.B. on this day, see page 93 above.*]

MR. HORACE SEYMOUR, C.B., called and examined.

Mr. H. Seymour, C.B.
10 Jan. 1899.

11,338. (*Chairman.*) You are the deputy-master of the Royal Mint?—Yes.

11,339. How long have you occupied that position? About four and a half years.

11,340. Can you tell the Committee what was the law as regards the metallic currency in England up to the year 1774?—Silver was originally the sole standard of value in England, but by degrees gold was gradually introduced, and was accepted, not by law, but by custom, side by side with silver.

11,341. Was gold a legal tender?—It was accepted—it circulated side by side with silver.

11,342. That was up to the year 1774?—Up to the year 1774.

11,343. What were the causes which led to the currency legislation of 1774?—The real reason was that the gold coin which had become in practice the standard measure of value—silver having been driven out—had become very much reduced in weight owing to diminution by clipping and wear, and the exchanges

were in consequence adversely affected. The attention of Parliament was accordingly called to the matter, and the result was a complete reformation of the gold coinage. That was in 1774.

11,344. Did the standard alter?—No, the standard remained the same.

11,345. I suppose they fixed the silver price of the guinea?—That was in 1717. The guinea was issued originally in the time of Charles II. as a twenty shilling piece, but it never circulated as a twenty shilling piece. It began at 21*s.*, and gradually, owing to the faulty condition of the silver coinage went up to 30*s.* In the time of William III., in 1695, it was reduced to 26*s.*, and then to 22*s.*, but that had no practical effect. The gold was still over-rated, and in 1717 the Government of the day took the advice of Sir Isaac Newton, and he recommended that the guinea, which had been circulating at 21*s.* 6*d.*, should be rated at 21*s.*, and that was carried out by Proclamation.

11,346. The guinea had at one time circulated for a great deal more than 21*s.*?—That was in 1695, when it was reduced by Act of Parliament, first to 26*s.*, and then to 22*s.* Even that reduction was not enough, and in 1717, as I have mentioned, the silver in circulation being either worn or base, and gold being still overrated, the Government asked for the opinion of Sir Isaac Newton, and he went into the matter and compared the rates of silver in Europe and in the East, and he recommended that the guinea should be valued at 21*s.*

11,347. The legislation of 1717 was really restoring the currency to its proper value?—Yes. Then in 1774 a very important Act was passed. The gold coin was all called in and re-coined, and was in future to be circulated by weight. Before that, gold had been circulated by tale only, and Parliament now introduced a new principle by which there was a fixed least current weight, below which the coin should not circulate. That was the first important principle which was then established. If the guinea fell more than a grain below its issuing weight, it ceased to become legal tender. That was so far as regards gold. Then, with regard to silver, the coinage was in an extremely bad condition, very much worn, a great part had been imported from abroad, and an Act was passed to prohibit the importation of light silver into the kingdom at all. Further than that, a new principle altogether, which had never been adopted before in the currency of this country was introduced, and that was this. Parliament fixed a limit to the tender of silver. Hitherto, silver coin had always been unlimited in tender, but in 1774 they fixed a limit of 25*l.* to its tender. Debts beyond that amount were to be paid in silver by weight at 5*s.* 2*d.* per ounce.

11,348. Weight of silver?—By weight of silver. It was taken by tale up to 25*l.*, and over that amount any debt was to be paid by weight. Of course, the coinage being in such a very depreciated state, it was not worth a man's while to take advantage of the provision, because, supposing shillings to have been deficient to the extent of 20 per cent. of their original weight, a moderate estimate, it would have cost him something like 125*l.* to pay a 100*l.* debt. So that, although that Act was passed, and a very important principle was introduced, it really had no effect.

11,349. The next great step in the currency history of this country was Lord Liverpool's scheme in 1805?—Lord Liverpool's letter to the King, which is very well known, and has often been quoted, was really a report which he had drawn up in 1798 for the Privy Council Committee, which was appointed to enquire into the state of the coinage. He laid down a great many principles, and for some reason or other, which I am not quite clear about, the Committee did not then adopt his report. Afterwards he worked it up, and addressed it as a letter to the King. The chief principles advanced by him were three. The first was that coins which were to be the principal measure of property and instruments of commerce, should be made of one metal only; hitherto there had been two circulating. Then he drew the conclusion that gold was the best for that purpose. Of course, there was a difference of opinion on the point, but he argued that gold was the best metal to select as the sole standard of value. The third principle he laid down was that silver and copper were to be subordinate and subservient, and merely representative coins, and that where the function of gold ceased that of silver should commence, and that where the function of silver ceased copper should step in. He chose originally the guinea as the limit where silver should step in; he thought that above that sum silver should not be legal tender, and he took the shilling as the point where copper was to play its part. Those three different points were the foundation of the legislation of 1816, which is practically what we are working under now. They were adopted by the Committee on Coinage; they were reported to the House, who drew up resolutions founded on them, upon which the Act of 1816 was brought in. It was very slightly modified. Parliament adopted two guineas instead of one guinea as the limit of tender of silver, and that was subsequently reduced to 2*l.* Those are the principal points of Lord Liverpool's recommendations.

11,350. Since 1816 we have worked in this country on a monometallic system, gold being the standard metal, and the silver coinage and the copper coinage being purely subsidiary?—That is so. I may mention that in the Act of 1816, with regard to silver, there was a change made. Hitherto, out of the pound of silver 62 shillings had been cut. By the legislation of 1816 it was decided to cut 66*s.* shillings out of the pound, and four of those were to be retained as brassage and seignorage to pay the expenses of the Mint.

11,351. That was out of the pound of silver?—Out of the pound of standard silver. That would be 5*s.* 6*d.* per ounce, which is the present rate.

11,352. Out of a pound of silver there were to be how many shillings?—Sixty-six, instead of 62 as the number had been hitherto. It was proposed to retain four out of the 66, and only to return the same number as before, 62, to the person who brought the silver to the Mint; but that proposal has never been acted upon. It was to be carried out by proclamation. No proclamation was ever issued, and the result is that now we cut 66 shillings to the pound, and people cannot bring silver to the Mint at all. The proposal to retain 4*s.* out of every 66 was made under the idea that the Mint was to be open to silver.

11,353. How is the value of the shilling fixed now?—It was fixed by the Proclamation of the 1st of March 1817.

11,354. That is what you are working under now?—We are working under the Act of 1816, as re-enacted by the Coinage Act of 1870; but the particular provision to retain 4*s.* never became operative. Under the Act of 1816 silver could be brought to the Mint, subject to the proclamation of the terms under which it could be so brought. Anybody could bring it; but, as the proclamation was never issued, the provision remained inoperative, and silver is now issued at sixty-six shillings to the pound of standard silver; but it is not issued except on payment of gold.

11,355. I want you to tell us when that was done, because, up to that time, anybody bringing silver to the Mint could get it coined?—Not quite; not up to 1816, because in 1798 they stopped the free coinage of silver altogether.

11,356. The English Mint was "closed to silver" in 1798?—Yes.

11,357. That would be under an Act of Parliament?—Yes.

11,358. What was the Act?—38 Geo. III. c. 59.

11,359. And since 1798 the English Mint has never been opened to silver?—It has never been opened since to free coinage.

11,360. The only free coinage now at the Mint is gold?—Yes.

Mr. H. Seymour, C.B.

10 Jan. 1899.

11,361. You are obliged to coin gold?—Under certain conditions, yes.

11,362. And you are not obliged to coin silver?—No.

11,363. Who regulates your coinage of silver; is it the Bank of England?—As far as England and Wales are concerned, the Bank of England apply to us when silver is wanted; they tell us what denominations they want, and how much of each denomination, and then they pay us, or make a transfer to our credit for it, in gold.

11,364. You buy the silver; they do not bring silver to you?—No, we buy our silver.

11,365. The Bank of England says, in other words, "We are prepared to buy from you a million's worth of silver," for which they pay you in gold?—Or credit, yes.

11,366. Do you supply anybody else but the Bank of England?—There are certain banks in Scotland who agree among themselves what they want, and come to us through the Bank of Scotland; and we supply them in a similar way, and the Bank of Ireland also.

11,367. But no bank in England can come to you except the Bank of England?—As a matter of practice, that is the arrangement that has been made as far as silver generally is concerned. Threepenny pieces rest on a different footing, anybody can come for threepenny pieces, that is only a minor detail.

11,368. (*Sir F. Mowatt.*) Even there you exercise your own discretion?—The Chancellor of the Exchequer, who is *ex officio* Master of the Mint, is responsible that there should not be an over-issue, and, if necessary, he could always refuse to supply silver even if it was asked for. There is no right of demanding silver.

11,369. (*Chairman.*) What I want to get at is this: the Chancellor of the Exchequer, who represents the Government, ultimately regulates the amount of silver which is in circulation; he could stop it?—He could, if the occasion arose; but it has not arisen.

11,370. But he has the power to stop it. Suppose the Bank of England were to ask for an amount of silver coinage which the Chancellor of the Exchequer was of opinion was not wanted, has the Chancellor of the Exchequer power to refuse the Bank of England?—Oh yes, there is no obligation on the Mint to issue.

11,371. To issue to anybody?—To anybody, as far as silver is concerned. I am talking of silver.

11,372. Your arrangement with the Bank of England is a purely conventional one?—Yes it is.

11,373. There is no statutory authority at all?—No, not with regard to that arrangement.

11,374. There is no obligation on the Bank of England to come to you, and there is no obligation on you to entertain the Bank of England's application?—No, it is a matter of convenience.

11,375. (*Sir D. Barbour.*) The Bank of England makes no profit out of the silver that it gets from the Mint; the profit goes to the Government?—The profit goes to the Government.

11,376. The Bank makes no profit out of it in that way?—Not that I am aware of. We make them a payment to cover the cost of carriage; whether they get any profit out of that I cannot tell.

11,377. (*Chairman.*) The Bank brings you a gold sovereign, and you give them twenty shillings, although those twenty shillings may have cost you under 9*s.*?—That is so.

11,378. (*Sir D. Barbour.*) Then, if the Bank took from you more silver than is required by the country, that would remain on the hands of the Bank, and would be so much of their capital lying idle?—It would remain on the hands of the Bank, yes.

11,379. Therefore, those two things are a guarantee that the Bank will not ask for more silver than the country really requires?—I think you may take that view.

11,380. (*Chairman.*) Is British silver coined anywhere else than at the Royal Mint?—No.

11,381. Gold is coined at other mints?—Gold is coined at the branches of the Mint at Sydney and Melbourne.

11,382. Anywhere else?—Well, Perth in Western Australia is going to open a mint presently, it has not begun to coin yet.

11,383. Now, will you tell us what is your estimate of the active circulation of gold and silver and copper coins in the United Kingdom at the present time?—We estimate that the total active circulation is now 68,000,000*l.*

11,384. That is gold?—Gold. That is at the rate of 1*l.* 15*s.* 10*d.* per head of the population. Silver is estimated at 23,000,000*l.*, which gives 11*s.* 5*d.* per head of population. Bronze is estimated at 2,000,000*l.*, which gives 1*s.* per head of population. As to gold, the estimate is fairly accurate; we have had opportunities which have enabled us to arrive at a fairly accurate estimate. The silver and bronze are rather wider estimates; you cannot trust them quite so implicitly.

11,385. On what principle have you calculated the silver that is in circulation?—The calculation is based upon an inquiry conducted in 1891 by Mr. J. B. Martin, who went into the matter at the suggestion of the Institute of Bankers, and he made a calculation from various investigations which he made through the banking community, and from the Customs returns, and arrived at an estimate, which was generally accepted. We have merely built on to that by the withdrawals and issues since then.

11,386. What do you call withdrawals?—Withdrawals of worn silver out of circulation. Every year a certain amount of worn silver is withdrawn and sent in by the Bank of England for re-coinage.

11,387. Light silver?—Worn silver; it is not technically light silver, there being no least current weights prescribed.

11,388. You can tell, I suppose, how much silver you have coined, say, in the last 30 years?—Yes.

11,389. The calculation is per head of the population of the United Kingdom?—On the estimated population of the United Kingdom at the present time.

11,390. You include in your 68 millions all the gold coins which have been coined in Australia?—No, we include the number of coins from Australia which are circulated in this country. We arrived at the conclusion after the investigation we made in 1895, that 40 per cent. of the sovereign circulation was in Australian coins.

11,391. (*Mr. Campbell.*) As much as 40 per cent.?—Yes, that was the result of the examination we made in that year.

11,392. That is four out of every 10 in circulation?—Yes.

11,393. (*Chairman.*) How many have you assumed to be in circulation in Australia? Of course you have allowed for a certain quantity being in circulation in Australia?—This estimate is entirely irrespective of Australia. It refers only to the circulation in the United Kingdom. I really cannot tell you what the circulation in Australia is; that is a separate matter altogether. All I say is that now the active circulation, in this country, including coins of Australian production, is estimated at 68,000,000*l.*

11,394. But I want to test that, or to get at some valid reason for taking it as accurate. First of all, there is the import of gold in bullion into this country; then there is the gold that is coined at the Mints; then there is the export of gold from this country for many purposes throughout the world. Now, have you any record to show how much of the gold exported is sent out in coin and how much in bullion; is there any record?—The Customs keep a record, and could furnish you, probably, with a return of the amount of bullion and the amount of coin exported and imported, but I cannot say what it is.

11,395. Perhaps it would not be a very reliable guide if we had it, would it?—I would rather not say anything about its being reliable or not.

11,396. It would be, of course, reliable as to the facts of the case, but I mean it would not be a reliable guide on which to base a theory?—No.

11,397. It would not give you any reliable evidence as to the amount of coin in circulation?—No.

11,398. Then we take it as your opinion, arrived at from other sources, that there are from 60 to 70 millions of gold coin in circulation in the United Kingdom only?—In the United Kingdom only.

11,399. Now let us have the exact proportion of the gold coinage to the silver coinage. The silver coinage is a third of what the gold coinage is, is it not?—About that.

11,400. What is the bronze?—The bronze is two millions.

11,401. Then the whole of the coinage of this country would be 93 millions?—Yes; that is in nominal value.

11,402. I mean its value as coin?—Yes.

11,403. And silver is over 23 per cent. of that?—About 25.

11,404. Is the amount of silver that is coined annually pretty uniform, or does it fluctuate very much?—The last 10 years it has averaged from 756,578*l.* at the lowest to 2,224,926*l.* at the highest.

11,405. (*Sir D. Barbour.*) Is that the new coinage?—The new coinage.

11,406. Not allowing for withdrawals?—It is the nominal value of the issue of new coin manufactured from silver bullion and worn coin taken together.

11,407. (*Chairman.*) Does that include the Colonies?—Yes, it would include the Colonies—you mean, of course, the sterling-using Colonies—but the coinage does not represent the amount actually issued in a given year, it may be more or less.

11,408. That, of course, would vary, but what I want to get at is this. Is all the silver coinage which our Colonies have, in Africa and the West Indies and elsewhere—is all that included in that total?—Yes.

11,409. (*Mr. Holland.*) Which was the lowest year and which was the highest?—I took 10 years. I gave you the highest and the lowest figures during those 10 years.

11,410. (*Chairman.*) Which was the highest?—I have taken the figures between 1888 and 1897. The lowest was in 1888 and the highest in 1889.

11,411. Is there any other mode of regulating a token coinage adopted in other countries?—In some countries they have adopted the plan of limiting the token coinage to so much per head of the population. In the Latin Union, which embraces, as you know, France, Italy, Greece, Switzerland and Belgium, they originally limited it to six francs per head, and it was increased in 1897; but their rule is that they can only issue so much per head. In Russia they adopt the same system. They have a limit of coinage of three roubles per head, which they cannot exceed, but in both cases they combine also with that the plan which is adopted in other countries, of having a limit of tender as well as a limit of supply.

11,412. (*Mr. Hambro.*) Does that apply to the five-franc piece in France?—The five-franc piece is unlimited tender in France.

11,413. (*Mr. Campbell.*) But you cannot send silver into the French Mint to be coined?—No, they have stopped unlimited coinage. I think practically all the countries that were formerly bi-metallic have limited the coinage of silver now.

11,414. (*Chairman.*) But you said that the five-franc piece is unlimited tender in France, did you not?—By law.

11,415. Many regard it as a token coin, but it is an unlimited tender for the payment of any debt?—It is a token coin so far as its coinage is restricted, and its intrinsic value is less than its nominal value.

11,416. (*Sir F. Mowatt.*) You did not give us, I think, the proportion per head of the token coinage in the Latin Union?—In 1865 it was limited to 6 francs per head, the legal tender limit being fixed at 50 francs, but the limit per head was increased to 7 francs in 1897.

11,417. That is not including five-franc pieces; you only mean subsidiary coinage?—I refer entirely to subsidiary coinage, 2 francs and under.

11,418. (*Mr. Hambro.*) But I regard the five-franc piece as a subsidiary coinage?—I understood Sir Francis Mowatt to refer only to the avowedly subsidiary coinage, which was originally limited in the Latin Union to six francs per head. As regards the five-franc piece, it is no longer struck; they do not coin five-franc pieces any more at present—they have such an enormous stock of them—but they are unlimited tender.

11,419. (*Chairman.*) But nobody can take silver and have it turned into five-franc pieces?—No.

11,420. (*Sir J. Muir.*) Have you any idea of the number of these five-franc pieces in circulation in France?—M. de Foville, who is the head of the French Mint, and is a recognised authority on this subject, estimated the value of five-franc pieces in France at 1,935 million francs; that will give you, divided by five, the number of pieces.

11,421. (*Chairman.*) A great portion of that is in the Bank of France, is it not?—I believe it is about forty millions sterling.

11,422. What I want to know is whether the number that you have given there includes the number that are in the vaults of the Bank of France?—It includes that. It is "existing stock in the country."

11,423. (*Mr. Hambro.*) In France alone?—In France alone.

11,424. (*Chairman.*) Do you see any reason why, if the total coinage of tokens be restricted, there need be any limit to the amount to which such tokens can be admitted as legal tender?—I feel some diffidence in answering this question, because it is rather outside the questions of fact, but I think, as far as I can judge, that, provided your restriction is adequate, and that at the same time the Government maintains a sufficient amount in circulation for the purposes of trade, there is no reason why there should be any limit of legal tender.

11,425. (*Sir F. Mowatt.*) Your restriction of issue?—I mean your restriction of issue. As I understand, the value of your token is maintained by a restriction of coinage, and, if your restriction is sufficient to enable you to keep up that value, I do not see any reason why there need be any limit on the amount of tender.

11,426. But do you say that the value of the token depends on the restriction of the issue?—I understand that the value of the rupee depends upon its restriction of issue.

11,427. If a rupee is taken at 15 to the £, how does it affect the value of the rupee whether there are more or less of them?—I understand that the value of the rupee was in great part raised by closing the Mints and thus limiting its issue.

11,428. (*Chairman.*) That is your argument?—That is what I understand.

11,429. (*Mr. Hambro.*) Is not silver in England sometimes sold at a discount, or, at all events, bronze?—I cannot answer that question.

11,430. (*Chairman.*) Now, what have you to tell us about illicit coinage in this country? Let me put my question in this form. The intrinsic value of a shilling is now very different from its nominal value. Has that led to a large amount of illicit coinage?—The fall in the value of silver has had no effect in the sense of increasing illicit coinage in this country. In this country the counterfeit coins have been, and are still, very much of the same nature: they are run in moulds, they are of base metal, and silver does not enter into their composition at all. As far as I am aware, there has been only one case—a recent case—out of all the cases that have been taken up by the police, where the coin had silver in its composition at all, or where it approached to anything like the standard. All the rest of the cases have been the same as they have been for many years past, but there is very much less false coinage now than

Mr. H. Seymour, C.B.

10 Jan. 1899.

there was a few years ago. Cases fluctuate in number from time to time, because false coinage in this country is very much in the hands of the same people. They are sentenced to imprisonment for three or five years, or whatever the period may be, and cases decrease. They come out, and false coinage becomes active again. In 1860 there were 887 persons charged with illicit coinage, of whom there were 438 convicted. In 1870 there were 517 persons charged, of whom 278 were convicted. In 1890 there were 169 persons charged, of whom 95 were convicted. In 1897 there were 148 persons charged, of whom 96 were convicted. So that in nearly 40 years the persons charged have fallen from 887 to 148, and the convictions have fallen from 438 to 96. That is for the whole of the Kingdom.

11,431. (*Sir F. Mowatt.*) That does not include passing bad coinage, does it?—That includes all offences against the Currency Acts.

11,432. Including passing?—Including passing, uttering, and all other offences.

11,433. (*Chairman.*) And that diminished rate has gone on, notwithstanding that there is now, and for the last 10 years has been, a very great profit if they had used standard silver of full weight?—Just so.

11,434. (*Sir J. Muir.*) These are all cases of base metal?—I believe so, except the one case in 1898, when there was an attempt to coin silver.

11,435. (*Chairman.*) That was a case where they put in more silver?—It was not up to standard. In the evidence the counterfeit coins were said to be "about 885 fine."

11,436. (*Sir F. Mowatt.*) You have described to us the process by which additional silver is from time to time issued. I will just go over it again. The Banks of England, Scotland, and Ireland apply to the Mint, and recommend the issue of additional silver; they do that on the ground that the existing stock of silver in circulation is not large enough for the trade of the country; I suppose that is the main ground?—They practically feel the pulse of the three Kingdoms, and come to us when they find that it is getting low—when the supply is insufficient for the wants of the community.

11,437. And it is on that ground that the Mint complies with the application and issues new silver?—Yes.

11,438. That issue is very profitable to the Mint?—Yes.

11,439. But is not profitable at all to the Bank?—No.

11,440. Therefore, the party who makes no profit out of it has to start the application, and the party that makes a profit out of it only complies with that application?—Yes.

11,441. The profit-making process cannot originate with the Mint; it originates with the banks, who have no interest in it?—Just so. Of course, it is in the interest of bankers to meet their customers' wants.

11,442. Now, do you think it undesirable that the authorities who apply to the Mint and move them to issue additional silver, should have any interest in the seignorage or brassage on the issue of that coinage?—I do not see what claim they have to it at all.

11,443. But do you say that it is an essential part of such an arrangement that the authority that moves the Mint to issue additional silver should have no personal interest—no interest of profit in that issue?—Certainly, because very likely it would lead to an over-issue.

11,444. I will take you on to that. Assuming that the banks had any share in the seignorage or brassage on the issue of silver, would it be to their interest to apply for a large addition to the silver coinage?—They would be under an inducement to do so.

11,445. It would operate in that direction?—Yes.

11,446. (*Mr. Hambro.*) It would only be to their advantage to do so if they could get it into circulation?—Certainly.

11,447. (*Sir F. Mowatt.*) The Master of the Mint, in such a case, would have to make a closer examination as to the necessities of trade than he does at present?—Yes. If the profit was to go outside the State, the State would have to look much more closely after the requisitions made to it for more coinage.

11,448. And that, if carried to any extent, might lead to something like friction between the Mint on the one side and the banks applying for additional silver on the other. I do not say it would lead to it, but it would operate in that direction?—It might, yes.

11,449. (*Sir D. Barbour.*) I think you said that the old legal standard of England was silver?—Yes, originally.

11,450. You are aware, no doubt, that gold coins also circulated as well as the silver coins?—By degrees, yes.

11,451. For a very long time?—Yes.

11,452. And the ratio between the gold coins and the silver coins was fixed by the Government?—Yes, it was fixed by a Proclamation, I think.

11,453. (*Sir F. Mowatt.*) From time to time?—From time to time; the rate varied.

11,454. (*Sir D. Barbour.*) Then, in the time of William III., the silver coins had fallen into a very bad state?—They had.

11,455. And then they were recalled, and good coins were issued?—Yes.

11,456. Now, you will recollect that at that time the guinea went up to a very high rate?—Yes, I have referred to that already.

11,457. It went as high as nearly 30*s.*?—It went up to 30*s.*

11,458. And was gradually reduced by the Government by proclamation?—In the first instance by legislation.

11,459. And afterwards by proclamation; but the guinea was still over-valued as compared with the market price of gold?—It was.

11,460. The result of that was that the silver coins were exported and gold circulated in England?—Yes.

11,461. And that is how we came to have a gold currency, although the legal standard was silver?—That is so.

11,462. That is how it came about?—That is how it came about in the main.

11,463. Now, you said that there had been one case of false coining in fairly good silver in this country, and in that case the coins were made by a die?—Yes.

11,464. They were stamped; they were not cast?—They were not cast.

11,465. Have you seen any of those coins?—They were seen by the gentleman who went up to give evidence from the Mint.

11,466. Would it be easy to distinguish them from the genuine legal coins?—I think, to the ordinary person, they would be difficult to detect; an expert in coinage might have looked at one of these coins with suspicion, but the ordinary person would have accepted it, and, as a matter of fact, a certain number of these coins went into circulation.

11,467. (*Sir. J. Muir.*) Have you any idea how many went into circulation?—I cannot tell you that exactly.

11,468. Would it be large?—Probably something over 20*l.* in nominal value.

11,469. (*Sir A. Dent.*) As to your estimate of gold in circulation, 68 millions; is that what is estimated to be in the people's pockets, or does it include also the amount of sovereigns in the Bank of England and other banks?—We take the *active* gold circulation in the country at about 68 millions. Including Bank reserves, the whole amount may be 95 millions. The figures I first gave you were entirely for active circulation. They were calculated for the purpose of ascertaining the amount of repair the coinage required.

11,470. My point is that, for the purposes of this inquiry, and, I think, for ordinary commercial pur-

poses, no distinction can be drawn between a sovereign that is in my pocket and a sovereign that is in the vaults of the Bank of England; both are in circulation?—Oh, yes, in that sense.

11,471. I want the amount of gold coinage which there is outside the Mint in this country?—Our estimate is 95,000,000*l.*

11,472. (*Sir J. Muir.*) You say it would be upwards of 90 millions?—95 millions.

11,473. (*Sir A. Dent.*) If you include the bullion in the Bank, it would be, perhaps, nearer 120 millions?—I am not responsible for bullion; that I cannot say anything about.

11,474. (*Mr. Hambro.*) In the amount of silver that you say you coin every year, do you include the worn silver that you have?—It includes all our issue, whether from re-coinage or from bullion.

14,475. (*Mr. Le Marchant.*) Are there any estimates of the relative volumes of gold and silver currency in 1798 as compared with the present day?—Lord Liverpool estimated the silver currency in circulation at 3,960,000*l.*, and the gold at 30,000,000*l.* as a maximum.

11,476. With regard to the issue of silver coinage, do you observe that it varies with the course of trade? If the manufacturing trade is busy and wages high, do you observe a greater demand?—Yes, I should say that, when trade is active and there is more wage-paying, there is a larger demand for silver.

11,477. Possibly that demand may not come so directly to the Mint if the Bank of England has accumulated silver returned to it from circulation; it may thus have a store which would meet occasional demands to some extent?—I imagine that the Bank of England always has a store of silver, they sometimes have more than they want.

11,478. Would you take it that the banking machinery in England is so far perfect that a redundancy of silver coins flows back quickly through the banks to the Bank of England?—At certain seasons of the year I should say so, but it is rather a question for the Bank of England. I should say that after Christmas, for instance, when there is generally a large issue of new silver, by the end of January or thereabouts, the Bank of England would probably have a great deal of the Christmas issue flowing back to it. But you can get that from the Bank.

11,479. The question never arises of the Mint being asked to take silver back?—No, except worn silver; but there is no obligation on the Mint to take that back. That is done without legal obligation, in order to keep up, you may say, the reputation of the coinage.

11,480. (*Mr. Holland.*) In view of the increased profit which the Chancellor of the Exchequer now derives from the increased circulation of the silver coinage because of the present price of silver, I should like to ask you whether any attempt has at any time been made to stimulate the circulation of silver?—I do not think the Chancellor of the Exchequer gets any increased profits through an increased circulation of silver resulting from the low price.

11,481. But the Mint derives an increased profit, and that benefits the Chancellor of the Exchequer?—Not, I think, from increased circulation owing to the low price, but from increased profit on the low price of silver, combined with increased circulation due to well-known causes.

11,482. Of course, if the price of silver is low, that would be another factor of the increased profit, but you are not aware of any stimulus having been applied to increase the circulation?—No, I am not.

11,483. I suppose it is the Government who bear the loss on worn silver?—Yes.

11,484. Have you any evidence of the unpopularity of large silver coins in this country?—I have heard individuals say that they do not like the five-shilling piece very much.

11,485. And they refuse to take it?—There is no legal power to refuse it.

11,486. But they avoid taking it?—I think some people do, but that is a matter of individual taste.

11,487. Do you think illicit coinage can be detected with certainty, when silver is used?—I cannot speak from experience in this country, because we have had, practically, no cases of it. We have had no experience of it, so I can hardly answer that.

11,488. The use of pure silver would be likely to increase the difficulty of detection?—That in itself would not be sufficient. There are many other points to be taken into consideration besides the metal of which the coin is made.

11,489. If the difficulty of detection were increased by the use of pure silver, is it not conceivable that the reduction in the number of convictions might have arisen from that cause—because of the increased difficulty of detection?—I should say that the decreased number of convictions had nothing to do with the use of silver at all, because we have had hardly any case where standard silver is used. The cases which the police have under their eye are cases of base metal. We have no reason to suppose that there is any amount of coinage in circulation which is composed of standard silver at all. There have been a great many stories in the papers as to silver coins being made abroad, and being imported into this country. The police have made enquiries, especially at the ports where they were supposed to have come in, and have been quite unable to trace anything of the kind.

11,490. You gave us some instances of the fluctuations in the issue of silver coins, the lowest being in 1889, and the highest in 1888?—1889 was the first year that the Government undertook to pay the carriage of silver; that was one reason why there was an unusually large amount sent out.

11,491. You told us that, in your opinion, if the supply of silver coins should be restricted, there would be no difficulty in silver coinage being unlimited tender. If you restrict the supply, you may give unlimited tender to token coinage?—I said I thought there was no reason, according to the question put to me, why, if the silver token coinage was carefully restricted, it should not be unlimited tender.

11,492. Then, are we right in accepting it as your opinion that, in the case of token coinage, some limitation is necessary, either in the supply of coins on the one hand, or in the limit of tender on the other, and that either would effect the same object?—Yes. I should say you must have a restriction, otherwise you would come back to the old bi-metallic system.

11,493. (*Mr. Hambro.*) Do you always coin as many 10*s.* pieces as are asked for? Are you bound to coin 10*s.* pieces?—It is not stated in the Act that we should do so—the Act says "Where any person brings "to the Mint any gold bullion, such bullion shall be "assayed and coined, and delivered out to such "person without any charge," &c.; it does not specify either sovereigns or half-sovereigns; but, as a matter of fact, we are generally rather shy of supplying half sovereigns if we can avoid it, because they are so much more expensive to keep in repair; they wear so soon.

11,494. It is not with the object of making more silver coins?—Oh, no, that has never come into consideration when the Bank has asked us for half-sovereigns.

11,495. (*Mr. Holland.*) In the abstract of your proposed evidence which was circulated to us, I find this: "Conditions under which sovereign are coined else-"where than at the Royal Mints in London." I am not aware that you have told us what are the conditions under which sovereigns are coined in the Australian Mints?—The conditions are somewhat different. Here the Mint is open to gold free of all charge whatever. In the Australian Mints they have charges for coining, for assay, and refining charges. There are other differences between them and ourselves. They are not allowed to make their own dies. All the dies are made in this country. When worn out, we supply fresh ones.

Mr. H. Seymour, C.B.

10 Jan. 1899.

11,496. So that the conditions for the coinage of gold are more favourable to the public here than in Australia?—Yes.

11,497. And notwithstanding that, you say that 40 per cent. of the sovereigns in circulation here were coined at the Australian Mints?—Yes.

11,498. (*Mr. Campbell.*) With regard to the quantity of silver coined in the 10 years, the average of the two figures that you gave would be one and a half millions annually?—Yes.

11,499. May we take it that that is about the average?—I should say it is rather above the average. I should think it would be nearer one million than one and a half millions. The average of the 10 years I have mentioned is 1,189,000*l.*

11,500. Then that includes coinage for Colonial use?—Yes.

11,501. Have you any record of how much of that represents coinage for the Colonies?—We publish every year a statement of the amount that goes to the Colonies. I can put that in, if you like.

11,502. I should like the amount coined for actual use in the United Kingdom, separate from the Colonies?—I can easily give it you. You want me to confine it to the United Kingdom, and to leave out the Colonies altogether.

11,503. Or you can tell us how much of that amount is for the Colonies, and we can make the calculation for ourselves?—The figure that I gave just now of 1,189,000*l.* as the average *coined* for the 10 years does not quite correspond with the average amount *issued*, which was 1,192,000*l.*, and of this 287,000*l.* a year went to the Colonies.

11,504. That leaves about 900,000*l.* a year for the United Kingdom?—Yes.

11,505. Now, as regards the difficulty of detecting illicit coins made of silver, could they not be detected by analysis?—Undoubtedly. You can assay the coin and ascertain the composition of it; and supposing it was made with a proportion of silver, you would tell that proportion by assay.

11,506. Not only that, but, before coining, does not the Mint put silver through some process to eliminate certain impurities in it?—We simply buy our silver in the market and add the alloy to it. We buy it fine.

11,507. (*Sir F. Mowatt.*) Is your alloy any secret?—No.

11,508. But is it known what it is? The people making the illicit coinage would know the alloy with which to mix their silver?—Undoubtedly.

11,509. (*Mr. Campbell.*) The reason I asked was, that some of these cases of illicit coinage in India were said to have been detected by analysis, showing the presence of zinc in the coins, the inference being that the Bombay Mint took some step before coining to eliminate the zinc. I am told that the reason of eliminating the zinc is that the presence of zinc makes the silver more brittle and apt to crack. Is that so?—Quite true.

11,510. The process of coining illicit money out of silver would be a very expensive one, would it not—the apparatus would be very expensive?—Certainly; a press is a very expensive article.

11,511. There is not only that, but there is the making of the dies?—Also the making of the dies. You want a good engraver—in fact, in this country it is probably a difficult thing to get a good engraver, because a good engraver would not be inclined to enter upon illicit practices of this sort; in any case you would have to pay him a good deal.

11,512. And, as there is such expense and difficulty attending it, you would not expect to see much illicit coinage made of standard silver?—No; I think those considerations stand in the way of it a great deal. Of course, if you use steam machinery, it makes a good deal of noise; the action of the machine in stamping the coin makes a great noise. This also deters persons from setting up a press.

11,513. Now, the Government is not under legal obligation to convert silver back into gold?—No.

11,514. Silver is legal tender to the extent of forty shillings?—Yes.

11,515. But the Government is in no way bound to give gold in exchange for it?—Certainly not.

11,516. (*Sir F. Mowatt.*) And never does?—No, except in the case of worn coin withdrawn from circulation in bulk.

11,517. (*Sir J. Muir.*) Suppose that standard silver such as you use were used by coiners, how would you discover that the coins were illicit?—As I say, we have had no experience of it, so I cannot very well answer; but it is certain that in the form of the coin and the way that the dies are made, and so on, it will differ from the true coin.

11,518. You might be able to do it; but over the country generally, the Banks of England, Scotland, and Ireland, how are they to discover whether it is illicit or not, if it is the same standard as your metal?—I think an expert would find a flaw somewhere, in the milling, for instance. I do not say for a moment that the public might not be taken in, but I do not think that experts would, either at the Bank or at the Mint.

11,519. You were to give us some information about "countries which still retain silver mono-"metallism or open their mints to both gold and "silver." What are the countries to which you refer as retaining silver?—There are a few countries now on a silver basis, but these are not of the first importance.

11,520. You refer to countries that open their mints to both gold and silver. Which are those?—There are no bi-metallic countries which open their mints to gold and silver; as far as I am aware, the only country which has its mints open to gold and silver is Mexico, but that is a monometallic country.

11,521. That is the only one you know?—That is the only one I am aware of at the present moment.

11,522. (*Sir D. Barbour.*) Did I understand you to say, in answer to Mr. Holland, that in the case of subsidiary coinage it would be sufficient either to restrict the supply or to limit the amount of its legal tender?—I said that, as far as you had a real restriction on your issue, I thought that would be sufficient.

11,523. But you did not say that, not restricting the issue, but limiting the amount of legal tender, would be sufficient?—I did not understand that I was asked that question.

11,524. (*Mr. Holland.*) I put it to you that it was an alternative form of limitation?—There are several forms of limitation. The limit of tender is one; the limit of issue is another; and so on.

11,525. (*Sir D. Barbour.*) But what I wish to ask you is this:—is not the limitation of supply the essential limitation?—I should say so.

11,526. If the supply was unlimited, limiting the tender would only produce very great confusion?

(*Chairman.*) It would cease to be a token coinage if the mintage was unlimited.

(*Sir D. Barbour.*) It would, but with a complication?—If you limit the issue, it seems to me that you take an important step towards constituting a token coinage.

11,527. That I do not object to, but do you say that, without limiting the supply, a mere limitation of the amount of legal tender would be sufficient?—Oh, no; I did not say that.

[The witness withdrew.]

Adjourned.

TWENTY-SIXTH DAY.

Wednesday, 11th January, 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR.

Sir JOHN MUIR, Bart.
Sir FRANCIS MOWATT, K.C.B.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. EVERARD HAMBRO.
Mr. W. H. HOLLAND.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

Mr. ROBERT BARCLAY called and examined.

Mr. R. Barclay.

11 Jan. 1899.

11,528. (*Sir F. Mowatt.*) You are, I believe, the senior partner of Messrs. Robert Barclay & Co., of Manchester, and of Messrs. Barclay, Mackintosh & Co., of Buenos Ayres and Monte Video?—I am.

11,529. Besides River Plate business, your Manchester firm also does a large business with India?—Yes. I may add that I resided in Buenos Ayres for 13 years.

11,530. Have you been resident in India at all?—Only as a visitor.

11,531. But you have conducted, or been intimately acquainted with, the business of your Manchester firm with India?—Yes; for the last 20 years.

11,532. You have also been, I think, for 15 years, a Director of the Manchester Chamber of Commerce, and you are at present its President?—Yes.

11,533. The main object of your appearance before us to-day is to support the resolution of the Manchester Chamber of Commerce which Sir F. Forbes Adam has already put before us?—That is my main purpose.

11,534. That resolution it may be as well to read:—"That it is neither possible nor expedient to "establish a gold standard with a gold currency in "India, under the peculiar financial relations and "economic circumstances of the Dependency; and "that, in the opinion of the Chamber, it would be "well, in the interests of India, to adopt the principle "that the mints should be re-opened to the coinage of "silver, the time and conditions to be hereafter deter-"mined." Now, you say in your Memorandum that you object to the scheme of the Government of India, or any similar scheme, for giving India a gold standard without a gold currency. Is that quite an accurate description of the proposal of the Government of India? As I understand it, it did contemplate a gold currency. In paragraph 21 of their Despatch of the 3rd March, 1898, the Government of India say: "When we have "reached the stage in question, the sovereign will be "a recognised coin of the Empire—in use in its chief "cities, at least; and, as long as this condition can "be maintained, the exchange will be stable at about "16*d.*" I think the plan of the Indian Government contemplates that, by the removal of a certain amount of silver coinage, gold coinage would take its place?—I do not believe it would.

11,535. But it is only fair to the Indian Government to say that what you were just putting was not quite their theory. Now, will you tell us your reasons?—I object to the Government scheme, or any similar scheme, for giving India a gold standard without a gold currency. I object also to any scheme which would contemplate both a gold standard and a gold currency, because I think it would be absolutely impossible to carry it out.

11,536. Perhaps I may ask you at this point to indicate what you consider the main difficulties which would render that impossible?—In all trade with or between the natives even a few miles (Mr. Ralli said 20 miles) from the Presidency, nothing but silver rupees would be of any avail. It might be said that in time the natives would accept gold, but we have to remember the prejudices of the native, with his long traditional experiences of silver money. Even if the cost and other difficulties could be overcome, it would be in no sense a currency available or suitable for India as a whole. The Government scheme and the Lindsay scheme seem to me to be purely artificial, and exposed to many varying circumstances that might lead to their breakdown.

11,537. It would be convenient to ask you to indicate the leading circumstances which you consider might lead to a breakdown of the Lindsay scheme?—Without complete convertibility of the silver rupees into gold, there would be no assurance that the Government could maintain exchange at 1*s.* 4*d.* With liability to complete conversion, the burden upon the Indian Government would be enormous, and a concentration of demands for conversion, such as might arise at a time when there were small exports from India (from famine or other cause), plus a desire to withdraw capital from India, plus stringency in the European money markets, would cause a breakdown. The Government scheme assumes (par. 23, Despatch of 3rd March 1898) that India will always have, at least, such a volume of exports in favour of India as will pay for her imports, for interest on capital invested in India (that I believe is estimated at some 7,000,000*l.*), and the Government's home requirements of 17,000,000*l.* to 18,000,000*l.* If the great body of practical commercial experience is right, as witnessed before this Committee, (and I agree with it), I believe this assumption is too sanguine, for India will be handicapped in her industries with China and all silver-using countries. I would add that in recent years the exchange rates have been greatly helped by fresh gold borrowings on the part of the Government. Also by some fresh investment of capital which has taken the form (1) of exports of silver to India, part of which, at least, has been used for monetary purposes; (2) of leaving accumulated profits in India.

11,538. Would you explain that? Do you consider that part of the silver that has been imported into India since the closing of the mints has been used for monetary purposes?—Yes.

11,539. Has it found its way into the coinage?—No; in bars.

11,540. For purposes of barter?—Yes. Now the Government cannot always go on borrowing gold, and, unless the economic conditions of India appear favourable, people will be indisposed to make fresh investments in India. Again, if convertibility is undertaken, as it must be, and the natives, following the example of the Government, should prefer gold, they could at any moment break down the Government scheme if they demanded the conversion of the rupees they hold. Sir A. MacDonnell (Answer 5769) says 75 per cent. of savings are in coined rupees. The savings of the natives,

Mr. R. Barclay.

11 Jan. 1899.

according to Mr. Harrison (Herschell Evidence, page 308), were Rx. 300,000,000, so, if Sir A. MacDonnell is right (which I doubt), they could demand Rx. 225,000,000 of gold from the Government. But at any rate, in the aggregate, they could demand a large sum.

11,541. Practically, I may take it, you think convertibility would be essential, and any attempt to ensure convertibility might entail on the Government so enormous a demand for gold as to break down either the Lindsay scheme or the Government scheme?—Exactly. Both of these schemes have been obviously conceived chiefly in view of the wants of the Indian Government, and they ignore, to a large extent, the interests of the people of India, and the immemorial monetary usages to which they have been accustomed.

11,542. I do not want to press you upon that, but is that absolutely so? Has not the Government, at all events, protested that its objects were greatly to assist the trade of India by creating confidence and keeping up the rupee at a price which would give confidence and attract gold?—Their chief concern, as disclosed in their Despatches, is to secure and maintain a 1*s.* 4*d.* rupee. And a leading official of the Finance Department of the Government of India has stated, in a document which has doubtless come under the notice of this Committee, that the main object of the proposals is to diminish the loss on the Government's Home obligations. I refer to a statement by Mr. Atkinson, an official of the Indian Financial Department. He says: "So far as the Government is concerned, "the main object of a gold standard for India is to "obtain fixity of exchange for the rupee in its "relation to the sovereign within defined limits, in "order to diminish, as far as possible, the loss "on India's gold obligations to England, while a "minor benefit desired is to encourage capital to "enter the country for permanent investment, and "thus assist its development."

11,543. You do not put that forward as an official pronouncement of the Indian Government?—No, that is based on the general tenor of the thing.

11,544. That is a personal statement of an official connected with the Accounts Department, but it does not profess to be a pronouncement of the Indian Government?—Quite so. It is not put forward as an official paper, but it seems in an official form.

(*Mr. O'Conor.*) It is absolutely unofficial.

11,545. (*Sir F. Mowatt.*) However, you put it forward for what it is worth?—Quite so. It is a mistake to link the maintenance of the standard of value of India, or of any country, with the incidental and varying circumstances of exchange, or that this should depend upon the action of the Government in controlling the currency, by operating in exchange. The currency should be automatic, as it was before the closing of the mints, not depending in any degree upon the action of the Government. Let us suppose that the Indian debt was altogether an internal debt, and that the obligations in connexion with it, in common with the other debts of the Government, were payable in India in rupees, just as the English Government pays all its debts in England in sterling. This would not affect the balance of trade. The country would still have as much of its productions to export, and as much of the productions of other countries to import. If more were exported than imported, the balance of indebtedness would be in favour of India. If the reverse, the balance of indebtedness would be against India. At this point India formerly, with her automatic silver currency, could always adjust her balances. The balance, which was usually in favour of India, was adjusted by imports of silver, which, with open mints, laid down rupees in India at a lower rate than that ruling for bills, thus equalising the rates.

11,546. You will pardon my pointing out to you that that argument is founded on the assumption that the Indian debt is an internal debt; unfortunately, as a matter of fact, it is not?—This is not an argument, I am putting this down as a statement. I wanted first of all to clear up this matter of the balance of trade; I will come to the argument presently. If India had had an adverse balance of trade to liquidate, and the exchange rate fell, owing to the demand for remittance bills being more than the supply, then the adjusting process would have been to export silver rupees, and in the old time, with a steady ratio between silver and gold, this process, as well as the contra process, which generally fell to be pursued, would have limited the variation of exchange rate to the cost and charges of exporting or importing the monetary metal.

11,547. What is the period in which you consider that the ratio between silver and gold was steady?—I mean before the disturbance began in 1875.

11,548. Before 1875?—Before 1875. As banks began to enter upon exchange business, they discharged a very useful function in equalising exchange rates over the dull season for exports, and otherwise serving the interests both of exporters and importers. The peculiar position of matters also, since the time when, as indicated by your first witness Sir James Mackay, Indian troubles as regards exchange first began—say, in 1875—(that is the practical year; Sir James gives an earlier date), quickly developed a new and important feature in the operations of the exchange banks in the business of fixing and securing the rate of exchange for forward transactions. The system of telegraphic transfers in place of bills has also been an important development. I have referred to these matters because the action of the Indian Government in selling council drafts, and the action of the exchange banks in buying those drafts for the *legitimate* purposes of their business, are so mixed up with the matter of exchange as based on the exports and imports of the country, that I think it is well to keep the bare substratum of importing and exporting, and the minimum of bill transactions or transfers necessary in connexion with it, clearly before the mind. Exchange banks, as commerce developes, will always be necessary in connexion with foreign business, and foreign governments who have debts to discharge will always have to remit or be drawn upon; but, beyond providing for their outside obligations, there should be no interference on the part of the Indian Government with exchange.

11,549. I will ask you one question upon that. I do not understand you to contend that the Indian Government may not properly either get the best price for their bills or hold them back till the proper time?—What I mean is this: I have had experience of countries where this is done, and all the operations of exchange were done through brokers who were sellers of bills and buyers of bills. Any attempt to sustain exchange when it is tending downwards, by the Government manipulating Council bills or otherwise, is a most dangerous interference. It may seem only an equalising adjustment, to tide over a passing depression; but the mere fact of the Government becoming an operator may bring new factors into play, and unforeseen consequences might result, as it would serve as a pivot round which speculation might play. I saw this result in Buenos Ayres at the end of the year 1884. For a few years, the paper currency there had been convertible into gold at par, and, as the course of the European exchanges was revealing the danger of convertibility being lost, the Government determined that it would sustain the European exchanges by selling bills against the large credits in Europe which it then had. The process went on in the months of November and December 1884. The Government, chiefly through the National Bank, became a taker and seller of bills; but the demand upon it as a seller was insatiable. The whole commercial world of Buenos Ayres wanted to remit, for most people saw, in spite of the protestations of the Finance Minister, that forced currency would come, and, besides funds falling to be remitted in ordinary course, borrowed every dollar

they could, so as to save themselves, as far as possible, when the crash came; and it did come early in January 1885, when a decree giving forced currency to the paper money came out, and a premium on gold of about 25 per cent. was immediately demanded, and exchange, which, while the Government had been selling, had been at 47½*d.*, also fell to about 38*d.*

11,550. What is your opinion as to the effect of withholding the sale of the Indian Council Bills which was tried during the six months of 1893, for the purpose, as you contend, I think, of sustaining exchange rates?—I was then concerned, with some other people, about the peculiar results of the action of the Government at that time, such as the falling off of shipments of produce from India, and I thought it out, and the following is the process by which I arrived at a conclusion. I formulated it in my own mind in this way: (1) Keep in view that all funds or floating capital in bank balances must have a tangible embodiment somewhere in material things.

11,551. Must that necessarily be so?—Necessarily.

11,552. If you say that such funds give a power to purchase things, I understand it; but that is not the same as being "a tangible embodiment"? — With regard to all balances, there must be something behind them to come at, unless you have bogus bills.

11,553. Is it not that such funds have the power of commanding goods? Are they an embodiment of those goods?—There are two things referred to. I am referring to the fund afterwards. This is the proposition that I want to be kept in view.

11,554. I only want to get at what your view is?—Just so. (2) The fund in India which meets the Council drafts is the result of taxation. (3) The taxation is paid by the people out of the money they get for their crops. (4) That money has its tangible equivalent in a certain quantity of produce.

11,555. Again, I accept that from you, but that is merely your own statement?—Yes. (5) Its retention in India has just the same effect as the holding back of so much produce. (6) When the Council drafts against it are sold, the right of the Government to the produce which that money fund represented is surrendered to the buyer of the bills, and it is shipped.

11,556. That is, the produce is shipped?—The produce is shipped. The problem I had to solve was, Why is this produce held back? And this is the way I solved it. The matter will be still clearer if we eliminate money altogether, and suppose that the taxes are paid in produce.

11,557. There, again, I must call your attention to the fact that they are not paid in produce, which appears to make a considerable difference?—What is the ryot paid in, where does he get his money? From his crops. I am making a supposition. I say, if we eliminate money altogether, and suppose that the taxes are paid in produce, if the Government retained that produce and stored it up in India, it would not, of course, appear in the exports; but, if the Government exported it, and from the proceeds, when sold in England, paid its debts there, it would mean the same thing as the sale of Council drafts.

11,558. But that, again, would eliminate all question of currency?—I am simply telling you my solution of the problem. The avowed methods by which the exchange rate proposed is to be secured are not only bad in these ways, but also objectionable in the incidence of their operation. To contract the currency of a country with the view of reaching or maintaining a given foreign exchange rate is not a thing which the Government of any European country with a sound currency would ever contemplate.

11,559. A sound currency in Europe would be a gold currency?—Yes, or it might be, as in France, a bi-metallic currency. Of course they have gold there chiefly, but I am referring to any sound currency.

11,560. One effect of that being in gold would be that gold would flow very readily both in and out, in accordance with the demands of the moment in Europe? — Yes. It is only in connexion with inconvertible paper currency depreciated through over-issues that such operations are ever conceived.

11,561. Would you say that it would be equally true with an inconvertible silver currency depreciated through over-issues?—Of course it would be just the same thing, if it were that. And to regard complacently the carrying out of such arrangements with regard to the silver money of India shows that the authors of the Government proposals now regard that money in the same light as a forced paper currency. If it really is so, it is a sad consummation quickly reached of the policy of closing the mints; and, if the natives of India came to believe that the silver money of India had been reduced to exactly the same position as the paper money, of which they are still so sceptical, and that paper notes of no intrinsic value might be silently substituted for it, it might be serious indeed, and they would be inclined to believe the agitators who are even now telling them that these changes are a device of the Sircar for robbing them of their silver money.

11,562. The issue of notes in lieu of rupees and the withdrawal of rupees for that issue are not a part of the Indian Government's scheme?—No, but we know that the power is there now, and they are very jealous of it. But it is not the same thing as an inconvertible paper currency. The position of silver in India, as a thing of value intrinsically, is still something essentially different from the position of paper money in a country where it has forced circulation, and the matter of redundancy or scarcity can only be gauged in an entirely different way. The quantity of paper money in circulation in forced paper countries can be exactly measured. The quantity of silver money and potential money in uncoined silver in India, with all deference for those who have given estimates, I think, cannot be measured.

11,563. You speak of uncoined money in India now as "potential money;" but, since the closing of the mints, it is hardly potential money now, is it?—It was potential money. The natives formerly used their ornaments for money. It was potential money formerly.

11,564. You mean, used them in the sense of currency?—They went and had them converted into currency. They were potential money, just as I would say that gold bars are potential money. It is in that sense.

11,565. But since 1893 they cannot so convert them?—No, that is the real difficulty; but still the tradition holds in the country. The quantitative theory, as regards forced paper currency, is simple; and, if contraction is desired, so as to give increased value to the notes, it is quickly attained by withdrawing and burning so many of the notes. In the case of the silver money of India, however, the facts of the case, as to whether there is actual scarcity or redundancy of the currency, are, first of all, much more difficult to judge, in view of the habits of the people with regard to silver and silver money; and it is the entire area of India, with all the innumerable channels through which silver percolates, and not the mere pressure at the ports, that must be kept in view. The operation of artificial expedients, intended to produce either scarcity or redundancy might, I think, readily fail in their intended effects, and very likely produce evil consequences in other directions. I think the conflicting evidence of experts whom you have examined on the question of redundancy and scarcity is due to these difficulties. The concrete case of a forced paper currency was, perhaps, before the minds of some of them; but the silver money of India is a very different thing, with the vast area over which it works, and its intimate identification with the saving habits of the 300,000,000 of its people, and theories applicable in the one case cannot be applied in the other. The system which prevailed before the closing

Mr. R. Barclay.

11 Jan. 1899.

of the mints suited India admirably. In the imports of silver she got what she wanted in liquidation of the balance of trade, and a large portion of this silver, which was all at first minted, remained in the currency, but no more than was necessary to meet the growing wants of an increasing population, and an ever expanding trade. Many circumstances at the time prevented the effects of the change from being seen, but latterly, and especially during last produce season, the results have been painfully visible, not only in the high rates for money which prevailed for an unprecedentedly long period, but also in the practical impossibility of obtaining it for purposes of trade; and I think it is the crying want of India that this state of matters should be rectified by a reversion to the old system, rather than aggravated, as it would be, by the Government scheme.

11,566. I understand that you consider that the high rates for money which prevailed for an unpleasantly long period, and the practical impossibility of obtaining it for every purpose of trade, were the result of the system which had curtailed the currency of the country?—Exactly.

11,567. And that curtailed currency found a necessary result in the high rate of discount and the impossibility of borrowing?—Yes.

11,568. Now that curtailment of currency still remains,—to a certain extent intensified by the wear and tear of the silver?—Yes, and there is not the addition going on.

11,569. Therefore, one would have expected that, if that was the inevitable result of that system, the result would be intensified in the present season?—Yes.

11,570. That is not the case, I think, is it?—It is only beginning yet. Already it is advancing.

11,571. Do you recollect the rates of discount which were charged during these months of last year? They were about 11 per cent., I think. Now, I understand, they are 6 or 7. If that was the inevitable result last year, it should have followed, should it not, that it would be intensified this year?—Not necessarily. There are a great many considerations that come into play—the famine and the immense area of India.

11,572. (*Chairman.*) Come into play, do you mean, this year or last year?—I mean always.

11,573. Then the force of your preceeding argument is subject to that?—Quite so.

11,574. (*Sir F. Mowatt.*) I wanted to get that clear, because it is rather an important point with us. You do not, as I understand, attribute the rise in the rate and the impossibility of borrowing solely to the system of curtailing the currency. Many other considerations come into play?—I was referring to its affecting current rates in India. As regards the proposal of the Indian Government, the advantage to India of a steady exchange in giving confidence to foreign capitalists and security for investments would no doubt be very great, but confidence would not be obtained if a 1*s.* 4*d.* rupee were sought to be established in the way proposed. There must be, not only the visible fact of a steady rate for some time, but also confidence in its maintenance; and, although the rate kept steady for a time, if it were seen that this was only secured by constant effort and manipulation on the part of the Government, confidence, I think, would not grow.

11,575. There again I should like to ask you this, because it is rather a crucial point. The two conditions are, first, that the rupee should be maintained for a considerable time at a fixed rate, and, secondly, that there should be confidence that the Government would be able to maintain that rate. As regards the first condition, do you accept it that the rupee has now for nearly 18 months been at or about 1*s.* 4*d.*?—Yes.

11,576. Therefore, the remaining condition to make the change possible is that there should be confidence in the Government's power to maintain it?—Quite so.

11,577. Would you say that, the longer the rupee is maintained at that rate, the greater would be the confidence that they would succeed in maintaining it permanently?—Yes, decidedly. But a rate artificially maintained in the way proposed is a very different thing from what a steady rate resting on an automatic currency would be. I am drawing a comparison between a rate which is always looked after and seen to be maintained, and one which would be automatic. The evidence taken before the Committee, as far as it has been published, shows that the majority of the witnesses, including many who now favour a gold standard, regret that the mints were closed. Our Manchester Chamber did its utmost in opposing the action taken in 1893, and now thinks that there is no way in which matters can be put right permanently but by undoing what was then done, and, as a first step, deciding that the mints should be reopened to the coinage of silver as formerly.

11,578. I understand that you recognise that some of those who in 1893 thought that the mints should not be closed have so far changed their opinion that they think that under the existing circumstances it would not be wise to go back and reopen the mints?—Quite so.

11,579. (*Chairman.*) But that is not the opinion of the Manchester Chamber of Commerce?—No.

11,580. The Manchester Chamber of Commerce still adheres to its opinion that the mints should be reopened?—Yes. We consider that a grievous injustice was done to the people of India when the mints were closed. The functions of silver in India were, and still are, of a unique character, and the standard silver money of India was far more to the people of India than the standard money of European countries is to their peoples. In a fully developed country such as England, credit money in bills and all the appliances of modern commercial life come in to facilitate the transference of commodities and property in whatever form they may exist, and in the international trade of India these devices also come into play. But in the vast internal trade of India, which is of infinitely greater extent, they are almost, if not altogether, absent; money in the primary form of coin of intrinsic value serving all the purpose of trade, both as medium of exchange and standard of value. Up to the closing of the mints, as regards its internal trade, India was admirably served by its silver money. It was automatic currency, and a true measure of value. The people of India had unbounded confidence in it. They hoarded it in coin, and converted it into ornaments, not, I believe, so much for display, as for security in preserving what was to them their liquid capital, for the ornaments could always be readily converted into coin as long as the mints were open.

11,581. (*Sir F. Mowatt.*) You said first of all that the closing of the mints acted as an injustice to the people who hoarded coin and ornaments, and you say that they hoarded their ornaments, not as ornaments so much, but as practically a deposit in the savings banks?—Yes.

11,582. Upon that I suggest to you that, when they could hoard coin or buy silver, and change it into ornaments, if their purpose was to hoard as a matter of saving, the coin was a much simpler way of doing it. Therefore, I suggest to you that they bought ornaments really as European ladies buy ornaments, because they liked them?—I believe differently. I think the main object of so many ornaments in a family was to have the silver to keep.

11,583. In preference to the rupee?—Oh, yes. It goes back to very ancient times, when India was very much convulsed with frequent wars, and the people were always in terror of being pillaged. I believe a great deal of the hoarding of ornaments in India had its origin in the custom of the people keeping silver about them, so that they could use it when quiet times returned. In that way they got into the habit of burying it, and the money in form of ornaments they had about them was more easily carried.

11,584. And more easily pillaged?—Yes, but of course they would try to get off in time.

11,585. Now one other question about that. You alluded to the evidence given by Sir Antony MacDonnell, to the effect that the hoarding in coin was considerably more than the amount hoarded in ornaments, and I think you founded an argument upon that?—Yes.

11,586. I suggest to you that, if the rupees are hoarded when they are below 1*s.* 4*d.*, then, when the Government forces the rupee up to 1*s.* 4*d.*, it makes the hoarder very much richer instead of very much poorer?—Possibly he got these rupees when the rupee was of a very different value altogether. They may be very old hoards upon which the loss is made.

11,587. (*Chairman.*) But what you are asked is, is not the raising of the rate a benefit to the hoarder?—So far, yes.

11,588. Do you say that it is an injustice to the people of India?—I did not quite endorse the opinion expressed by Sir Antony MacDonnell.

11,589. (*Sir F. Mowatt.*) If he is right in saying that, on an average, two rupees are hoarded for every one ornament representing a rupee in amount of silver, then any course which raises the rupee from 10*d.* to 1*s.* 4*d.* has put that hoarder in a much better position than if it had been allowed to fall to 10*d.*?—Yes; that is so far as the gold measure is concerned, apart from the value of it.

11,590. If a man has hoarded a rupee which would have fallen to 10*d.*, and he now gets a rupee that is worth 1*s.* 4*d.*, he is no poorer. I will not put it higher than that, if you like?—Just so. As regards hoarding ornaments, my belief is that it is a loss to the natives; that they have suffered from that. There is no doubt that they cannot get the same money for these ornaments that they formerly could get.

11,591. As to that, I should like to draw your attention to a question and answer given by Mr. Cheetham, who was here arguing in favour of the reopening of the mints. I am reading from Question 8809: "If it is impossible almost to get rupees now, "how could you expect to draw, say, 300,000,000 of "rupees from the currency in order to draft away the "Government gold?—(*A.*) Because at the back of the "currency in circulation is an unknown hoard of "rupees. In the evidence of Sir Antony MacDonnell "he says that the great bulk of the savings of the "people of India are in rupees, and not in ornaments. "That coincides with independent evidence that I have "got; I must say that it was a great surprise to me to "hear it." Now will you proceed?—No doubt the basis of international trade with gold standard countries had been seriously upset ever since the year 1875, and there was danger both to the Government and ultimately to the people of India in the uncertain relation of silver to gold that resulted after the closing of the French Mints, which up to then had maintained an even parity of value between gold and silver. Up till 1893, however, this aspect of the question had not forced itself upon the vast mass of the natives of India. They had their immemorial money in the form of silver rupees, which they could hoard or melt and reconvert, and in this tangible form the millions of poor peasants could see and make sure of the liquid capital in money which they possessed. The people generally did not at once realise the importance of the change in the monetary conditions throughout India which the closing of the Indian mints brought about. The millions of peasants were not in the habit of resorting directly to the Government mints to get their bangles coined; they went to the silversmiths, and, as their needs led them to go there to get rupees for silver ornaments, they found after 1893 that the conditions under which the silversmiths could buy them were altogether different from formerly, and they could not get more than half or two-thirds of their former value in relation to rupees. The converting of rupees into ornaments, along with the practice of hoarding coin, was much the same as the depositing of small savings in banks by the people of this country; and we can realise in some measure what the closing of the mints must have been in this respect to the peasantry of India if we suppose that, by an arbitrary decree, the English Government were to confiscate one half of a large portion of the savings which the working classes had in the Savings Banks.

11,592. I suggest to you that, on the view I have been mentioning, you must put it, "if we suppose "that by an arbitrary decree the English Government "were to add about one-third to the large portion of "their savings which the working classes of England "had in the savings banks"?—No, no.

11,593. If the hoarding in rupees is twice as much as the hoarding in ornaments ——?—I say a large portion; I have guarded my language there.

11,594. I am suggesting to you that, if the hoarding in rupees is twice as much as the hoarding in ornaments, and if any action of the Government halves the value of the ornaments and doubles the value of the hoarded rupees, then the action of the Government would be to add about one-third to the large portion of their savings which the working classes have in the savings banks?—Well, you may put it in that way, if you like; but, as I have already said, that is looking at the coined rupees from the point of view of their gold value, which does not affect my contention.

11,595. I only ask you the question?—The point I have chiefly in view is with regard to the ornaments.

11,596. (*Sir J. Muir.*) I think Mr. Barclay does not acknowledge that the rupees exceed the ornaments to the extent you indicate.

(*Witness.*) I think the evidence altogether with regard to quantity is very vague. I have letters from people who have written to me privately about it, putting the quantities very much higher.

11,597. (*Chairman.*) By the step the Government have taken they have made what was worth a little more than 1*s.* worth now 1*s.* 4*d.* Now, do you say that the analogous case in this country would be a proposal on the part of Parliament to confiscate one half of the savings which the working classes have in the savings banks?—When the natives go to the silversmith to get rupees for their ornaments, they only get a half, in consequence of the action of the Government. I am not referring simply to this action, but to the closing of the mints as well. The effort of the Government in stopping the sale of Council drafts was to maintain a rate of 1*s.* 3*d.* or nearly 1*s.* 4*d.*; it did not go to 1*s.* for some time afterwards. The closing of mints found the rupee very much of the same value as it is at this moment, I think. The price of silver on the 2nd June 1893 was 38*d.*, and that is about 1*s.* 3*d.* for the rupee.

11,598. Now, will you proceed? — While the peasants were in the habit of dealing with their savings in this way, the better classes in all the towns and cities, who also wear large quantities of silver ornaments, would be similarly affected as regards these, and the native bankers in the vast ramifications of their business, in which uncoined silver would no doubt play an important part, must have been seriously affected by the Government fiat which closed the mints. In the nature of things, apart from direct proof of discontent having been engendered, which I am sure an impartial commission of inquiry in India would bring out, it would be contrary to human nature that the natives should remain unmoved by circumstances so generally affecting them as those which resulted from the closing of the mints. And now that further developments of the same arbitrary action are proposed, which may ultimately lead to further interference with, and degradation of, the silver which they have been so long accustomed to, and which was so much to them in all their dealings, it is in the highest degree necessary to pause and beware of the evil consequences that may ensue. We know how careful we have to be in India with regard to all the religious and caste scruples of the people. If their religion stands first in their regard, certainly their silver money and their usages in

Mr. R. Barclay.

11 Jan. 1899.

connexion with it stand second; and if, as I have seen it stated, they are getting the idea that the Sircar or Government is seeking through the legislation to rob them of their silver, the consequences might be very serious indeed. I have referred to the native bankers, as well as to the mass of the natives generally, who are interested in this question. I would respectfully point out that, as the Government of India does not include any form of popular representation, those classes must look to this Committee to safeguard their interests. I may also refer to the statements that have appeared in the Indian newspapers, to the effect that some of the most important of the Maharajahs of the Native States and their finance ministers are deeply concerned at the effects of the closing of the Indian mints. It was reported that these States had proposed to have a conference among themselves to consider the question, but that the Indian Government through the Residents had dissuaded them from this. If it be so, there is all the more reason that any views on the subject which these Maharajahs, or their finance ministers, may entertain, should be fully considered, and that the people of England should know what is the independent opinion of these rulers. These native States embrace a population of about 70,000,000 people. Some of them have both mints and coinage of their own; others have also special coinage, though the coins employed are minted by the Indian Government. I have no doubt that, in view of these arrangements, the Government must have had some communication with them about this matter, and the public relies upon this Committee seeing that the interests and wishes of these States have the consideration to which they are entitled. I may say that general ideas such as I have now expressed were strongly in the minds of the Manchester Chamber's members when it disapproved the closing of the mints in 1893, and we are confirmed by what has happened since in the view then taken. I believe that the only way out of the difficulties in which the Indian Government and the Indian people find themselves, as the result of the action then taken, is to abandon the idea of a gold standard for India, and, as a first step, to decide that the mints should be reopened. In my opinion, what the situation demands is a solution that will give India automatic silver money, in order:—

1. That the supply may be adequate for its growing industrial and commercial needs.
2. That its standard should be the same as other silver countries, so that there should be no monetary advantage in favour of China or other eastern competitors.
3. That the habits of the people in connexion with their silver money should not be interfered with, and the loss which they at present make in reconverting ornaments into rupees should be obviated.

It is necessary that there should also be:—

4. A fixed par relation between the silver money of India and European countries such as the Indian Government aims at.

While I object to the mode in which the Indian Government seeks to carry this out, I quite sympathise with it in its desire to accomplish this object, both for its own special advantage as a large remitter of funds to England, and also for the other commercial advantages that a steady 1*s.* 4*d.* rupee would give. The Government of India, judging from its despatches, concentrates its attention upon these advantages; but the advantages of an automatic silver currency which I have just named are no less important (I would say much more important and absolutely necessary), and, if a scheme could be carried through that would combine both, it would surely be much better for all. The difficulty in the way is the present divergence between the gold value of the rupee and its metallic value, but I believe that, if India decided that the mints should be reopened, forces would come into play that would greatly affect silver in the way of making its gold value approximate to that of the rupee. Until the Indian mints were closed, silver had never fallen below 38*d.* per oz., and I think there is every reason to believe that the mere decision to reopen them would have a great effect upon the present gold value of silver. There is every prospect of an increasing demand in connexion with the opening up of China, and also of Africa, and, if concurrent mintage by the United States on the basis of 42*d.* per oz. or 1*s.* 4*d.* per rupee could be secured as indicated by Sir Forbes Adam, a stable arrangement, suitable for all the wants of India, both as regards the Government and her internal and external trade, might be established. If this Committee will recommend such a mode of settlement, I believe that such concurrent mintage could be arranged.

11,599. You say that this measure will be unpopular in India, and you think that there would be a general feeling against a gold standard and a gold currency in India. Are you aware that resolutions have been sent home many years ago in favour of a gold currency, and that the Bengal Chamber of Commerce declared their opinion that a gold standard was almost universally admitted to be a positive benefit to India, and that a Commission was appointed, and that that Commission took a very wide range of evidence, and reported that the evidence that they had taken unanimously proved the demand for a gold currency?—I know there were several things of that sort, but there were also specific representations made by the Indian Government urging a bi-metallic arrangement.

11,600. I mean apart from the bi-metallic question?—Oh, yes, there was what you say.

11,601. (*Sir J. Muir.*) I have one or two questions that I should like to put to you regarding the evidence that you have given; but, before going to that, I would like to call your attention to a memorial that was sent out by certain firms in Glasgow. You have had a long connexion with Glasgow in former years, have you not?—Yes.

11,602. So that you know these firms that I am going to name to you in a moment. These people profess to be doing a considerable business in India, and they put in a clause in which they say that they, as exporters to India, have as good a right to be heard as the people in India. Now, the first name on that list is J. & W. Campbell. That is a firm you know very well?—Yes.

11,603. What is their business?—It is a very large home trade house. I do not think that they do very much foreign trade; they had not in my days, when I knew Glasgow, any foreign trade at all.

11,604. Their connexion with India was on quite a moderate scale, but they are a leading house in Glasgow as a large wholesale house?—Yes.

11,605. Now, as to the clauses of your evidence to which the Chairman has specially directed your attention, I fancy you may have some information in addition to what you have given us. You say: "I "may also refer to the statements that have appeared "in the Indian newspapers" as to the effect of the closing of the mints. Have you any information that you can give us as to the feeling of the natives? Have you any facts that you can put before us as to the feeling of these Rajahs and Maharajahs that you refer to?—Nothing that I could put in a definite way before you, but friends in India whose veracity I can rely upon have written me informing me that such is the fact, and the fact was also referred to in an article in the "Times" of August 3, 1898, which I will read, if desired. The political dangers involved by causing dissatisfaction at the Courts of the Native Princes and amongst the people of India need no words from me to emphasise it. And I would respectfully urge this Committee to take the practical certainty of such dissatisfaction into consideration, and not to rely upon such information as may be received by the Government of India on the subject, and communicated to this Committee. In the nature of the case, the officials of the Government of India, for whom I have the highest esteem, are the last people to whom the

natives would air such grievances. It is notorious that at the time of the Mutiny the official class were in entire ignorance of any danger, and, indeed, pooh-pooh'ed any idea of it.

11,606. I should like to hear the remarks of the "Times" to which you refer?—This is in an article under the title of "Indian Affairs" in the "Times" of August 3, 1898. It is headed "The Currency Question from a Native Financier's Point of View." "A "significant movement is taking place in the Native "States with regard to the currency question. The "Chiefs realise that, as holders of the largest silver "hoards in India, they are deeply interested in a "measure which has reduced by one-third the rupee "value of their bullion. The financial adviser of a great "Feudatory is said to have sounded the Ministers of "other States as to the feasibility of a Joint "Committee to inquire 'how far it affected their "peoples" and to have asked qualified persons living "in British territory whether they would consent to "serve on it. The project hung fire, but it is now "being urged in the Native Press." It then goes in some detail into other things.

11,607. (*Sir C. Crosthwaite.*) Is that a leading article?—No; it is in the article on "Indian Affairs." It is one of a series of articles always appearing. The writer is very well known as an Indian authority.

11,608. (*Chairman.*) He says, "the project hung fire"?—Yes, the inference is that the Residents objected to it.

11,609. (*Sir F. Mowatt.*) The inference is?—And the knowledge privately is.

11,610. (*Sir J. Muir.*) Information could be got, I suppose, by this Committee as to whether or not the Residents at these Native States had instructions to act in that way?—I believe the only way in which you would get it would be by a Commission out there.

11,611. You say that the silver money of India is more to her people than the standard of European countries, and that the internal trade is much the largest. Can you give us any reliable estimate of the amount of the internal trade of India as compared with its external trade?—No, I cannot, but it is manifestly obvious that it must be immeasurably greater. Though I do not say the circumstances relating to this country are analogous to those of India, yet they must apply to some extent. Now, as regards this country, our exports and imports in 1897 were together 625,000,000*l.* Now, the amount which passed through the London Bankers' Clearing House in that year was 7,500,000,000*l.* Even if we deduct a very large amount of this as arising from Stock Exchange transactions, there would be an enormous sum left pertaining to commercial transactions, and in addition to this several hundred millions sterling passed through the various provincial bankers' clearing houses (Manchester alone was 200,000,000*l.*), and, in addition, there are all the transactions settled by cheques cashed across the counter in London and Provinces, and all the transactions settled in cash throughout the country. I am fully justified in saying that the internal trade of India is immeasurably greater than her external trade. Silver money is what the natives know and prefer, and it is monstrous that the Government should seek to force a gold standard on India because of its 17,000,000*l.* of Home obligations, even though 70 to 80 per cent. of India's external trade is with gold-using countries. Of course, if you gauge the thing, to any country, for instance France, her external trade is a mere bagatelle to her internal trade.

11,612. With regard to the savings of the natives, it has been stated to the Committee that a large part of these is in coined rupees, upon which the natives have suffered no loss by the closing of the mints. With regard to silver hoarded in the form of ornaments, have you any evidence that the sale of such ornaments takes place in time of stress to such an extent as to justify the analogy of savings deposited in an English savings bank?—With regard to country silver and silver ornaments being sold in times of stress, the Indian Mint Reports of the famine years 1876–77 to 1879–80 show that about 34,000,000 rupees' worth of "bullion in the form of native orna- "ments which had been thrown on the market "by sufferers from famine," were received at the Mint for coinage in those years. Resolutions of the Government of India on the Mint Reports included a statement to the effect that the amount of such silver "indicates with a certain accu- "racy the commencement, progress, and severity "of the famine, and the effect it has had upon those "influenced by it." Full particulars are given in an Appendix on page 271 of the Minutes of Evidence of the Indian Currency Committee of 1892–3. The quantities which reached the mints must have been only a fraction of what was sold by the natives to the dealers. Those would be realised at nearly weight for weight in rupees. In the recent famine, when the mints were closed, the silver ornaments, as I have said, would probably only realise about 50 per cent. in rupees. It is common knowledge that, except the destitute, all classes in India possess silver ornaments; but, even on Sir A. MacDonnell's assumption, he admits (Answer 5767) that such sales by the cultivating class were made at a less value than the rupees which had been melted to make them, and this would, of course, injuriously affect the labouring classes, who are, to a large extent, identified with the cultivators. Sir Antony MacDonnell draws a distinction between the labouring classes and the cultivators; I would modify that distinction. That every rupee was required, is shown by the following significant telegram sent by Lord Elgin to the Governor General of Canada during the recent famine ("Times," February 4th, 1897):—"The prompt "sympathy shown by Canada is most warmly appre- "ciated here. The Famine Fund Committee consider "money more useful than grain or other supplies." It is well known in India that several wealthy natives were compelled by the stringency of the money market to make private arrangements with their creditors.

11,613. (*Sir F. Mowatt.*) May I ask what is Lord Elgin's telegram? Is he telegraphing about ornaments?—Not at all.

11,614. You are saying, I understand, that money invested in ornaments is practically depreciated 50 per cent., because the ornaments have to be sold, and, as I understand it, you read in support of that a telegram from Lord Elgin to Canada to say that the Relief Committee would be glad of a grant of money?—Yes, not grain, but money. My argument is that the ornaments and the rupees are money to the natives.

11,615. In other words, there was plenty of grain, but no rupees?—There are those who maintain that the late famine was a money famine and not a grain famine, because there was grain to be had, but no money to buy it.

11,616. Of course, Canada could not send actual rupees. But you do not put that forward as showing that ornaments have been depreciated in value?—Oh, no, I am on a different point altogether.

11,617. (*Sir J. Muir.*) We understand that the Manchester Chamber of Commerce did its utmost in opposing the action of Government in 1893 in closing the mints, is that so?—Yes.

11,618. You are aware that it is alleged that, if the mints were open to silver, India would become the dumping ground for that metal. Have you any observation to offer upon that point?—With the mints of India open under the conditions which I recommend, no such allegations could be made. But I deny the accuracy of the remark being applied even to the time when no great commercial nation had its mints also open to this metal. No silver mine owner ever exported silver to India as a speculation. Those who imported silver into India at such times have been responsible people, mainly the great Indian banks, who did so because they were aware there was a requirement for it; indeed, I may say, there is no commodity the international movements of which are

Mr. R. Barclay.

11 Jan. 1899.

attended by such nice calculations as the precious metals.

11,619. (*Mr. Campbell.*) Sir Francis Mowatt asked you in regard to your reasons for thinking that it would be absolutely impossible to establish a gold standard and currency, and you mentioned the difficulty of getting gold. Did you mean by that that India would have to borrow the gold?—Well, it depends on the quantity of gold she would require to make an actual gold standard and currency.

11,620. Whatever the quantity might be, would there be any difficulty in getting it?—I think it would be a tremendous tax upon her.

11,621. I suppose you are aware that India already commands the precious metals to the extent of an average of about Rx. 12,000,000 per annum?—Yes.

11,622. In that position, should she not be able to command a gold currency, if she wished to, just as readily as a silver currency?—I do not think it.

11,623. You think not?—I think not.

11,624. Why should she not apply the gold she might acquire in that way to currency purposes as well as silver?—Because the people do not take to it. Mr. Ralli said that, in all contracts with the natives within a few miles of the Presidency towns, you would require silver. Gold is a thing you cannot use.

11,625. It is not so much the difficulty of acquiring the gold, as the difficulty of getting it into usage?—That is it; the difficulty of getting it into circulation; but, as I have said, it would also be a tax upon her to get it.

11,626. Then you refer to the Government "operating in exchange." You do not mean, do you, that by drawing on India for the amount of the home requirements, the Government is operating in exchange in an improper or objectionable manner?—No. It is the Government operating on exchange with the view of maintaining it, and the analogy I have in my mind is that which occurred in Buenos Ayres—attempting to maintain exchange. When they saw that gold was going to be exported, the Government determined that they would supply exchange to the importers of goods.

11,627. You refer to the Government's action in holding back their bills?—I wanted to eliminate that. I wanted to bring before the Committee the simple action of exchange.

11,628. Now, in the time of an adverse trade balance, is not that one of the temptations to which the Government is subjected, owing to the violent fluctuations in the rupee exchanges?—Under the present state of things.

11,629. Under the old state of things?—Under what is going on now.

11,630. I mean when silver was the currency—under open mints?—No, the Government had no power at all, as I understand; the Government simply coined rupees.

11,631. But the exchange was liable to very violent fluctuations?—It was liable to fluctuations.

11,632. (*Chairman.*) The Government are not bound to draw Council bills?—They are bound to pay their debts.

11,633. (*Mr. Campbell.*) Is there not a temptation to avoid drawing in order to escape the loss arising from a sudden drop in exchange?—Yes.

11,634. Would not that be an argument in favour of a gold standard and currency as compared with a silver standard and currency, that under a gold standard and currency these evils could not arise; and, therefore, that temptation would not exist?—I do not quite understand your question. Do you mean to keep up exchange, the Government interfering for the purpose of preventing exchange from falling?

11,635. What I mean is that, with open mints and an adverse trade balance, the only way of settling it is by Government accepting a heavy fall in exchange, or borrowing money in order to avoid paying their debts. With a gold standard and a gold currency that objection would not arise, because the gold would be available to be shipped home?—Of course it would be.

11,636. Is not that an argument in favour of a gold standard?—What I propose is a standard that would be the same as gold, while, if the Government had to ship gold home, their gold system whould be endangered.

Adjourned.

Mr. ROBERT BARCLAY recalled and further examined.

(12th January 1899.)

11,637. (*Mr. Campbell.*) In your evidence yesterday you alluded to contracting the Indian currency; did you refer there to the Government's proposal to melt down currency in order to raise the exchange to 1*s.* 4*d.*?—I refer to the whole system of closing the mints—closing the mints is, of course, contracting the currency itself—and also to the specific way in which they were going to melt down rupees.

11,638. That is what you meant when you referred to their endeavouring to raise the exchange to 1*s.* 4*d.*?—Yes.

11,639. Do you consider that, if the currency had been contracted in that way, it would have increased the stringency of the money market which has been complained of?—Yes, I think it would.

11,640. Do you consider that a 1*s.* 4*d.* exchange, established by such means, would have inspired the confidence necessary to attract capital from this country to India?—The fact of its being established by this means, and consequently requiring to be maintained, would not inspire confidence. The people who might be looked to to send money to India may be divided into two classes: (1.) Those who are prepared to enter on any given enterprise or speculation, taking all the risks to which it would be liable, including exchange, under the belief that profits would be realised which would cover all these risks. In their case the conditions might not be so deterrent. (2) The much larger class which consists of those who have large funds to invest, and who will not concern themselves with details of investments. To this class, the fact that the currency of India was maintained by Government management—which in itself implies that it might break down—would be a deterrent.

11,641. You allude to the loss the natives have sustained in selling silver ornaments. Would you regard it as any compensation for that loss that silver for the purpose of ornaments can now be bought very much cheaper than formerly?—Not a compensation for the past loss.

11,642. But suppose a person, under the stress of famine, for instance, had sold his ornaments to-day, would it not be some compensation to him that, if he was in a position later on, he could buy them much cheaper than formerly?—That is a speculation in silver.

11,643. No. Suppose he had ornaments that he had been obliged to part with; if he can get them back for the same money that they realised, that would be a compensation to him, would it not?—Yes, that would be a speculation in silver.

11,644. India has bought an immense amount of cheap silver since 1893?—Yes.

11,645. In the last four years a total of Rx. 27,000,000?—Yes.

11,646. You point to the possibility of establishing a fixed rate of 1*s.* 4*d.* by an international agreement?—Yes, or by an agreement with the United States; that is the primary thing, of course.

11,647. You say it is necessary that there should also be a fixed par relation between the silver money of India and European countries, such as the Indian Government aims at. Later on you mention that this may be effected by concurrent mintage in the United States and India on that basis?—Yes.

11,648. Do you mean that the concurrent mintage by the United States alone along with India would be sufficient?—I think so, but I believe that more could be got to come in.

11,649. You think the United States alone, acting with India, would be sufficient?—Yes.

11,650. What reason can you give for saying that?—I have an intimate knowledge of all the circumstances attending the international negotiations for a monetary agreement in 1897, and I can speak in the most positive terms as to the good faith and desire of the United States and France in those negotiations. But for the then opposition of the Indian Government to any agreement, I believe a compromise might have been arrived at, for Mr. Balfour, the First Lord of the Treasury, in the following statement in the House of Commons on March 17th, 1896, showed that the Home Government were ready to open the Indian mints. He said that, as part of an international agreement, "We will re-open the Indian "mints, we will engage that they shall be kept open, "and we shall therefore provide for a free coinage of "silver within the limits of the British Empire for a "population greater in number than the population "of Germany, France, and America put together." I am aware that the ratio suggested in 1897 was different to that which has been put before this Committee. The latter is 22 to 1, which is equivalent to a 1*s.* 4*d.* rupee, the rate desired by the Indian Government.

11,651. (*Sir F. Mowatt.*) May I interrupt you here just to make this clear? You are aware that the Chancellor of the Exchequer, who spoke for the Government, did not go quite so far as Mr. Balfour did in the extract you have just read?—No, not quite so far.

11,652. I only want to call your attention to the fact that the statement made on behalf of the Government did not go so far as the statement of Mr. Balfour?—That is so; but, of course, those gentlemen had the whole thing before them. Senator Wolcott, the head of the United States Mission of 1897, stated, in reporting the negotiations to the Senate, that, of the contributions desired from England, "All other "proposals, however, were of infinitely small im-"portance compared with that respecting the re-"opening of the mints of India to the unlimited "coinage of silver." And, with regard to ratio, he said: "It may also be necessary, in my opinion, to "make concessions in the ratio, bringing it some-"where in the neighbourhood of 20 to 1, more nearly "approximating the ratios recognised by Russia, "Austria, and India." The Russian arrangement was 23¼ to 1, and the Austrian 18½ to 1, and the Indian ratio which he refers to is 22 to 1, viz., that which the Indian Government said (16th September 1897) is what would suit India. Other prominent American leaders have also in their public statements shown that the feeling in America in favour of a modification in the ratio is pretty general, while as to the desire of the present United States Government for a settlement, notwithstanding the treatment they received in 1897, President McKinley, as lately as the 1st of last month, declared the continued adherence of the Government to a desire for an international agreement for the remonetisation of silver. I may say that this morning I saw a communication with a statement in favour of a modification of the ratio by Senator Jones, of Arkansas, the chairman of the Democratic Convention and a free silverite; and Senator Chandler, a leading Republican from a gold State, New Hampshire, and Mr. Towne, chairman of the free silver Republican party, have also lately spoken to the same effect. I must add that, while the open mints of the United States and India would be sufficient for maintaining such a ratio, I would much like to see France included in any agreement, and I believe that, if this country showed itself ready to reopen the Indian mints, the co-operation of France could also be secured.

11,653. I should like to make this quite plain. I listened carefully to what you read, but I did not see any proposal there for a ratio to be arranged between India and the United States alone without the assistance of other powers. I think that was the particular question you were asked—whether you had reason to believe that, without the assistance of any other nation, India and America could raise the ratio up to 1*s.* 4*d.* I do not gather that any of the authorities that you have quoted contemplate a ratio to be established in that way?—No, they were statements simply, but I give you my opinion that it can be done. I will give the grounds if you wish it.

11,654. (*Mr. Campbell.*) Without the co-operation of France, how could you establish the fixed par relation that you spoke of between the silver money of India and European countries?—By the general level. The point I want to make to you is this: that, when silver was maintained at a level under the old arrangements, the main thing (as declared by the Gold and Silver Commission) was that it was the power of the Latin Union, from its population and its trade, that kept the rate steady. Now the population of the United States would almost equal that; so that America acting alone, I believe, could do it; but I believe that it is very likely that America would like France to join, and I believe that France would not be unwilling to take part as well.

11,655. Without some arrangement of that kind, the European countries would have a right to send silver to India or America in any quantities they chose at the price you speak of, but they would not be obliged to take an ounce in return?—Of course; at least not at their mints.

11,656. Not even the French mints?—Not if they did not come in.

11,657. (*Sir J. Muir.*) These questions I am putting to you on behalf of Mr. Holland, who cannot be here to-day. You object to any interference by Government with the natural course of exchange. Perhaps you would make it a little more clear what you mean?—On behalf of the Manchester Chamber of Commerce, I desire to protest in the strongest possible manner against any such thing as a Government-managed currency or exchange. I need say nothing to impress this Committee with the commercial importance of the district of which Manchester is the centre, and I am sure I am representing its unanimous voice in its protest. To give the Committee an idea of the importance of Lancashire trade with India, I hand in some figures showing that Lancashire's exports are 71 per cent. of total British and Irish exports to India.

11,658. (*Sir F. Mowatt.*) Did you say Lancashire or Manchester?—Lancashire—Manchester being the centre of the manufacturing and exporting trades. The table is this:—

EXPORTS OF BRITISH PRODUCTIONS TO INDIA.

Lancashire District.

Estimate.

	£
Cotton yarns and goods - -	17,000,000
Machinery and steam engines -	1,700,000
Iron, steel, and other metals - -	800,000
Other manufactures, &c. (clothing, railway carriages, chemicals, glass, woollen goods, umbrellas, &c.) -	400,000
	£19,900,000

In these figures it is assumed that all cotton yarns and goods, except hosiery, belong to the "Lancashire District," including exports viâ Glasgow. The other items are estimated proportions of the total exports of each class to India from the United Kingdom.

Mr. R. Barclay.

12 Jan. 1899.

SHARE of TOTAL EXPORTS of BRITISH PRODUCTIONS sent to INDIA in the Five Years 1893–97 inclusive.

	1893.	1894.	1895.	1896.	1897.
	£	£	£	£	£
Total exports of British productions -	218,259,718	216,005,637	226,128,246	240,145,557	234,219,708
Of which to India - - -	28,814,880	29,339,781	24,753,008	30,097,768	27,382,091
Proportion to India per cent. - -	13·2	13·6	10·9	12·5	11·7

SHARE of TOTAL EXPORTS of BRITISH PRODUCTIONS sent to INDIA in the Five Years 1888–92 inclusive.

	1888.	1889.	1890.	1891.	1892.
	£	£	£	£	£
Total exports of British productions - -	234,534,912	248,935,195	263,530,585	247,235,150	227,077,053
Of which to India - - -	32,614,565	31,047,892	33,641,001	31,177,968	27,902,572
Proportion to India per cent. - -	13·8	12·4	12·8	12·4	12·2

The ordinary difficulties of trading are great enough, without such an element being introduced into it by Government; and the commercial community at large looks to the British Government to prevent the Indian Government, or any other Department of State which it controls, following any such course as Government interfering with the natural movements of exchange.

11,659. (*Sir J. Muir.*) Have you formed any general estimate of what the silver money in India amounts to?—I have already given my opinion that these things cannot be estimated accurately. I say "no," in reply to that question. But, apart from the coined rupees in circulation, I believe (considering the enormous imports of silver into India for centuries) that the amount of uncoined silver hoarded is much greater than any of the official estimates. Private advices I have had from India have brought this opinion from prominent native bankers of wide experience, who have given the subject careful consideration. They say that the estimate of Rx. 300,000,000 of uncoined silver hoards represents no more than the savings of the last 150 years under British rule; and that the total amount is probably nearer Rx. 1,000,000,000.

11,660. You speak of the native dissatisfaction with the effect of the closing of the mints. Have you any evidence of such dissatisfaction?—I have had it in the strongest terms in private letters from friends in India, who are well situated to judge of native opinion. Besides, leading Native papers, such as the "Amrita Bazar Patrika" (Calcutta), have given voice to such dissatisfaction; and, as Mr. O'Conor and other witnesses have thrown doubts upon the existence of any dissatisfaction, I must ask to be allowed to read extracts from leading articles which appeared in the "Amrita Bazar Patrika" of September 15 and September 19 last. As the Committee knows, this paper is printed in English. This is from a leading article in the "Amrita Bazar Patrika," of the 15th September 1898:—"When Mr. Arthur was asked by the President "of the Currency Commission whether there have been "'any decided expressions within your knowledge of "'native feeling on the present policy,' he answered, "'So far as the Native Press is concerned, I do not "'think there has been any feeling at all. When the "'Native Press in India has a grievance, everybody "'hears about it; but with regard to this question, I "'do not think I have seen a single native paper take "'it up and complain about it.' Of course, what "Mr. Arthur says is not correct. We have every "now and then written on the subject, and expressed "our entire disapproval of the currency measure. It "is strange that Mr. Arthur should venture to make "this bold statement, for, as President of the Chamber "of Commerce, he ought to have come across what "has been stated in this journal on that subject "several times. But, suppose that our articles did not "meet his eyes, he had yet no right to say that the "question had evoked no feeling among the Indians. "So early as July 1893, when the mints were just "closed, the Indian Relief Society submitted a petition "to Parliament, through the Right Honourable Mr. "Chaplin, which represented the Indian views and "sentiments on the subject. The petition created "some stir in England, as it was noticed by the "'Times' and other English papers." Then it goes on in another portion of the same article:—"The "whole question, from the Indian point of view, is "contained in a nutshell. It was established upon "the most reliable testimony that the amount of "uncoined silver in the hands of the native popula-"tion before the closing of the mints represented "130,000,000*l.* And now, by a single stroke of the "pen, by the arbitrary action of the Government, "the whole of this enormous amount of property "has become depreciated to an extent of which "neither the rulers nor the people of the country have "the slightest idea."

11,661. (*Sir F. Mowatt.*) I do not gather that, up to the time of Mr. Arthur's evidence, they allege more than that they themselves have on several occasions drawn attention to the subject?—Yes. Of course, this question is a new question to the natives; we must bear that in mind. As I have stated in the early part of my evidence, the actual effect of the closing of the mints was not at once realised by the natives; it took a long time. They went on for years melting rupees, and even in some remote districts do so still, I have been told.

11,662. Mr. Arthur's evidence, I must remind you, was not given before June 1898?—This was written after the receipt of the first Blue Book published by this Committee.

11,663. (*Sir J. Muir.*) This man could not write until he had seen the Blue Book?—Just so. I will not trouble the Committee with much of this, but I should like to read this extract from an article in the same paper, of the 19th September, 1898, headed, "How the Currency Measure has added to "the Poverty of the Indians." "It is impossible to "overstate the disastrous effect of the currency "measure upon the vast masses of this country. "In order to understand the real situation, it is "necessary to realise the appalling poverty to which "they had already been reduced before the closing "of the mints." Then, later on, it says: "The "point is not whether they take ornaments to the "mints to be coined or not, but whether or not

" the value of the silver in their possession—their " only property — has been nearly halved by the " arbitrary action of the Government. As there is no " question about this matter, so what our enlightened " Government should do, in righting this great " wrong, is to purchase all the silver from the people, " at prices which prevailed before the closing of the " mints, and pay them in gold. This is the only " alternative left to the Government to neutralise the " effects of a measure which, when properly realised, " will create the greatest possible distress and " discontent amongst the masses of India. It was " during times of famine, as a rule, that the Indian " peasant parted with his silver property. By " pledging, say, 10 tolas, he used to get, say, eight " rupees. But the Mahajan (the money-lender) at " the present prices of silver will give him only Rs. 5 " for 10 tolas. By the currency measure, therefore, " several times more poverty has been added to the " appalling one in which the ryot has already been " sunk. The position is all the more grave when it " is considered that the famine in this country had " always been rather of money than of food. When " the last famine occurred, the Viceroy telegraphed " that money was wanted, not grain, of which there " was sufficient in the country as a whole; and it is " an enormous loss of money that the people are " going to suffer from the closing of the mints. How " many deaths were caused by the great famine of the " last year will probably be never known; but it is a " significant fact that, while it raged, a pound of rice " in India was cheaper than a pound of wheat in " London. As the rupee is getting scarce day by " day, people have to purchase it at a higher cost than " before. This means that they have to part with a " larger quantity of their produce for a rupee than " before. But the Government wants its demands " in rupees. Since the Government has by its action " made the rupee scarce, the Government ought now, " to be just, to take its dues in kind. So the closing " of the mints has not only depreciated the property " of the ryots, but reduced their earnings, or rather " increased the Government demands upon them."

11,664. (*Sir F. Mowatt.*) I think you said the price when the mints were closed was at 1*s.* 4*d.*?—Yes, that is speaking generally.

(*Sir J. Muir.*) I understood we discovered yesterday that on the day the mint was closed the rate was at 1*s.* 2$\frac{5}{8}$*d.*

11,665. (*Sir F. Mowatt.*) Quite so. But I think the witness will agree with me that he put it at 1*s.* 4*d.*?—I was speaking generally of the effect of the closing of the mints upon the natives. As to the rate of exchange with London, I mentioned that was about 1*s.* 3*d.* on June 2, 1893.

11,666. (*Mr. Campbell.*) That is not a question of exchange at all. It is merely a question of getting 106 rupees for 100 tolas of silver, as they did before the mints were closed?—My object in putting this evidence before you is to contradict the statement that has been made that there is no feeling among the natives. I should like the whole of these articles to appear somewhere in the proceedings of your Committee, but that is a question you can decide afterwards. I think it ought to go in somewhere, because that statement of Mr. Arthur's and those of other witnesses have gone forth, and I think the natives in India will not be satisfied unless it is recognised that there has been, and in the very nature of things there must be, a strong feeling upon this matter. Had the same thing occurred in England, it would have been a great hardship, and the English people would have cried out against it. I may also say that a few days ago I received a telegram addressed to me at Manchester, signed by the President of the Indian National Congress meeting at Madras, saying the Congress had passed a resolution protesting against a gold standard for India. I may say I do not know the President of the Congress, nor have my correspondents in India any connexion with it. I assume the telegram was addressed to me as President of the Manchester Chamber of Commerce, as it is well known in India that our Chamber is opposed to the gold standard, and in favour of reopening the mints to silver.

11,667. (*Sir J. Muir.*) Are you aware that some of the Native States have recently given up the right of coinage?—I am, but the public do not know all the circumstances attending the abrogation of their rights by these native princes.

11,668. Perhaps you would not mind stating the names of the Native States?—I will do so as far as I can. "We know that the princes are very jealous of their sovereign rights, and I know from my private advices that the rights of mintage are regarded very jealously by some of them. There is one fact in this connexion to which I would like to draw attention. I believe Kashmir is one of those States which have given up rights of coinage. Now the Maharajah of Kashmir is a minor and his guardian is a British officer. To a Committee which includes high Indian officials, I need say no more to explain why Kashmir has given up its rights.

11,669. (*Sir F. Mowatt.*) If Kashmir has given it up on that ground, it is not apparently that the native rulers desire to give it up?—There is no native ruler at all—he is a minor.

11,670. You do not quote that as an evidence of a Native State having given up its right to coinage because it was dissatisfied with it?—No.

11,671. (*Sir J. Muir.*) Do I understand you to mean that the ruler is a minor, and that he has given it up under the advice of the British Resident?—Yes, under the advice of the British Resident, who is the real ruler.

11,672. (*Sir C. Crosthwaite.*) I understand you to say that the Maharajah of Kashmir is a minor, and that during his minority he has given up his right of coinage?—Yes.

11,673. Can you tell me when he gave up that right?—I cannot.

11,674 Are you certain that he is a minor?—I have an authority for saying so. I have every reason to believe that the person who gave me that information is correct.

(*Sir C. Crosthwaite.*) I believe I am right in saying that he gave up the right last year, and that he is not a minor; in fact, he is a man of mature age. He was for a time under a kind of tutelage, but during that time, which is past, he did not give up his right of coinage. Some time back he was restored to his full sovereignty, and he now governs the country with the aid of a council; and I think I am right in stating that it was last year he gave up the right of coinage.

11,675. (*Sir F. Mowatt.*) I am sure, Mr. Barclay, you will feel that that illustrates the immense importance of testing the value of information derived from correspondents?—It is very difficult to get information. Of course, Sir Charles is an authority, and all the exact circumstances are better known to him than to me.

11,676. (*Sir C. Crosthwaite.*) But, when you make these statements, have you examined the official papers or taken pains to ascertain the exact facts?—No, I have not in this case, but I have been very careful with nearly every part of my evidence. I have spent days over it.

11,677. When you say that the Maharajah of Kashmir was a minor, and that he was made during his minority to give up the right of coinage, have you taken the pains to go to official sources to ascertain the facts?—Personally I have not.

11,678. (*Sir J. Muir.*) Is there any other State besides Kashmir that you can mention?—Well, I have no other information except on the same grounds. There was a small State that also gave up the right.

11,679. Which was that?—I do not think I ought to give it; if you wish it, I will do so. I was referring to Bhopal. I reserve to myself the right of sending in some explanation with regard to that last answer that I gave. I have had correspondence referring to

Mr. R. Barclay.

12 Jan. 1899.

this matter for some time, and that point has come out very fully—I mean the jealousy of the Native States for that right.

11,680. (*Sir C. Crosthwaite.*) But if you say that any pressure has been put upon them to give up this right—— ?—I quite realise the importance of your question.*

11,681. Have you heard of Bhopal giving it up? —Yes.

11,682. Do you know that the Begum of Bhopal did it of her own accord?—I am told it is a very small State.

11,683. It is a small State, but a very important State. Bhopal is one of the best of our feudatory States, and the Begum did it of her own accord, because I suppose she saw it to be to her advantage to have her coinage put on the same level as ours. Have you ever heard of any other Native State doing it?—No, I know of no other Native State. I may mention that the articles which I have quoted bring out the fact that this is a new question in India that the natives are only now exercising their brains upon, and that they do not realise it altogether. I have no doubt that all of these are very loyal States, and that they would do as much as they could to come into harmony with the English rule.

11,684. But I do not think they would do what is not to their own advantage?—Quite so. I may say that, when I wrote this out, I had no intention of personally reflecting on the Government at all. They would, of course, do what they thought the right thing.

11,685. (*Sir J. Muir.*) You urge that India should abandon all idea of a gold standard. Is it not a fact that various countries, even in recent years, have adopted a gold standard?—It is a fact; and the results ought to have taught the Indian Government a lesson. I trust, indeed I am confident, that the consequences will be fully taken into account by this Committee, for the facts stand thus: The countries which in recent years have gone on a gold standard are Russia, Austria, Japan, Chili, and Peru. Their present positions are as follows:—Though Russia has accumulated upwards of 130,000,000*l.* in gold, this sum is apparently considered inadequate by her responsible financial advisers, for a high price continues to be paid in the market for gold for export to Russia. A few days ago, the London "Standard" said: "It is certain, at any rate, that M. de Witte's "position is a little shaken at present, owing to the "apparent impossibility of keeping up the compulsory "rate of rouble notes, in consequence of the poorness "of this year's harvest in Russia, and some of his "most zealous supporters are about to desert him." The Russian Agricultural Congress last year petitioned Government to give up the gold standard. As to Austria, though she has acquired 40,000,000*l.* in gold, the Government is keeping it locked up and out of free circulation, and gold continues at a premium. That is the position in Austria. She has never effectively brought this gold standard into operation. She has no gold currency; gold is at a premium to-day. Then, as to Japan, the Government are using all possible pretexts to avoid exchanging the silver yen into gold. The slightest scratch on the face of a yen is sufficient to cause it to be condemned as "defaced" and, therefore, inconvertible. The authorities have also in a most unjust manner recently altered their original decree by reducing the time given for presentation of silver yens for conversion into gold. Of the gold acquired for the conversion, such a large amount has already been exported from Japan, that the Government are replenishing their stock by having a portion of the last instalment of the Chinese indemnity shipped from England. But, while this "official gold stream" is flowing from England to Japan, the stream of gold from Japan still flows in shipments to Europe and America on account of banks and financial and commercial houses. Recently, an agitation has sprung up amongst the manufacturers and exporters of Japan for a bounty on Japanese exports. I may say that Japan started with 10,000,000*l.* of gold, and has replenished several times since. Then, as to Chili, the gold standard has practically broken down. A moratorium has been decreed, the printing press is to be utilised; a Bill authorising the issue of 50,000,000 paper dollars having been passed by the Chamber, and the premium on gold has reappeared, so that Chili's gold standard exists only in name. The Press unanimously attributes Chili's grave financial situation to her efforts to be "on gold." I am informed (this is information I got yesterday) on most reliable authority that a Committee appointed by the Chilian Government is now sitting to advise as to the steps to be taken to revert to a silver standard. Then, in Peru, the gold standard, which was somewhat "shadowy" from the first, now only exists in name. Those are the countries I refer to.

11,686. You consider that, while the mints of India remain closed to silver, India will be at an industrial disadvantage compared with China. Do you wish to say anything in support of that view?—Those who trade with countries where exchange questions arise, know that a relatively low exchange favours the internal industries in competition with rival producers and shippers. China has a great advantage now. The value of a piece of silver in China of the weight of a rupee is under 10*d.* as against 1*s.* 4*d.*, the token value in gold of a rupee in India, and, if the Government scheme were adopted, the value of silver would fall still further. Such conditions in China and other silver-using countries would tell against industrial India. I would draw attention to the following extract from a Consular Report, which, of course, I can refer to in exact detail. This is a Straits Report for 1897. These Consular Reports of China and the Straits are full of this question. This one says:—"The success of the experiment of "closing the mints in India has favoured exports "to that country while diminishing exports there- "from to places with a silver standard." I have not only that Consular Report, but I can give several showing that the effects are very great.

11,687. (*Sir C. Crosthwaite.*) Was that extract that you read with reference to the rice trade?—I think it is with reference to the general trade. The full paragraph is this: "From British India and Burma "there was a decrease in imports of over 4 million "dollars owing to smaller supplies being received of "rice and opium, but exports thither increased by "3½ millions. Larger exports of raw silk, areca nuts, "and fish, account for this. A large quantity of rice "also was exported to British India, amounting in "value to 1¾ million dollars over and above the value "exported in 1896. The success of the experiment "of closing the mints in India has favoured exports "to that country while diminishing exports therefrom "to places with a silver standard."

11,688. (*Sir J. Muir.*) Are there any other advantages which you claim for the reopening of the mints to silver?—There is one other advantage I have not touched upon. I believe it would tend to stop the illicit coinage of silver in India. The present conditions offer a great temptation to natives to illicitly coin full weight silver rupees of standard fineness, for they could make a handsome profit by it, and this, which might seem to them but a slight offence, would probably lead them further to make coins with less silver in them. I believe the present system has led to increased illicit coining. I am aware that Mr. O'Conor stated in his evidence he was not aware of any increase, but the Indian Mint Report for 1897, which Mr. O'Conor has doubtless since seen, states

* *Note by the Witness.*—I have referred to my correspondence and find that the expression with regard to the Maharajah of Kashmir is that he is "under tutelage." From this I naturally inferred that he was a minor under guardianship. I accept, of course, Sir Charles Crosthwaite's statement that the legal state of tutelage has ended, but the information sent to me is to the effect that the tutelage is really still existent, and that the Maharajah's renunciation of his rights of coinage was not voluntary

that there were increases in that year over the previous year in offences against the Mint Laws of 26 per cent. in persons brought to trial, and 45 per cent. convicted. Then in my correspondence I have had frequent references made to the thing as a fact, especially in the Native States, and also that the Zenana system of India lends itself to it a great deal. Of course, the biggest risk to the Government is upon the mintage of a perfect coin. There need be no deterioration at all to give profit. And, again, they are said to have dies from Europe.

11,689. (*Sir F. Mowatt.*) When you say dies, do you include machinery?—Machinery also.

11,690. Do you know by whom that is said?—Yes, but it is private, and I cannot give it.

11,691. (*Sir C. Crosthwaite.*) Has there been any proof of it? Has any machinery been taken?—I do not know. I cannot go further than mentioning the fact that I have have had correspondence in the matter. You must take it for what it is worth.

11,692. You cannot work milling machinery without considerable noise? — Oh, yes, it is all quiet; and, of course, there are many operations which can be carried on subsidiary to that of milling, and which would make a cloak for the milling operations. One person suggested the continuing of a shaft through a Zenana wall.

11,693. Did your correspondent give you any specific instances?—He has given me a great many cases where laws attempting to prevent the importation of things have been evaded, especially in the matter of arms. I may say that this came out in reference to Sir John Lubbock's proposal of a seignorage—that it would lead to the evasion of the law.

11,694. (*Sir F. Mowatt.*) I think I must remind you that the question put to you was whether your informant, whose name you are unable to give us, (and not unnaturally), supplied you with any specific instances within his knowledge of machinery being in the possession of coiners?—He referred to this very specifically.

11,695. But did he give you an instance?—No. Of course, the difficulty of these things is very great.

11,696. I only want the fact. Did this correspondent—whose good faith I do not for a moment question, and I do not question at all the propriety of your quoting what he says—give you any specific instance of machinery being in the possession of native coiners?—He declared that it was being done. He gave me the details of the way in which the thing was worked.

11,697. The details of a particular instance?—Of course it would be.

11,698. (*Sir C. Crosthwaite.*) Which had been detected?—That I cannot say.

11,699. (*Sir J. Muir.*) Do you consider that a combination between the United States and India might be relied upon to give a steady exchange of 1*s.* 4*d.* for India?—Certainly. As I have stated, before the closing of the Indian mints silver never fell below 38*d.* per ounce, and, besides consumption in the arts and general demand, the chief supports it had were the open mints of India and a purchase by the United States Government of a limited quantity per annum under the Sherman Act (54,000,000 ounces per annum). Under the plan now proposed, practically all the other demands for silver would continue, the Indian mints would again be reopened, and the open mints of the United States would constitute an active and potential demand for an unlimited quantity.

11,700. Assuming the alleged stringency of last year to have been a fact, in what way would the Government scheme aggravate the stringency?—The Government scheme includes the melting of silver rupees. As silver rupees are necessary to move the crops, the reduction in the volume of silver rupees would entail extra stringency. It might be alleged that, under the Government scheme, gold would provide every requirement for India, but, even if the Government provided gold or attracted gold—which I consider doubtful—that metal would not take the place of rupees. This is a memorandum drawn up by a gentleman you, Sir John Muir, know very well, who was many years in India, and I discussed the thing very fully before coming here, and he sent me a note referring to it. It shows that the place which gold might have been expected to fill is already fully occupied. This is what he says——

11,701. (*Sir F. Mowatt.*) If you will put it in as your own evidence, we will take it?—I will do so. This is showing the internal working of trade in India. "Payments by one trading centre to another "are made in native shroffs' hoondies, or drafts, "often the draft of a shroff in one place, as Calcutta, "on his firm or agent, as the case may be, in another, "as, say, Lahore, and these drafts or cheques are "passed with endorsement from one to another— "frequently through many hands before being finally "presented for payment. The only other means of "discharging internal debts at a distance, otherwise "than in coin, is through the Government Treasury "or the Presidency banks and their agents, which "are, of course, only to be found in the chief centres, "at great distances apart. Without this system of "native banking—which has, no doubt, been in operation for centuries—it would have been impossible, "with either gold or silver coin, for trade to a tithe "of the extent of the actual movements to have been "carried on. In times of war, famine, or other disturbing "causes, payments for produce even in the Presidency "cities have had to be made in silver coin at scale, "as the produce or merchandise was weighed out, and "throughout India generally it is doubtful if any but "men of wealth and standing are accustomed to pay "or receive payment in other than coined rupees. "The Burmese trade, when we first annexed Rangoon, "was only carried out by payment in coined rupees "for the rice, &c. as weighed and delivered, and to "this day the Rangoon exports are paid for by the "annual large shipments of rupees in November and "December from India or elsewhere. It is this "annual movement that, it is said, has caused the "present rise of 1 per cent. in the Bank of Bengal "rate. While India, therefore, has had for centuries "an established system of internal exchange, not "dissimilar to our own, it has had to be accompanied "with a large floating currency in silver coin to "finance the constantly recurring harvest, which "currency must be annually added to, to meet the "requirements of the rapidly increasing population. "For large payments, India has always had suitable "internal exchange arrangements, and it is for the "immense aggregate of small payments that silver, "and only silver, is required."

11,702. Do I understand, from the memorandum that you have read, that you consider that only a tithe of the larger financial transactions in the internal trade of India is carried on by silver?—The movements of capital into the centre are by the native bankers, and are in silver. Besides the movements of silver, there is a movement of capital between the centres which is settled by these shroffs' notes.

11,703. Then a very large proportion of the larger transactions are carried on by the shroffs' drafts?—Yes.

11,704. Now, let me refer you to a paragraph of your original statement, in which you say, "In the "vast internal trade of India, which is of infinitely "greater extent, they are almost, if not altogether, "absent; money, in the primary form of coin of "intrinsic value, serving all the purpose of trade, both "as medium of exchange and standard of value." Is that consistent with saying that nine-tenths of the larger transactions of the internal trade in India are carried on by these shroffs' notes?—It is the movement of capital into the centres, where it is dispersed, that I was referring to.

11,705. That is your explanation?—Yes. I think I have enumerated all the points to which I wish to call attention; but I would add that no other remedy

Mr. R. Barclay.

12 Jan. 1899.

which has been placed before the Committee, besides that which I urge, meets all the requirements of the natives, all the requirements of the importers and exporters trading with India, and also all the requirements of the Government. This plan was put before the Committee by Sir Forbes Adam, who does not belong to the monetary party with which I am identified; but, as I have stated, I strongly recommend its adoption, and, so far as I have had an opportunity of judging, I believe it has the cordial support of all parties in Manchester. The adoption of the plan of settlement which I recommend would give India the great benefit of a par of exchange with both gold and silver using countries—a benefit which no other remedy would give. And I may add that the operation of the plan would secure for this country also the benefits of a par with gold and silver using countries. I may also say that, whereas under any gold standard scheme the money of the people of India must be dishonest coins, the plan I recommend would once more give the people honest money.

11,706. (*Sir C. Crosthwaite.*) I would like to understand your exact position. You say you would reopen the mints under certain conditions, namely, that an international agreement was arrived at by which silver was fixed at 1*s.* 4*d.*?—Yes.

11,707. Am I right in supposing that, if that international agreement was not arrived at, you would not reopen the mints?—Well, there are some witnesses who would go the length of saying that they would. I propose it with the view of having concurrent mintage with other countries.

11,708. But, suppose we cannot get that, are we to reopen the mints at all risks?—There is no necessity for risks. In this I am speaking for the Chamber.

11,709. What do the Chamber say?—The Chamber say, they would wait for suitable conditions.

11,710. Then we should have to wait, as at present, an indefinite time, until these suitable conditions can be obtained?—Yes; but I believe, if this Committee favour a plan of this kind, these suitable conditions would very soon evolve themselves.

11,711. (*Sir F. Mowatt.*) The essential condition, as I understand, being the maintenance of 1*s.* 4*d.*?—Yes.

11,712. (*Sir C. Crosthwaite.*) Do you think that, if those suitable conditions were obtained, there would be a gold currency in India?—I think it would simply go back to the old silver currency.

11,713. And the rupee would be at 1*s.* 4*d.*?—At 1*s.* 4*d.*

11,714. What would be the difference between that and the proposal to fix the rate at 1*s.* 4*d.* by adopting the gold standard?—As regards India, you mean?

11,715. Yes, as regards India?—It would bring up China to the level of India; they would be in the same position with all silver countries.

11,716. Is there any other advantage to India in it?—It would be also in a definitely fixed position, without the risk of management, and it would be automatic.

11,717. If the gold standard were effectively established, that latter advantage would be obtained, would it not?—But I hold that, doing it in the way you are doing it, you have no certainty in continuing it.

11,718. We are not doing anything: you mean, if a gold standard were established in the way the Government of India has proposed?—Yes, if it were successful, but I hold that you would not gain confidence. I bring out that point very fully—you would not gain confidence, because it would be a managed currency.

11,719. Besides that, you object to having a gold currency?—Yes, because I think it is impossible. I may give an instance from my own experience in India. In the year 1895, when I was in India, travelling with my party from Agra to Jeypore, I happened to run short of small money. We had some refreshments at a station on the way, and our bill came to seven or eight rupees. I tendered the native servant a gold sovereign, but he would not look at it. Then the manager was brought on the scene, and he said he could only give 10 rupees, the rate at the time being 18 rupees in Calcutta. That shows the disinclination of the people to use gold in small affairs.

11,720. Gold is not legal tender there?—No. That was, of course, practically near the centre.

11,721. With regard to the extracts that you read from native papers, I wanted to ask you whether you have read those as mere extracts, or do you back them?—Not at all. I simply put them in to show that there is a very strong feeling among the natives of India against a gold standard.

11,722. As regards the assertion that the Government of India is depriving a vast mass of the natives of India of their wealth, do you back that assertion, or not?—I say positively, it does. My object in putting in those extracts was this: It has been asserted that there is no movement or feeling among the natives of India in regard to this matter.

11,723. (*Chairman.*) Asserted by whom?—By Mr. Arthur and Mr. O'Conor, as I have already stated. This is an article rebutting that, and pointing out that that paper itself had often commented upon that subject before.

11,724. (*Sir C. Crosthwaite.*) As regards the expression of native opinion, I should like to read an extract from a memorandum by Joy Gobind Law, Member of the Viceroy's Legislative Council. He says: "Much has been made of the losses which the poorer "classes of the people have been put to, because of "the appreciation of the rupee, in connexion with the "silver ornaments they were possessed of before 1893, "but I have never heard of any serious or widespread "complaints on this head, and, whatever their losses "may have been at the commencement, it is undeniable "they were not in operation since; and as they, the "people, have been during the last few years in a "position to secure a greater quantity of silver bullion "for a given number of rupees than they ever were "before, no doubt this has been a source of pleasure "and enjoyment to them." Now you wrote a book, I think, on the "Disturbance of the Standard of "Value" in 1896?—Yes.

11,725. I do not want for a moment to try and convict you of inconsistency, but I want to ask you if you still hold this view. On page 132 you say: "If "the buying power of India's money internally were "to become less than formerly, through a much higher "ratio than 15½ to 1 being permanently established, "there would then be a palpable rise in the cost of "living to the poor native, who has always such a "narrow margin between what he earns and the "bare maintenance of his existence"?—Of course this silver question has been a growing question.

11,726. I want to know whether you hold that view still, or not?—Yes. I quite hold these views still.

11,727. Then we are in this dilemma, that, if we allow the rupee to depreciate, we are robbing the poor native; and, if we try to raise the value of the rupee, or to keep up the value of the rupee rather, (which is all the Government of India propose to do), then also we are robbing the poor native?—This was in view of different circumstances altogether.

11,728. But, as regards this question of the loss to the native community, which of these two views are we to take?—There are not two views. This is a different analysing of the question altogether, and from a different standpoint. I was in that book balancing the possibilities—what would be the effect of fixing a higher ratio than 15½ to 1; and I tried to demonstrate that the higher the ratio fixed, that is, the lower the gold value of the rupee was permanently fixed, it would be an injury to the natives, and I hold that view still. That is from the old point of view, you will remember, when silver and the rupee were one thing, and it is at a time when prices had not fallen in India at all; you must bear that in mind.

Mr. R. Barclay.
12 Jan. 1899.

11,729. (*Chairman.*) Do you say prices had not fallen in 1896?—They had not fallen to the figure they are now.

11,730. (*Sir C. Crosthwaite.*) Had prices risen?—This was published in 1893.

11,731. From the bi-metallic standpoint, the same facts seems to suggest opposite conclusions?—It is a very complex question, and various views may be taken of the circumstances in India. The mints are closed to silver, and there can be no bi-metallic comparison.

11,732. I do not desire to press you at all about it. Now, you attach great value to a stable exchange, do you not?—I do; very great value.

11,733. When you say that you would reopen the mints, are you prepared to throw over all the advantages which you think belong to a stable exchange?—By no means.

11,734. What do we get instead?—The question will be settled. This question has been going on for the last 20 years. The Bi-metallic League has never gone in for a particular ratio. There was a desire on the part of many, for many years, to go back to the old ratio, and it could have been done. Now, in concert with many friends who were formerly opposed to any arrangement with other countries, we are co-operating in this effort to secure such concurrent mintage in other countries on such a basis as will enable India to open her mints to silver and yet secure a stable rupee at the gold value which the Indian Government desires, and thus settle the question.

11,735. The former state of things, when the mint was open, you regard as injurious to the whole community—to the merchants, and to the people, and to the Government, and to the manufacturer?—Yes.

11,736. Could the manufacturer recover his loss at all, or guard himself?—At the beginning of the question. You must remember that the whole trade of India has changed under the conditions that this unsettled exchange has brought about.

11,737. I am dealing with the unsettled exchange. With the unsettled exchange, could the Manchester manufacturer protect himself, in the same way as the merchant could, by buying exchange forward?—No; the manufacturer could not protect himself against exchange variations in the market.

11,738. Then, why does the Manchester Chamber of Commerce now advocate open mints, and a return to that state of things?—A return to what state of things?

11,739. The Manchester Chamber of Commerce, I now understand, want the mints reopened?—Yes, with a stable exchange.

11,740. (*Chairman.*) With a ratio fixed?—With a ratio fixed.

11,741. Suppose no ratio is fixed, what do they want? I want really to know what the Manchester Chamber of Commerce wants?—We want open mints, and the way of getting open mints is to provide for the difficulty of the Indian Government.

11,742. I agree with all that; but I want to understand this. You say that the Manchester Chamber of Commerce is prepared to run all the risks of the mints being opened. Are we to take that as their opinion?—They do not say so.

11,743. But you said so in reply to Sir Charles Crosthwaite?—I said they would wait for suitable conditions. I personally suggested conditions.

11,744. I want to get from you exactly what the Manchester Chamber of Commerce meant?—I think it is not fair to put it in that way. I want the mints opened with an arrangement of concurrent mintage which will secure a steady exchange.

11,745. But suppose you cannot get that arrangement?—That is a further consideration.

11,446. Then the opinion of the Manchester Chamber of Commerce which you gave us yesterday in favour of reopening the mints depends on that reopening being accompanied with a fixed ratio?—They do not say that exactly.

11,747. But you say so?—Yes. That is the way it could be secured.

11,748. But, if it could not be secured, what then?—That is a matter for further consideration.

11,749–50. Is that the answer of the Manchester Chamber of Commerce to this Committee?

(*Sir F. Mowatt.*) I think Mr. Barclay has already told us this morning that he himself regards the maintenance at 1*s.* 4*d.* as an essential condition of the opening of the mints. The rupee must be maintained at 1*s.* 4*d.*?

(*Witness.*) Yes.

11,751. (*Chairman.*) And that must be done by statute—by law?—Yes, by enactment based on an international agreement.

11,752. (*Mr. Le Marchant.*) You alluded to the Argentine trade. I think you have had considerable experience in the Argentine trade?—Yes.

11,753. You referred to the circumstances in 1884. Now, do you consider that, when the Argentine paper dollar was falling in value, and prices were rising, the country was on a sound basis of prosperity?—No.

11,754. What is the present position? Has the dollar been increasing in sterling value?—Yes.

11,755. Do you think the country is at the same time concurrently reaching a sounder basis?—Yes.

11,756. What would you view as the essential conditions of that improvement?—Coming back more or less to the old value of the dollar. I may say, of course, when the currency is unsettled, a paper currency such as the Argentine currency, if it settles at a given point for a length of time, people are very well content to go on with it and they would not care for its either going up or going down; they begin to believe in that as the point; but then it is the great falls that derange prices, and that no doubt favours the exporter for a long time. Of course they do adjust themselves, but it takes a long time.

The Witness withdrew.

Professor ALFRED MARSHALL called and examined.

Prof. A. Marshall.
11 Jan. 1899.

11,757. (*Chairman.*) You are Professor of Political Economy in the University of Cambridge?—Yes.

11,758. What is the general nature of the evidence you are willing to give to this Committee?—In trying to make up my mind as to what currency arrangements are best for India, I have been specially hindered by my ignorance as to the nature and extent of the business relations between the country at large and the centres of European commerce in Calcutta and other large towns. But, on being informed that the scope of the Committee's enquiry extended beyond questions of practical administration, and raised some broad issues of economic principle, and that I might be excused from expressing opinions on questions that required much knowledge of India, and might confine my evidence to the general relations of currency and trade, I have ventured to accept the invitation with which the Committee have honoured me.

11,759. Then, in questioning you, we will confine ourselves to the limits which you yourself have laid down. I will ask you first, what do you consider to be the relation between the volume of currency and the general level of prices in a country?—I hold that prices vary directly with the volume of currency, if other things are equal; but other things are constantly changing. This so-called "quantity theory of the value of money" is true in just the same way as it

Prof. A. Marshall.

11 Jan. 1899.

is true that the day's temperature varies with the length of the day, other things being equal; but other things are seldom equal. This theory has been the cause of much controversy; but it has never been seriously denied by anyone who has taken it as a whole, and has not stopped short, omitting the words "other things being equal." The fact is that in every state of society there is some fraction of their income which people find it worth while to keep in the form of currency; it may be a fifth, or a tenth, or a twentieth. A large command of resources in the form of currency renders their business easy and smooth, and puts them at an advantage in bargaining; but, on the other hand, it locks up in a barren form resources that might yield an income of gratification if invested, say, in extra furniture; or a money income, if invested in extra machinery or cattle. In a primitive state of society, even in one as far advanced as that of India, only the rich care to have much of their resources in the form of currency. In England all but the very poor keep a good deal; the lower middle classes keep a relatively very large quantity; while the very rich who pay all their tradesmen by cheques use relatively little. But, whatever the state of society, there is a certain volume of their resources which people of different classes taken one with another care to keep in the form of currency; and, if everything else remains the same, then there is this direct relation between the volume of currency and the level of prices, that, if one is increased by 10 per cent., the other also will be increased by 10 per cent. Of course, the less the proportion of their resources which people care to keep in the form of currency, the lower will be the aggregate value of the currency, that is, the higher will prices be with a given volume of currency.

11,760. How may this relation between the volume of the currency and the general level of prices be permanently changed?—It may be changed permanently, first, by changes in population and wealth, which change the aggregate income; secondly, by the growth of credit agencies, which substitute other means of payment for currency; thirdly, by changes in the methods of transport, production, and business generally, which affect the number of hands through which commodities pass in the processes of making and dealing. These causes are specially difficult to trace in India. In some parts of India the local informal petty cash seems to have fallen much out of use, and in other ways the work of the recognised currency has been increased. On the other hand, the rapidity of circulation of currency has also been much increased, and there has been a somewhat extended use of notes.

11,761. How may the relation be temporarily modified?—Passing by the effects of fluctuations and commercial credit on prices, it seems specially important, with reference to the Indian currency problem, to note that the level of prices which a given volume of currency will sustain, is liable to be affected by any lack of trust and confidence in the currency itself.

11,762. Temporarily affected or permanently?—Both, I think. The lower is the credit of the currency, the lower will be the share of their resources which people care to keep in the form of currency; the more, therefore, the currency will be depreciated, and the higher prices will rise. Here I would like to separate what appears to be agreed amongst students from what is controversial matter. I think it is agreed that, if the credit of a currency falls, its value falls relatively to commodities, even when there is no change in its volume. I think it is agreed that the history of the assignats and the American currency during the time of the forced paper currency shows that. I think it is also agreed that there is something fiduciary in the value of gold and silver; that is, that part of their value depends upon the confidence with which people generally look forward to the maintenance and extension of the monetary demand for them. Of course, their value is, in the long run, controlled by cost of production; but that influence is remote, and new supplies are always small relatively to the existing stock. And so fluctuations of their value are mainly governed at any time by currency legislation, actual and prospective. No one thinks of gold as likely to be demonetised; but, if there did appear to be any real prospect of that, everyone would agree that its value would fall, since the sole demand for it then would come from the industrial arts; and everyone would admit the same to be true as regards silver. But whether, in fact, silver is at the present time in that condition is a controversial matter. My own opinion is that silver just at present, at the particular time at which we are, is not as good a metal to be used as currency as it was in earlier times; nor as good a metal as it may become again in later times, when the East—or, since we must include Africa and South America—when the non-Western world has got into the habit of using currency for the ordinary transactions of life, and has not got to the stage at which gold would be likely to be used very frequently.

11,763. What do you consider to be the true relations between currency, bank money, and real capital?—Currency and bank money are both forms of command over real capital. They are commonly called capital; but they are really command over capital, in my opinion.

11,764. You mean the power to obtain capital?—Yes. Currency, especially legal tender, is a direct command; other forms of credit paper and bank money are command one stage further removed. Bank money can go by telegraph, but real capital must pass through the hands of the Custom House Officers.

11,765. Is the interest on permanent investments governed mainly by the relation in which the stock of real capital stands to the demand for its service?—That is my opinion. Assuming for the moment that there is no question of any change in the volume of the currency, the interest on investments is governed by the relation between the supply of capital and the need for services of capital by borrowers—whether thriftless borrowers who desire to anticipate future incomes, or thrifty borrowers who desire to use it as a means of creating future income, and who purpose to turn it into implements, irrigation works, railways, &c. If real capital is scarce, those who need it must pay a high price for it, and, if that high price does not call forth an increased supply of real capital either from home resources, or by borrowing from abroad, the industries of the country must be capital-starved; and she will not be able to keep her place in the march of progress. But now, assuming the arts of production to remain stationary and that there is no change in the pressure of population on the means of subsistence, a rise in prices will enable the borrower to pay interest at less outlay and to pay back capital at less outlay than would otherwise be the case. It is important to lay stress upon there being no change in the efficiency of production, because this goes to the root of the controversy between those who think it would be right to keep the purchasing power of money constant relatively to commodities, and those who do not. The pith of the matter may be put by an illustration. A person who borrows a peck of green peas in April, and returns two pecks in June, has paid no interest at all, he has not even returned the corpus of the loan. This is, I think, beyond question; but the application of the principle contained in it to the equity and expediency of currency legislation is a matter of controversy. It seems to be clear arithmetically that, if a man borrows 100 rupees under contract to pay back 105 rupees at the end of the year, and if meanwhile the purchasing power of money has risen 10 per cent., he cannot get the 105 rupees which he has to pay back without selling one-tenth more commodities than would be sufficient for the purpose at the beginning of the year. Assuming, that is, that the things which he handles have not changed in value relatively to things in general, he must sell at the end of the year commodities which would have cost him 115 rupees 8 annas at the beginning, in order to pay back with interest, his loan of 100 rupees, and, therefore, he has

lost ground unless the commodities have increased under his hands 15½ per cent. While nominally paying 5 per cent. for the use of his money, he has really been paying 15½ per cent. On the other hand, if prices had risen so much that the purchasing power of money had fallen 10 per cent. during the year, and he could get 100 rupees for things which cost him 90 rupees at the beginning of the year, then, instead of paying 5 per cent. for the loan, he would really be paid 5½ per cent. for taking charge of the money. This illustrates the principle that the general rate of interest will be raised by a gradual and anticipated fall in the value of currency relatively to commodities, and that it will be lowered by a rise in that value, even where there is no change in the conditions of general demand and supply. The high rate of interest on permanent investments in India seems to be attributable partly to a relative scarcity of real capital, and partly to the continuous fall in the value of the rupee relatively to the currencies of the West. This matter has been long discussed, but latterly, within the last ten years, it has obtained increasing attention from economists. In particular, one of the ablest of the younger school of American economists, Mr. Fisher of Yale, has written a book on "Appreciation and Interest," which bears very closely upon this matter. If a diagram be made out, showing the average rate of market discount in London, it will be found, as a matter of fact, that the high rates do go with high prices. That is contrary to a good deal of what is assumed *à priori*, but I think it is really quite consistent with the theory when properly developed. I am not sure that it might not be worth while for the Committee to reproduce some of Mr. Fisher's tables which bear upon this subject. He takes the question of rupee paper only incidentally; but the table which he has worked out seems to show that the interest on rupee paper, reckoned at purchase price, is very little higher than that on the Indian gold loan before 1874; then it fell to about ·1 per cent., then it rose rapidly, with the distrust in silver, to ·7 per cent., and it has remained about that level to 1895, the end of Mr. Fisher's table, except during the years 1888 and 1889, when it was 1 per cent.

11,766. The rise of value, do you mean, or the interest?—The difference in the annual return to a person who invested 1,000*l.* in rupee paper, and a person who invested 1,000*l.* in the Indian gold loan, was ·1 per cent. in 1874, then it rose to ·7 per cent. and it has remained about that for the greater part of the time.

11,767. Any tables that you think would be desirable and would illustrate your own evidence, put them in at your pleasure in your evidence?—Here is Mr. Fisher's table. It is carefully obtained by averages from many entries, and with due allowance, in the case of repayable bonds, for the time they have to run to maturity.

RATES OF INTEREST REALIZED FROM DATES NAMED TO MATURITY OR IN PERPETUITY.

—	Silver.	Gold.	Difference.	Exchange on India. Pence per Rupee.

11,768. Now, what do you wish to say to us as to discount?—Other things being equal, interest for short loans will, of course, oscillate about the rate of interest to be obtained for permanent investments, allowance being made for the convenience, in some cases, to the lender of being able to recover quickly command over the capital which he has lent. But the rate of discount is specially sensitive to a casual stringency, and, in spite of the internationality of a certain class of bills, discount varies more locally than interest on permanent investments. Mr. Beckenridge, in the "Political Science Quarterly," for March, 1898, has compared the rates of discount in different parts of America, which, like India, is a continent; and he has shown that there is a steady rise in passing from the Eastern States to the Middle, thence to the Southern, thence to the Pacific, and thence to the Western.

11,769. Does a change in the volume of currency in a Western country alter the rate of discount temporarily or permanently?—The whole theory of discount is full of paradoxes, because the increase of prosperity sometimes raises discount, and sometimes lowers it. No interpretation can be given of a rise in discount, unless it is known to what cause the change is due. Speaking generally, discount will rise in consequence of a greater willingness of borrowers to borrow, or of a greater unwillingness of lenders to lend: the first generally indicates increased confidence, and perhaps increased prosperity; the latter generally indicates the opposite. Looking at the special case of the effect of an increase in currency on the rate of discount, the cycle in the West seems to be this. The new currency or the increase of currency goes, not to private persons, but to the banking centres; and, therefore, it increases the willingness of lenders to lend in the first instance, and lowers discount; but it afterwards raises prices, and, therefore, tends to increase discount. This latter movement is cumulative. The loans to one man make him a good customer for others at good prices, and make them therefore eager to borrow, and that makes them good customers; and so the movement grows. Thus, a fall in the purchasing power of money tends, after a while, to raise the rate of discount as well as the rate of interest on long investments. And, though the matter may be regarded by some as open to question, I myself go with those who hold that statistics bear out the *à priori* probability that, first, the rates of discount would generally be higher when prices are rising than when they are falling, because the borrowers would be eager for loans; and secondly, that they would generally be higher during periods of high prices, than in periods of low prices; not because one is the cause of the other, but because both are the results from the same cause—the prevalence of a confident spirit in the business world. Those periods are liable to be broken in upon by cyclones of distrust, and those cyclones raise discount for a time to the very highest levels of all. They are accompanied by

Prof. A. Marshall.

11 Jan. 1899.

falling prices, and a little later are followed by falling discounts. There does not seem to me to be any single and uniform relation statistically or *à priori* between the rate of discount and the rate of Exchange.

11,770. How far do you consider that Western experience in this matter is applicable to India?—I am afraid that my answer to this question must necessarily be rather long. The fact is that India, being governed by England, has necessarily had its affairs discussed largely by Englishmen, who are apt to take their opinions of what goes on in India very much at second hand. Sir Henry Maine gave countenance to the opinion that custom ruled the economic arrangements of India; and, in a certain sense, that is no doubt true, but I think that the doctrine requires to be analysed. There is no doubt that custom does rule the general tenor of life in India, but it does not, in my opinion, rule prices. The matter is one of greater importance than it looks. The common opinion of the world on Indian matters is formed largely on the basis of statements made by a few prominent English writers on currency, who have claimed to speak with special knowledge of India, and have been received as authoritative by foreign economists. I will quote from one writer. He is an able man, much travelled, and with great knowledge of affairs; and he has attained a position sufficient to cause him to be selected as one of three examiners for an important international prize relating to bi-metallism a few years ago. He says: "Prices have not fallen for the reason that gold is scarce——"

11,771. (*Sir F. Mowatt.*) Are you speaking of Indian prices for the moment?—No, he is referring to prices in England. He says:—"Prices have not fallen "for the reason that gold is 'scarce,' nor will they rise "because of an increased production of gold, if meanwhile the exchanges with silver-using Asia continue "to fall. The exchange value of any bushel of wheat "in Mark Lane has for 15 years past approximated, and "will approximate, an ounce of silver bullion; because "with open mints an ounce of silver bullion is $2\frac{1}{4}$ "rupees, and $2\frac{1}{4}$ rupees per bushel represents cost of "production and exportation from the Punjab wheat "fields. If the United States were to melt and sell "her silver currency, and if the Indian mints were re"opened, then, even if the production of gold sextupled, "the price of wheat would still fall with each "fresh fall in the gold price of the ounce of silver." I quote from a letter printed in the "Economist" of 15 September 1894. That doctrine, in a somewhat less extreme form, is the basis of many of the ablest and best known arguments in favour of the adoption of bi-metallism at such a ratio as would lead to a general rise of prices. When I was at Oxford 15 years ago, I had to study Indian prices; and I began a set of inquiries which have included the making of a very large number of diagrams, based chiefly upon Mr. O'Conor's figures. I have many of them here, but they would probably be too extensive to be printed. I would like to state, broadly, the results that I have deduced from them. I should say I have confirmed those results by many conversations with natives of India and with Englishmen who have been engaged in administering India. The results are, first, the chief purchases and sales in India are of grains, and the variations from year to year in the local prices of these in any one place are many times as great as in England. They are commonly 200 or 300 per cent., sometimes 400 per cent., in the course of one or two years. Secondly: They are greatest in those grains which are not affected by European trade. Here is one example. (*For diagram, see Appendix.*) That represents the movements of the annual price of jawar, which Mr. O'Conor tells me is the most important of all those food grains which are not exported to Europe, and on the prices of which, therefore, the so-called disturbing influence of gold does not operate.

(*Sir J. Muir.*) There seem to be enormous fluctuations there.

11,772. (*Chairman.*) The greatest variations, as I understand, are in grains which are unaffected by European trade?—Yes. I have a number of diagrams here which would support these propositions, if necessary. Thirdly: For any one grain they are generally the largest in those districts which are most remote from European influences. Fourthly: They are much diminishing under the influence of European trade. I have here a diagram which was published in the statement exhibiting the "Moral and Material Progress of India," for the years 1882–83. It is interesting in two ways. It shows that the variations in the prices of grains were very much greater earlier in the century than now; and that the average level of prices of grains has very much risen. I believe there is some doubt as to whether the details of measurement are all perfectly correct, but I think there can be no doubt as to the general truth of the picture which they present. Fifthly: As that figure shows, the purchasing power of silver in terms of grain has fallen throughout the centuries. Sir William Hunter says, that it was "two or three times greater" at the time of Akbar's land settlement than it is now; and it has fallen fast during the present century, the fall being broken only by periods of bad harvests. Sixthly: In consequence of a rapid change in the conditions of productions of cotton and iron, combined with a lessened cost of transport, the rupee price of the chief imports into Calcutta after 1873 fell faster than the average gold price of commodities in England. The assertion of some advocates of bi-metallism that the fall in the gold price of commodities in England was largely caused by the forcing down of prices by the Indian customers fits most ill with that fact. (*See diagram in Appendix.*) There has been a controversy as to whether Mr. Sauerbeck's index number does not exaggerate the fall in prices since 1873. Certainly there is no other important index number which shows so great a range. Neither that of the "Economist," nor the one which is generally followed abroad, Dr. Soetbeer's, shows so great a fall. But, to give the argument to which I am opposed every advantage, I have taken Mr. Sauerbeck's index number for average gold prices in England. That shows the fall in the rupee prices of the chief Indian imports at Calcutta down to 1886 to have been considerably greater than the fall of average English gold prices. After 1886 there is a rise in these rupee prices. Seventhly: The average prices of all goods in India since 1873 have been so disturbed by bad harvests, especially in 1877 to 1879, that their variations from year to year bear no resemblance to English prices. For this purpose, as Mr. O'Conor has not supplied us with a general index number, I have fallen back on that which was compiled by Mr. Atkinson from Mr. O'Conor's figures, and published in the "Statistical Society's Journal" for March 1897. That shows no relation to the English curves of yearly variations; but, on the whole, it is a curve of greater disquiet. If we look, on the other hand, at the broad movements of prices, it seems to be true that about 1885 a rise in normal rupee prices set in, by which I mean a rise not especially attributable to bad harvests. This is what the old-fashioned economic theory would have led us to suppose, because, when we watch the movements of the gold prices of silver and the gold prices of commodities in England, we find that the average level of gold prices of commodities was falling very fast until 1885, and the gold price of silver was not falling specially fast during that time—not so fast as afterwards. After that time the gold price of silver did fall somewhat faster, and the English gold prices did not fall fast; that is to say, the English silver prices rose fast. By English silver prices I mean the prices which would have to be paid in London for commodities in general if prices were reckoned in bar silver. Eighthly: The average price of Indian exports has kept fairly close to the general movements of English prices expressed in silver. If you draw two curves representing, (*a*) rupee prices of Indian exports in Calcutta, as

given by Mr. O'Conor, and (*b*) Mr. Sauerbeck's gold prices for England, divided by the gold price of silver, so as to represent the silver prices of commodities in general; you will see that, speaking broadly, the two curves do move together; the general relation between them is that which would have been anticipated by economists generally. Ninthly: The London prices of wheat and silver have seldom moved closely together; that is specially important with regard to the statement I recently quoted about an ounce of silver and a bushel of wheat. When they have done so, separate causes for these movements can generally be found. For instance, a spell of bad weather in July 1890 came about the same time as a change in the United States currency policy; these causes raised the prices of wheat and silver; and the subsequent fine weather lowered the prices a little while before the speculation in silver collapsed. And, indeed, when they have moved more or less together, it is as often as not the case that the movement in the price of wheat has gone before that of silver; and Mr. O'Conor has told you that the Calcutta price of wheat follows the London price. In evidence of this I will show diagrams representing the average prices of wheat and silver in London for each year of this century, and the prices for each week during the last twelve years. As to the interpretation of these facts, any suggestion that I make must be highly speculative. I fancy I see a different character in the curve prices for England and for India. I think that this difference corresponds to the fact that the production in England is chiefly—I will not say capitalistic, because that is a matter of secondary importance—but chiefly commercial, chiefly the production by people of things to sell to others. I should expect that, in contrasting a country of that kind with a country in which production is largely for domestic consumption, variations in prices would show themselves chiefly by sudden jumps up, in consequence of bad harvests, from a normal level; and I should expect that those variations in production which come, as they do in England, through the influence of changes in credit and the confidence of farmers that wheat was a paying crop, would be gradual and that you would get more rounded shapes in diagrams showing variations of annual prices. That is, I should suppose that you would get, in the case of a primitive country, a tolerably flat base with sharp peaks; and that in an advanced country you would get more nearly uniform waves. Jevons, in page xiv. of the Introduction to his "Investigations in Currency," still held something of the old doctrine which, as a young man, I used to hear in England, that you can never get prosperity in general business until you have a succession of good harvests. Jevons laid stress upon the fact that the stock of grain was so much the most important part of movable capital even in England, that it was to be expected that harvests should control the rate of discount and the activity of business generally. But wheat supply is less important now, and the Registrar-General has laid stress on the fact that the variations in the marriage rate no longer pay any attention to the price of corn. One would expect that curves representing movements of the price of corn in England early in the century would have shapes more corresponding to those for India now than those for England at the present time; and that appears to have been the case. I would venture also to throw out a suggestion of a very hazardous character. I have seen a great deal of evidence before various Commissions, this included, to the effect that the ryot knows nothing of what happens in Calcutta, that he knows nothing of Exchange, and that prices inland cannot be directly affected by anything that happens at tidal waters. It seems to me that it is possible that, though the ryot knows little or nothing of any disturbing causes coming across the sea; and although almost every important movement in price in any district in India is due to local causes; yet, the power of friction being great, when the influence of European trade comes upon the side on which the friction is working, then that influence may tell. And, seeing that the broad movements in upland prices (as distinguished from their annual oscillations) appear to conform more closely to the general relations of gold, silver, and commodities in world markets than I should have supposed beforehand; I am inclined to think that the cause may be this, that, when local circumstances have raised very much the price of any particular grains, then European influences may help friction and prevent them falling back as low as they otherwise would, and *vice versâ*.

11,773. Do you wish to say anything as to India being dependent on foreign capital?—I think the dependence of India upon foreign capital is a matter which must be taken into account in any practical legislation; and that one has to recollect that what governs the flow of capital from one country to another is not merely the relative strength of different economic forces, but the opinion that is held with regard to those economic forces by the people who have capital to invest. Now, those who are able to lend capital to India live exclusively in countries with a gold standard; and those people are apt to regard gold value as a fixed point, and to treat variations in the gold value of the rupee as equivalent to variations in its real value. In my opinion, this old common fallacy is not nearly so far away from the truth now as it was some time ago. The popular reasons for it, I think, are quite invalid; but, in fact, I believe that gold has been within the last 20 years, say, a good measure of value; though this is due solely to accidental causes—to the balancing of strong forces acting in opposite directions; and I see no reason for believing that that will continue. But this habit of thinking of gold value as a fixed point, whether right or wrong, does affect the willingness of investing nations to send their capital to India; and it makes them grasp, as recent events have shown, at an opportunity of getting back their capital on good terms in gold. This fact was one at least of the main arguments for the closure of the mints, and it is an even stronger argument against any vacillation in carrying through a steadfast policy. On the other hand, the very fact that the Government is bound under penalty of permanent injury to India, to fulfil any implicit pledges it may give, is a strong reason against the Government's giving even indirectly any pledges without having fully counted the cost and being thoroughly resolved to meet it. It would seem to me in the present emergency specially unwise to let the late exceptional stringency of discount in Calcutta hurry the Government into an increase of rupees. That would certainly impair the credit of the rupee.

11,774. You mean an increase in the issue of rupees?—Yes. That would impair the credit of the rupee, increase the export of capital, and would raise and not lower, the mean level of discount. On the other hand, the introduction of some elasticity into the circulation would raise the credit of the rupee, and would restrain any tendency of discount to rise to an injuriously high level.

11,775. How do you say that seasonal fluctuations can best be mitigated?—Stringencies and crises which arise from unexpected deficiencies of currency relatively to the demand for it are not to be avoided by a mere increase in the volume of the currency. They are just as likely to occur with a large stock of currency as with a small; indeed they may be caused by an inflation of currency leading to distrust, not only of currency, but of all other agents and instruments of credit. For instance, in 1893 it was not a scarcity of currency, but a belief that the currency had been unduly increased, and might be increased even more, which led to a crisis in the United States; 50 per cent. was the common rate of discount for a considerable time. We have heard much about the agony of 18 per cent. at Calcutta, but 50 per cent. was the common rate of discount in America for a considerable time; and, whilst currency was thus generally in discredit, other means of payment were disorganised, and in Chicago a large

Prof. A. Marshall.

11 Jan. 1899.

business was done in buying currency at a premium, the average rate being 100½. It is remarkable also, incidentally I may say, that the stringency of 1893 was almost entirely Western; while that of 1890 was almost entirely Eastern. That illustrates the fact that with all her 200,000 miles of railway America is not a country but a continent; and we must allow for the same difficulty in India, even though she has 20,000 miles of railways. But, although seasonal fluctuations are not amenable to control by a mere increase of currency, I believe they are amenable to control by arrangements which shall provide that there shall be a stock of currency which shall be used only in case of emergency. That currency may be, and I think should be, largely of paper; but the extent to which it may be of paper and the extent to which it must have a bullion backbone is, I think, not to be settled save for one country at a time; it must vary with changing conditions of time and place.

11,776. How far would the English practice be a good guide for India in this matter?—England is, in my opinion, but I speak with great diffidence, a specially bad example for India to follow in matters of currency. For, first, currency is but a small part of the means of payment used in England; and under most, though not all, conditions, bank money is the main means of payment; and that is elastic. Secondly, an imperative demand for increased currency is rare in England; and, when it does occur, it is on a very small scale relatively to England's total business and resources. The importation of the amount of 10 millions of sovereigns makes an enormous difference in Lombard Street, but it is a mere nothing relatively to England's total business. Whereas, if the same difficulty arises in a country in which the main payments have to be made with currency itself, you want an importation of currency, or an increase of currency, standing in some moderately high relation to the total business of the country; or, at all events, to that part of the total business of the country which is carried on on Western methods. Thirdly, England is near to other great gold markets. Fourthly, her financial houses are numerous and able. There are a vast number of able minds at work on her financial problems. Mr. Bagehot, than whom there is no higher authority on such a matter, says that there never was, since the world began, so high and massive a brain-power applied to any one question as is applied to these questions in England: and, so far as the mass of the ability goes, of course, India is not on a level with England. England's banking system is very highly organised, especially by the aid of the branch banks: it would take too long to develop that, but, I believe, the influence of the branch banks upon moderating stringency in England is greater than it appears, relatively to that of the rest of the banking system. Partly for this reason, currency drawn from London in the spring or autumn completes its circuit quickly; more quickly than in Germany; and, of course, much more quickly than in India. All these considerations seem to me to point to the necessity of working rather on the lines of the German Reichsbank than on the lines of the English Bank with regard to the regulation of the currency. I believe it is not generally known that the plan of the German Reichsbank of providing for increased issue in time of difficulty is not inconsistent with the principles of Sir Robert Peel himself. It came out in the evidence before the House of Commons Committee of 1848 (it did not come out at the time) that Sir Robert Peel had not supposed that his Act could be maintained under all circumstances; and had told Mr. Cotton, Governor of the Bank at the time, that it might be necessary for the Government to assume the responsibility of suspending it (Q. 4057); and Mr. Cotton, while holding that the Act should not be relaxed, says (Q. 4344–5) that the Act would be unnecessary "if the Bank "acted always on sound and well-defined principles"; and that these principles were already "better understood than they were in the year 1839" the events of which had, I think, much to do with Sir Robert Peel's decision not to leave the ultimate responsibility with the Bank. The Committee of 1857 had before it Lord Overstone's evidence that the principles of the 1844 Act had been much misunderstood, and that its framers realized that, though a contraction of the currency will check an external drain, "it will "not check or correct the demand for internal "purposes" (Vol. I., Q. 4239); and the Committee (Report, §§ 71–74), referring to Mr. Cotton's evidence in 1848, "advert to the question whether provision should "be made in advance for such contingencies [as those "of 1847 and 1857], and the conditions expressly laid "down on which the issue of an increased number of "Bank notes may in time of pressure be allowed"; and they "think that such a provision could not be "regarded as any violation of the principle of the "Act of 1844." The scheme at which they hint is conservative, and may be taken to have foreshadowed the German plan of enabling the Reichsbank to increase its issues to meet any emergency, whether due to the variations from one part of the year to another, or to a variation in one particular year of the general course of business. The elastic plan of allowing the Reichsbank to increase its own issues under certain conditions, the chief of which is that it should pay a tax to the Government, does seem to me to have worked well. I have read criticisms of writers on banking in other countries, who talk of England as being too conservative because she keeps to an old rigid rule, which was adopted to meet a difficulty which has passed away, and which probably will never return quite in the same way. It would seem to me that, if the Government is to prevent difficulty arising in India, not from a real weakness of India, but from the mere absence of the flux—the currency needed to make business move,—it must go on the lines of the 1844 Act, somewhat modified as in the Reichsbank Act. I do not mean that it should follow the letter of the Act, but the principle of it.

11,777. The Reichsbank has the power of contracting its issue when the need for additional currency passes away?—It has the interest to do so.

11,778. It has the power as well as the interest, has it not?—Certainly. I may say that it is generally understood that the Reichsbank Act may require to be altered, because the business of Germany has grown so much since that Act was passed; but the principle is, I think, good.

11,779. (*Mr. Hambro.*) Has the Reichsbank to get any Chancellor's letter, as in England?—No, its action is automatic.

11,780. (*Chairman.*) What do you take to be the immediate effect of a change in prices?—A fall in the value of currency lowers all dues enforced by contract or custom. Creditors and lessors can often defend themselves against injury in this matter; for creditors are often quite as able to foresee changes in the purchasing power of money as borrowers are; and they can accommodate the interest which they charge to coming events. Also they can often put pressure on their debtors indirectly. This last power is even greater in the case of lessors. That is shown in the history of inquiries into agricultural depression. It is always found that, when the rent which the farmer has contracted to pay is higher than the land is really worth, the landlord sees his way to making improvements that he would otherwise have left the farmer to make or to go without; but employés cannot, as a rule, foresee; and they have less power of acting on their knowledge. The consequence is that a rise of wages is seldom or never as fast as that of prices when the cause of the rise is an increase of the currency, that is not accompanied by an increased command over nature.

11,781. Do you hold that the ultimate effects of such a change depend partly on the rate of general economic progress?—Yes. A sudden fall in the purchasing power of currency, that is to say, a sudden rise of prices, may be due to a very bad harvest at home, and then it is clearly an evil; or it may be due to a bad harvest elsewhere, as the rise in Indian prices in 1891

Prof. A. Marshall.

11 Jan. 1899.

was caused mainly by the Russian famine, and that was good for India. But, especially in the West, a sudden rise of prices is generally the result of either currency inflation or improvement in credit. In so far as the rise of credit is a revival after the industrial system has been purged from its impurities by the preceding period of low credit, it is a welcome sign of recovered health. But the movement would be as beneficial for the time if it were accompanied by a more cautious use of credit and more uniform prices; and in the long run it would be more beneficial. As it is, the inflation causes lenders to be careless; all business men seem to be having a large margin of profits; speculative buyers can borrow and become rich by selling for many counters what they have bought for few counters, and their gains, which add nothing to the common stock, are merely the result of successful raids on the common stock; and these gains give to business a fictitious appearance of prosperity. In such times, as is shown by the evidence before the last Commission on Depression of Trade, there is relatively little improvement in machinery and general plant. The seeds of progress are not sown in those times of apparent prosperity. No doubt employment is then generally full, especially if England is exporting fast; and she is likely to be exporting fast in consequence of her lending fast to other countries, South America above all others. When she has been exporting fast to South America, there has been plenty of employment in making goods to be exported, but, as a rule, little has come back afterwards. During that time money wages have been rising very fast, but not real wages. I admit that, on the other hand, a sudden rise in the purchasing power of currency, that is, a sudden fall of prices, presses hardly on business enterprise of all kinds. It is likely to make many employers fail, and generally to interrupt industry. Credit shrinks, and disorganisation is apt to spread from one part of the industrial world to another. Such a fall of prices is an almost unmixed injury to the employé, as it is to the employer; but a fall of prices of this kind is seldom or never the product of natural causes. It is nearly always, if not always, the result of a previous inflation of prices and the launching of frail enterprises by fraudulent or incompetent people who have floated into prosperity at the cost of others on the top of the wave of rising prices. To attribute this social *malaise* to the fall of prices, instead of to the previous morbid inflation which caused it, is as reasonable as to attribute the headaches which follow a night of feasting and rioting to want of a sufficiently nourishing breakfast, instead of to the bad condition of the digestive organs that took away the appetite for breakfast. This is, perhaps, the chief centre of difference between those bi-metallists who, like myself, wish for bi-metallism only as a means of diminishing fluctuations; and those who wish for it also, and perhaps, mainly, as a means of raising prices. It is agreed on all sides that violent fluctuations of prices are an evil in the long run: but the difference of opinion is as to whether it is the sudden rise of prices, or the subsequent fall, which is mainly responsible for the evil. England passed through great crises and violent fluctuations of prices early in the century; and you will find an important body of opinion on the part of not only professional economists, but of business men, at that time that a rise of prices was not really beneficial to industry. But the memory of that passed away, and I will confess that, for 10 or 15 years after I began to study political economy, I held the common doctrine, that a rise of prices was generally beneficial to business men directly, and indirectly to the working classes. But, after that time, I changed my views, and I have been confirmed in my new opinions by finding that they are largely held in America, which has recently passed through experiences somewhat similar to those of England early in the century. The reasons for the change in my opinion are rather long, and I gave them at some length before the Gold and Silver Commission. I think, perhaps, I had better content myself now with calling your attention to the fact that the statistical aspect of the matter is in a different position now. The assertions that a rise of prices increased the real wages of the worker were so consonant with the common opinion of people who had not specially studied the matter, that it was accepted almost as an axiom; but, within the last 10 years, the statistics of wages have been carried so far in certain countries, and especially in England and America, that we are able to bring it to the test. I have accumulated a great number of facts, but nearly everything I have accumulated is implied in this table. It is copied from the article by Mr. Bowley in the "Economic Journal" for last December. It is the result of work that has been going on for a number of years, and seems to me to be practically decisive. It collects the average wages in England from the year 1844 to the year 1891, and then calculates what purchasing power the wages would give at the different times, and it shows that the rise of real wages after 1873 when prices were falling was greater than before 1873 when prices were rising.

AVERAGE REAL and NOMINAL WAGES in the UNITED KINGDOM, FRANCE and the UNITED STATES as Percentages of those in 1891.

Country		1844–53.	1854–63.	1864–73.	1874–83.	1884–93.	1891.
United Kingdom	Nominal	61	73	82	93	95	100
	Real	53	51	59	82	97	100
France	Nominal	52	65	73	86	95	100
	Real	55	61	67	78	94	100
United States	Nominal	53	58	72	86	95	100
	Real	54	53	57	76	95	100

11,782. (*Sir J. Muir.*) Might I ask what is the difference between "nominal" and "real," in connexion with this table?—The real wages are the amount of commodities which the labourer can buy with his money wages. Supposing wages were 30*s.* in one place and 32*s.* in another, the real wages in the first case would be the commodities which 30*s.* would buy at the price of that time, and in the other the commodities which 32*s.* would buy. I may say that all the figures, and especially those for France, are liable to certain errors, which are most conscientiously explained by Mr. Bowley in his article. They are not sufficient to detract much from the force of broad inferences based upon the figures.

11,783. *Sir F. Mowatt.*) I do not quite understand how you get the full value of hundred to-day?—He puts everything up to 100 for 1891, and then works back.

11,784. But does he take the real and nominal as identical now? Where he takes the 100, does it represent the real and the nominal?—He makes the standard for real wages 100 in 1891, and he makes also a separate standard for the nominal wages in 1891 of 100, and then he works it out upon those. I now produce a diagram representing the facts for America. It has been very largely used in America, and has had a great deal to do, probably more than any other single statement of facts, in diminishing the belief

Prof. A. Marshall.

11 Jan. 1899.

among the people that they could improve their position by inflating the currency. (*For this diagram, see Appendix.*) I should say that that diagram is compiled by a mere arithmetical process, from a report made at the instance of the United States Senate Committee. It is, of course, always difficult to be certain that there was no ulterior motive in the appointment of any committee to make a statistical inquiry: but it is quite certain that, if any such motive was at the back of the appointment of this Senate Committee, it had nothing whatever to do with this particular question; and therefore, so far as this particular question is concerned, it may be taken without question as an impartial investigation. The work was practically done entirely by Professor Falkner, who approached the question from a purely statistical and scientific point of view.

11,785. Do you draw any distinction between the cases of England and India in the respect you have just alluded to?—Yes, I do. It seems to me that nature, who often plays unkind tricks as to the supply of gold and silver, has been benevolent in putting a liking for gold into the West, and for silver into the East. For improvements in transport and production have made the labour of the Western worker, and especially of the English worker, very much more effective in producing commodities than it was not long ago. For the Englishman, I should say, it had been nearly doubled, and it is therefore well in my opinion that a sovereign should command nearly twice as many commodities as before. Taking the course of events as it has been, I do not think it would have been good to have had a gold currency in India during this time. That would no doubt have caused a real stringency. Prices would have fallen, not only as measured in terms of commodities, but as measured in terms of labour; because India has not been able to keep pace with the Western world in the command over capital, in the command of those resources which make labour effective. Her unfortunate liking to invest in barren stocks of gold and silver, together with other causes, has made her unable to keep pace with the West, or even with Japan; though, when one complains of the slow progress of India, one must recollect that there is scarcely any other old civilisation in the same latitude, and with the same difficulties, that has made progress to be compared with that of India.

11,786. On what principle should you estimate the amount of interest that the Government of India has in the value of the rupee?—One frequently hears estimates of the interest that the Government has in a rise or a fall of the rate of the exchange on London. Now, I do not think that it is possible to state what that interest is without enquiring whether the origin of the change is in circumstances affecting the rupee or the sovereign. It seems to me that there are these two distinct elements: the Government of India has direct interest in the value of the rupee, and it has interest in the value of the sovereign; but its real interest in the rate of exchange is chiefly indirect. For the effect of a fall in the exchange which was caused by a rise in the value of the sovereign, the rupee being stationary, would be, in my opinion, quite different as regards the interest of India, from the effects of a similar fall caused by a fall in the purchasing power of the rupee, the sovereign remaining stationary. Therefore, I would like to take the two parts separately. The permanent interest of the Indian Government in the value of the rupee is limited to its fixed land dues. In respect of the importance of those dues, it is unique among great governments conducted on Western principles. Its permanent interest in the value of the sovereign is limited to its debts in gold. But, next, as to interests which are not perpetually fixed, but yet are very firmly rooted; it has a very heavy interest in the value of the rupee extending over perhaps 15 years or a little more, the average remaining life of the non-permanent leases. It has also a sub-permanent interest in taxes; because, though equitably it can raise those so as take its share of the growing wealth of the country, its freedom of action is practically limited by the necessity for going rather more slowly and in a rather less aggressive manner in the East than is possible in the West. Lastly, it has an interest as an employer of European labour, in the ratio between the rupee and the sovereign, independent of their absolute values; that is in the rate of exchange. If they both rose equally, or both fell equally, these difficulties would be small. As regards railways, I think those difficulties are, perhaps, less than appears. For I do not think it is possible for a railway ever to have fixed upon the ideally right tariff, and I think that the number of cases in which any railway would lose much by deliberately lowering its tariff is small; and, therefore, I think that the indirect lowering which arises from a fall in the value of the rupee, is not so great an evil to the railways as is commonly supposed. As regards the prices of stores and railway plant, the Indian Government has no interest in the value either of the rupee or of the sovereign, in addition to the considerations already mentioned; because it buys them as a trader, and gives commodities for commodities. These difficulties are in themselves considerable, but the main importance of most of them arises from their bearing on the central difficulty of the position of the Indian Government, which is not directly connected with either the rupee or the sovereign, and would remain if the whole world had the same currency. This difficulty is that the immense increase in the wealth and prosperity of the Western world, which began in the second third of the present century, and has gone on at an ever-increasing pace since the close of the period of the great wars, has made the resources at the command of the Western Governments beyond all comparison greater than any known before. These resources are spent on civil government and on military preparations. The administration of law, education, and sanitation are more thorough and more costly in terms of labour, and far more costly in terms of commodities, than they were. Military expenditure has grown perhaps even faster. If the supplies of gold had been sufficient to maintain uniform prices of commodities, then the apparent expenditure of all Western Governments outside the service of their debt would have been nearly doubled. The present direct expenditure of the English Government would be perhaps 150 millions, and that of local authorities about as much again, after deducting for post office, waterworks, and other remunerative outlays; and the people would have probably protested effectively against the increase. As it is, they have submitted more or less willingly. In the East there has been no such surplus to dispose of, and yet moral considerations have required the Indian Government to follow at no very long distance behind the Western Governments in their civil undertakings. As regards their military undertakings, I do not wish to express any opinion as to their necessity. I am no judge of that. But, as to the civil administration, the English officials have to be brought away from a country where real salaries are high. And, while I fully recognise the duty of the Government to substitute cheaper services wherever they would do the work; and while I hold very strong views as to the wrongfulness of any unneedful expenditure of Indian funds—while I hold that that is short-sighted and foolish, as well as wrong—I yet think that the purchase of services that are inadequate for their work is wasteful; and I do not think that India could obtain the services she requires, taken one with another, at a much cheaper rate. I wish to say that, because, having a good deal to do with the teaching of students who are natives of India, I find that they often do not hold what I consider sound views upon the conditions of true economy in public administration; and I think I ought to bear my share, as one of my generation, in insisting that, on the whole, taking one thing with another, the Civil Government of India is not an expensive government. Were it an expensive government, I think our presence in India would not be justifiable. In view of this

central difficulty arising from the fact that the standards of civil and military efficiency which are set by the West must needs put some strain on the less progressive resources of the East, I think the financial policy of India may be justified in departing a little from those maxims of perfection as to the preference for direct taxation to which the English Government should adhere; and, I think, it must take more account of popular sentiment than it would be right for the English Government to take. I think it must ease its way by not accentuating needlessly the burdens which it is compelled to impose on the people. If the people could appreciate both sides of the question fully, that would be the best of all; but, as they cannot be expected to appreciate fully the necessity for the growth of costly civil and military operations by the Government, it is, therefore, best not to make them think that the Government's revenue and expenditure are increasing faster than they really are. In short, I conclude that moral and material progress are imposing new and costly duties on the Government of India, and armaments are increasing everywhere; and, therefore, although the net amount of its fixed sterling payments is, perhaps, somewhat less than at first sight appears, its expenditure measured in terms of commodities must constantly increase, and should be raised in the least irritating manner possible.

11,787. Before leaving that branch of the subject, will you say whether you regard the maintenance of the rupee at 1*s.* 4*d.* as equitable, and, at the same time, do you regard it specially as a tax upon trade?—The function of a legislator as regards currency is to do as little as possible. Almost any currency of which the position is certain will do its work fairly well. Frequent changes in its basis disturb expectation, upset reasonable calculations, and infuse a spirit of unrest into business. They may all aim at increased certainty, but their effect must on the balance be increased uncertainty. They resemble the frequent wakings of a patient in order to administer sleeping draughts. It was, therefore, with much doubt and difficulty that I brought myself to think that it was right to close the mints in 1893. But some of the strongest arguments against closing them then are now arguments against reopening them, and against acquiescing in any other arrangement than a 1*s.* 4*d.* rupee. I base myself partly upon the consideration that the original revenues were fixed in rupees—not gold rupees or silver rupees, but rupees—and that gold coins were legal tender well into the present century. I think, therefore, that the descendants of the original holders would have had no technical grievance if England had adhered to the gold standard throughout. Of course, the position of the Indian Government is weakened by the fact that, when gold was showing a sign of falling in value, it refused to take gold as legal tender. But still, taking history as a whole, I cannot see any technical breach of contract in moving the rupee somewhat in the gold direction. Looking at the thing broadly, and without reference to recent events, I should think that it would not have been an unjust arrangement to say that two-thirds of the rents should be paid in terms of silver, and the remaining one-third in terms of gold. Now, if you take one-third of a rupee at its old gold value, and two-thirds of the silver in a rupee, you do get just about 1*s.* 4*d.* It seems to me, therefore, that, if the fixed rents were allowed to be paid in rupees, with open mints, this very great fall in the value of silver would throw the whole burden, or more than the whole burden, of the necessarily increasing expenditure of the Government upon taxpayers other than the permanent and sub-permanent holders; and in that there would be an inequity. I think it would relieve them of some part of their proper share of the public burdens, and would thereby impose an unjustly large share of those burdens on other taxpayers. A slight injustice of this kind is sometimes a less evil than its remedy; but a rupee at 1*s.* 4*d.* seems to me a workable compromise, and substantially just for public and private business contracts. While the evil arising from a change in the currency was an argument, for what it was worth, against the closing of the mints, it is no argument at all in favour of reopening them. On the whole it seems to me, as I have said, that a rupee at 1*s.* 4*d.* is a workable compromise; and, although I have seen it stated that it is a tax upon trade, I have not been able to see that it is any tax upon trade at all. It is a tax upon those who have a specific quantity of rupees to pay under contracts made or implied during the very short time that the rupee was of lower real value than now; but, so far as future trade is concerned, it seems to me to be a change exactly like the adoption of the decimal system, and using the kilogram instead of the pound.

11,788. What do you take to be the general relation between the Indian exchange and prices in India and England?—India is so large that prices at her ports differ widely from up-country prices; and, partly for this reason, much of the produce of India is very little connected either as cause or effect with the course of trade. But, broadly speaking, the Indian exchange, both before and after the closing of the mints, has indicated the proportion between rupee prices at Indian ports and sterling prices at English ports; and, subject to allowance for freights, &c. between India and England, the rule holds that the exchange, or the gold price of the rupee, is the ratio of sterling prices to rupee prices. Before passing to the way in which that works out, I would like to say a little on the interpretation of the phrase "general prices in India." I have seen in current literature a good many arguments as to the general policy of the Government with regard to currency in India, which seemed to me to be incorrect, because they are based upon a comparison of London prices and Calcutta prices, and the tendency of progress is, of course, to raise up-country prices of exports relatively to Calcutta prices. The papers written 50 years ago by Colonel Sykes, who, I think, was the first person who paid very serious attention to the higher statistical problems of India, showed very great differences between the up-country values and the tidal-water values. It is especially interesting to study these differences in the case of America, because America is on a gold basis and there is no break of gauge in passing from America to her chief customers. A number of people have made enquiries showing the relative movements in different parts of America, and I think it may be said to be established, broadly speaking, that there has not been any great fall in gold prices of agricultural staples up country. I have here one of a series of papers issued by the Sound Currency Committee of New York; and, though it is avowedly written for a purpose, I think we can trust the diagrams, which show that the prices of agricultural produce at Dubuque, Iowa, fell much less than at tidal water. And here I have an elaborate set of diagrams, showing similar results for up-country markets throughout the United States, by Mr. Powers, Commissioner of Labour for Minnesota. His figures have been criticized; but their general effect has not been shaken. No one can look at these general results of Indian and American statistics without concluding that the statement that the prices in India have not risen lately is not a justifiable statement, if it is based upon Calcutta prices, and without allowing for the differences between up-country and tidal water prices.

I have now to enter very much upon controversial matter, and perhaps it would be well that I should first state what is, I think, a matter of common agreement as to the causes that govern Indian exchange. It is common ground that Indian exchange is raised—that is, made more favourable to India in the old technical sense of the word, which means more favourable to importers, and more unfavourable to exporters—by an increased foreign sale of Indian products. This may arise from increased foreign eagerness to buy these products, resulting in an improved rate of value for them in terms of the goods offered in foreign markets, or from increased Indian

Prof. A. Marshall.

11 Jan. 1899.

supplies of them at the old value. Or it may arise from diminished Indian purchases of foreign products, including gold and silver; and this may be caused by a diminished eargerness on the part of India for them, or by diminished offer of foreign stocks of them at a rate which India will pay. Further, the Indian exchange may be raised by increased borrowings by India. It seems to me it is worth while to have these general considerations before us; because they seem to show that, as regards discount, so with regard to exchange, no general proposition is possible. One cannot say that a fall of the exchange is good for a country or bad.

11,789. You say, "Speaking generally, the Indian "exchange is the ratio of sterling prices to rupee "prices at the ports." Will you kindly amplify that?—The Indian exchange is quoted as the sterling price of the rupee, that is, as the price in London of the command of a rupee's worth of goods in Calcutta or Bombay. If the exchange is not by telegraph, something must, of course, be allowed for interest. It is worth the while of an English importer of, say, jute, to pay this price for a rupee, if the jute that he can get with a rupee will sell *net* in London for this price. By *net* is meant, after paying all the expenses; *i.e.*, including insurance, interest for the time the capital is locked up in transit, and remuneration for himself. Thus Indian exchange is the ratio which the sterling price of jute, after allowing for freight, &c., bears to the Indian price. In the same way, the exchange is the ratio that the sterling price of calico bears to the Calcutta price after allowance is made for freight, &c. The details of this had, perhaps, better be taken separately for the case in which the imports of silver directly affect the currency of India, and the case in which they do not. The latter case is really the simpler.

11,790. Now, will you say how this works out?—Since the mints were closed, the currency of India has consisted of Government notes printed on silver. Their value is governed in the main by their amount relatively to the work which they have to do; account being taken of the fact that apprehensions as to the stability of the value of such a currency will affect the amount of purchasing power which people care to keep directly or indirectly in the form of currency. The Indian exchange is then governed by the relation between gold prices and rupee prices, being, in fact, an expression of the ratio between them. I will work this out in detail with reference to the trade of the all-round merchant. There is not, really, a very great difference between his case and that of the man who exports without importing in return; because, by aid of the exchange banks, the mere exporter is now almost in the position of the all-round merchant. The all-round merchant's case is the typical case. I mean the man who exports and imports back again. If an all-round Calcutta merchant exports jute and imports calico, he makes a good business, provided, first, jute is in great demand in England and calico plentiful there, so that he can get much calico in London for the price of each bale of jute; and, secondly, calico is in great demand in Calcutta, and jute plentiful there, so that he can get much jute in return for each bale of calico which he imports. These are the things that really affect his prosperity. The currency does not affect it directly. If he knows that he can get 100 bales of calico in London for the price of 300 bales of jute, he does not really want to know what the price is, it might be given to him in a sealed bag. If the contents of the bag were guaranteed to purchase him his 100 bales of calico, that is all that he would want to know. If the 100 bales of calico would sell in Calcutta for the price of 450 bales of jute, and the price of 150 bales would enable him to pay all expenses of the double traffic with profits to himself, then the business would be profitable, otherwise not. If there were to be a suddenly increased issue of rupees, and Calcutta prices rose, so that Rs.120 were needed to do the work of 100; then the exchange would instantly follow suit, if there were no other disturbing cause at the time. But, of course, there might be a disturbance. The credit of the country would, perhaps, be lowered, and this might make foreigners withdraw capital from it. That withdrawal would injure the country as a whole, and the exporters themselves in the long run; but, for the time, it would be a powerful bounty on exports: and a real bounty due to that cause exporters sometimes get, and attribute it to a different cause, viz., the direct action of the fall in the exchange. Again, the change under discussion—the increase of the currency—might lead people to avoid rupees and seek gold and silver bars for their hoards. This is a special case of an increased desire on the part of India for a commodity (silver is now one) such as silver, petroleum, and diamonds, from whatever cause arising. Let us, then, leave this illustration with regard to an increase of the currency, and take what has been, in fact, the chief cause of increased purchases of these commodities by India — the increased output of American and African mines. Well, the increased desire for petroleum, diamonds, and silver, any or all, would make India bid more eagerly for foreign produce, and give more jute, &c., in return for it. The way in which this would work out in the exchanges would be as follows: The importers of diamonds, petroleum, and silver, would need bills on London, and pay an increased number of rupees for a bill for 1,000*l.*, that is to say, in technical terms, the exchange would fall. Its first effect would be to give a real bounty to exporters of jute, and impose a real burden on importers of calico. After a while, the price of jute would have fallen a little in London, and the price of calico would have risen a little in Calcutta. The rupee would count for less relatively to calico, the sovereign for more relatively to jute. The all-round merchant might have to sell 320 bales of jute instead of 300 in London, in order to get 100 bales of calico, but he would get his own again because he would sell his calico at home for the price of more jute than before. And if, in this state of the trade, he stopped off from importing, he would require to obtain a larger number of rupees than before for a bill of 1,000*l.* Thus the increased demand of India for foreign goods would lower the exchanges, and it would keep them low so long as there was no other change in the situation except this increased demand; that is, especially, so long as there was no change in the supply of rupees or gold relating to the work they had to do, and this supposition implies that the mints are not open to silver. A permanent alteration in the rate of exchange due to such causes as these is the outward expression of a change in the real terms of trade between India and other countries. But an alteration in the exchange due to changes in the currency of India or other countries has no such deep signification. It may disturb the business relations of individuals, it does not as a rule modify the substantial trade relations of countries. Even if the Indian mints were never reopened to silver, an increased production of silver in the West might lead to a permanent increase in India's eagerness for foreign imports, and a permanent alteration in the terms on which she obtained them, just as was done on a smaller scale by the African diamonds and the American petroleum. The case of silver resembles that of diamonds more nearly than that of petroleum. For, if the price of petroleum falls, people buy more of it to use at once; they do not wait to see if the price will fall even more next year. But with diamonds and silver it is different. A fall in their price sometimes make buyers more eager, sometimes it makes them hold off in expectation of a further fall. The want of correspondence between changes in the real price at which silver could be bought, and the amount of it which India will take, may, perhaps, be explained by those who know the history of Bazaar rumours. I have been told by natives that there is a good deal to be learnt in that direction. Of course, I never got below the surface at all, but to me it is inexplicable. The common

saying that the course of the rupee cannot be predicted as that of any Western coin can, seems to me to derive its chief justification from this fact. It seems to me that nearly everything is explicable about the rupee with a little patience; but on this point I confess the action of the rupee is quite inexplicable to me. What I cannot understand is the relation between the price of silver and the imports. For instance, if one takes a diagram showing the net imports of silver into India, and the net imports of gold into India, and the rate of exchange, one has a paradox that one cannot solve (*see Appendix*). I thought that such a diagram must yield something to study; but, though the causes of some of the most striking movements of these net imports are well known, I can get nothing out of it that suggests a general law connecting movements of these imports and movements of the exchange. As one instance, I may mention that the Superintendent of the Post Office for the North-Western Provinces in 1886—I am quoting second-hand—states that the import of gold was increased considerably, because of the rise in its rupee value. People thought that the rise in its rupee value was going on fast, and for that reason they imported on a very large scale. But in 1892-93 gold was on the balance exported, because speculators and hoarders took their profits on the purchases of earlier years, preferring not to wait longer.

11,791. Do you wish to say anything as to the different relations which affected the question when the mints were open?—When the mints were open, importers of silver into India were secure of a better market, and therefore a fall in the Western price of silver was liable to disturb trade more. There were some re-adjustments of price levels, rupee prices at the ports being specially plastic, as Mr. O'Conor has told you. Sterling prices might yield temporarily a little in some cases, but ere long equilibrium was reached with more silver and higher prices in Indian ports than there otherwise would have been. To go over this difficult question again somewhat in detail: the gold price of silver having fallen, either the relation between gold and silver prices of the chief commodities in trade would quickly re-accommodate itself to the new gold value of silver or it would not. If it did, as in my belief it would, the rupee prices at the ports would rise nearly in proportion to the increased value of gold in terms of silver. It is however true that, if there happened to be a growing scarcity of gold, or growing facilities for the production and transport of cotton, iron, &c., the gold prices of these things might fall to meet the rupee prices; (and this did in fact often happen between 1873 and 1885). In whatever way the re-adjustment was made, provided only it was made quickly, the premium on the exportation of Indian goods in return for silver would be small and would quickly pass away. If on the other hand there were no rapid re-adjustment of relative prices, the premium on the importation of silver would lead to a bottomless demand for it. Silver would be exported by 20,000,000*l.* or 30,000,000*l.* worth a year, if there were no re-accommodation of the relations between gold prices and silver prices. For it would then be profitable for anybody whatever to buy silver and take it to India and buy commodities, and the flow of silver to India must reach enormous figures. As a matter of fact, there has never been any large and persistent import of silver into India which can be attributed to this cause, and therefore we are compelled to admit that prices at the ports accommodate themselves very quickly to the new conditions. I do not say that inland prices accommodate themselves rapidly.

11,792. Would you wish to add anything on the question whether a depreciating currency gives a bonus to any of those engaged in producing for export?—The influence of a relatively depreciating currency upon the position of the exporter has been the subject of a very long controversy in which I have taken a somewhat lengthy part, as a good deal of my evidence before the Gold and Silver Commission bore upon that subject. I find that those who think that a relatively depreciating currency gives a bounty to the export trade, generally quote in support of their conclusion facts which I should not dream of calling in question, and I think it may be well to state what seem to me to be matters common to both sides, matters which are not in dispute. The dispute is whether from these facts it follows that a depreciating currency gives a bounty to the export trade. It is common ground that, if the price at which an exporter sells his goods in foreign markets be taken as fixed, then a fall in the value of his own currency, relatively to foreign currency, of one per cent. increases his gross currency receipts by one per cent., and is likely to increase his profits in a much larger proportion, or to turn a loss into a profit. Expert witnesses have been called, and numerous expert writings have been written by people making a point of the fact that they are actually engaged in trade, and in a position to prove that this is the experience of practical life. But really no experience is needed: the result follows from an elementary application of the first rules of arithmetic: and it has never, as far as I am aware, been doubted by any person in the world. It is common ground also that, if the currency in India is rising in value, while that in, say, China, is falling in value, then the employers in India, having to pay relatively increased fixed charges, salaries, wages, &c., may be complaining of hard times, while the employers in China are making good profits. This will, perhaps, be expressed by saying that currency changes are giving an advantage, or a premium, or a bounty to the Chinese employers as compared with the Indian. If these employers in India are producing for export to foreign countries, they may be described as exporters; and it may be said then that the Chinese exporters have a bounty in comparison with the Indian exporters. But this appears to me to be an incorrect way of expressing an undoubted fact; for, first, the gain of the Chinese employer is independent of the accident that his goods are exported; and, secondly, it is at the expense partly of the creditors who are financing his export industry, but mainly of the employés in it. Now, if one says that the export trade of a country is conterminous with the undertakers of business enterprise, who are generally employers, and that anything that benefits the employers is a bounty on the export industry, then the proposition may be conceded. But, as I hold that the creditors who finance an industry that produces for export have some share in the export trade, and that the employés who make the thing for export have a very large share—quite as large a share as the undertaker,—holding that, I do not admit the proposition. If the statement is that a depreciating currency gives a bounty to the employer who is producing for export, I admit it; only, I add, the bounty is just the same, and at the expense of just the same people, as that which he would get from a depreciating currency if he were producing for his home market, and not for export. Again, it is common ground also that, when a country lends capital or returns any of its borrowings, or increases its payment of foreign dues (for example, increased sales of Council bills), or has increased its imports above their wont, then there is an increased demand for exporters' bills; that this is necessarily accompanied by a fall in the value of that country's currency relatively to foreign countries, causes a stimulus to exports, and increases, for the time, the profits of exporters. But all this does not go to show that a depreciated currency is a bounty to exporters in the way of causing an increase of exports relatively to imports. On the contrary, any stimulus to exports relatively to imports which is not accompanied by lending to foreign countries, or returning loans, must necessarily be followed and compensated, by an exactly equal falling off of exports relatively to imports. For it causes an excess of exporters' bills, and that gives at once a bounty to imports. If the bounty is not sufficient, the discount on exporters' bills rises, and, therefore, the

bounty on imports rises, until precious metals or other goods come in. In other words, a bale of jute has to be sold in London for a price that will bring back enough yards of calico to fetch, in Calcutta, a price that will pay for the jute and the expenses of the traffic. Here I am getting back on old ground. Whether this can be done or not depends, so far as London goes, on the needs of England for jute, in comparison with their power of producing calico; (sovereigns are mere counters in the transaction); and, so far as Calcutta goes, it depends on the needs of India for calico, in comparison with her power of producing jute. Rupees are mere counters in the dealings between the two nations, though not in the dealings between individual members of the nations. Nor is the case altered if we interpose a third country, and look at the competition in neutral markets between countries with a depreciating currency and countries with a currency that is not depreciating. Let us suppose, for instance, that China tea and Indian tea of equal quality are sold in London, presumably at the same price, and therefore in return for the same amount of English goods. If the Chinese currency is depreciated, a smaller part of the value of these return goods will have gone to the employés and to the creditors in China with whom the capitalist tea grower has relations, but that is a distribution within the country. It is a gain of one class at the expense of another. The change in the currency does not affect the amount of calico which can be brought back for a chest of tea of a given quality, and therefore it does not affect the advantages of the trade as between the nations. Of course, both countries have dues in Europe, and cannot bring back European goods in return for all their exports, China and India being both borrowers; but, so far as these are concerned, local currency counts for nothing at all. The question that is of importance to them both, as regards paying dues in London, is, whether they must give more tea to buy the means of paying 100*l.* in London than before; and, if the Chinese tea and the Indian tea are of equal qualities, the same number of pounds of Indian and Chinese tea will go for the purpose of paying a given due. It is, however, quite natural that capitalist employers in a country in which currency is not depreciating, should look with envy on the position of those who can pay wages and other dues in a depreciating currency, and therefore retain for themselves a larger share of the price which they get for their goods, whether sold in the home or foreign markets. But this envy has little effect on the course of trade. If gold prices have remained stationary, while the rupee has depreciated 10 per cent. in terms of commodities, then the employer in India is better off than English employers. He gets 10 per cent. more rupees for his produce, whether he sells at home or abroad: he has to pay but few more rupees in wages, since wages have not risen fast; and so he gets higher profits whether he sells at home or abroad. Most of his sales are, in fact, to gold countries; so he regards as a benefit arising from the exchange and accruing to the trade what is really a benefit arising through the depreciation of the currency and going to the employer chiefly, but being taken from the employé.

11,793. Do you think India especially hindered from obtaining a gold standard, or a gold currency, by reason of her poverty, and the fact that she has to make gold payments?—I think she is hindered, but I think the difficulty, on examination, appears much less than at first sight. The difficulty of keeping gold in a country seems to arise from its having been required to make large payments abroad, especially on short notice. When foreign capitalists withdraw their capital, which they commonly do when credit is bad, something or other must be sent to meet the country's obligations, under pain of bankruptcy; and those things which have the most elastic market, and are most easy of transport, naturally go first. Diamonds are as easy of transport as gold, but they have not as good or as quick a market as gold; therefore, gold goes first, and silver second, if a country is outside of the Western world But in the Western world the first line of defence is not now in gold or in silver; the first line of defence is in International Stock Exchange securities. Poor countries, unfortunately, seldom have such; they hold very few securities, except their own, and those are specially unmarketable at such a time. The developments of modern business have caused a country to be liable, under severer penalties than before, to pay up many millions' worth of capital at short notice; and this first line of defence, International Stock Exchange securities, is not largely available for poor countries, including, I believe, India. I admit that to be a very great difficulty, but that seems to me to be the only point in which India is in a specially bad position. As regards the second line of defence, the precious metals, she is perhaps in a particularly strong position. She normally imports 11 crores' worth, and, therefore, she could pay 11 crores abroad by merely suspending her normal imports. The third line consists of goods which are portable, valuable, of elastic demand, having well-organised world markets, and having also a well-organised local machinery for collecting them from up-country, and putting them on world markets. In this third line, India is stronger than almost any other country that is not rich. Her exports of cotton in various forms equal about 20 crores, and imports of cotton nearly 30 crores. Now, cotton is a portable commodity, and elastic in the world's demand; and, therefore, by importing less and exporting more, she could meet a portion of her debt. Again, she exports hides, rice, and tea for about 30 crores. The world markets for hides and rice are large and elastic; and, so long as Chinese competition remains strong, it may be said that the market for tea is elastic, because Indian tea could push out Chinese. If Indian tea had completely pushed out Chinese tea, then tea would be for this purpose rather a bad defence, just as coffee is in the case of Brazil. Jute, I should think, is also elastic, since there are other fibres in some competition with it, though perhaps not so elastic. Moreover, there are some (although not many) of India's imports, other than cotton goods, which are not indispensable.

The witness withdrew.

Adjourned.

Professor ALFRED MARSHALL, recalled and further examined.

(16th February 1899.)

Prof. A. Marshall.

16 Feb. 1899.

11,794. (*Mr. Le Marchant.*) In your evidence at question 11,765 you say that the "high rate of "interest on permanent investments in India seems "to be attributable partly to a relative scarcity of "real capital." Would you from that regard the addition to the currency under open mints as not having increased the real capital of India?—In my opinion it does not. It is very difficult to say what position the metallic currency of a country holds in its real wealth or real capital. It is a matter on which there has been a great deal of academic discussion; I think, to a great extent, the discussion has been with regard to the meaning of words. If a country has an unsound currency, say a paper currency, liable to large fluctuations; and imports bullion to put that currency on a sound foundation; then it does get a return for the expense to which it has been put in getting a sound currency. But when once it has got a good currency; then if, through an unfortunate increase in the production from the mines, it has to import a good number of millions of ounces of precious metals in order to make a more diluted currency do the work that the old currency did well before, that seems to me to be no increase of wealth; the country is giving its real capital in return for a thing that merely causes people to carry about larger purses, and—so to speak—use more cumbrous weighing machines, without any increased in their real wealth.

11,795. If the additional currency is sent there because it is cheap in terms of the money or of the commodities of foreign countries, if it is sent in preference to other commodities because it is the cheaper thing to send, there is a strong probability, is there not, that it will not be a gain to the country receiving it?—So far I should say there will not be a gain.

11,796. And the degree to which it would add to the real capital would depend on the circumstances of actual want for it and the uses of it?—Yes. It would depend very much, I think, on the question whether the currency without that increased supply of precious metals was in a wholesome condition, or in one in which it was liable to be unduly disturbed by shocks to general credit.

11,797. It has sometimes been suggested that, with open mints, the additional currency that arose from silver imports was a natural increase of Indian capital as distinguished from foreign capital, and formed a fund available for promoting local enterprises which would otherwise have depended on foreign capital?—It does not seem to me that that statement, as it is commonly made, and as it is commonly understood, is at all true. At the same time I should be unwilling to give it a direct negative, because there does seem to me to lie concealed behind it a certain element of truth. It seems to me that, as India is passing from what we may call a mediæval condition to a modern Western condition, it is using a great deal more currency as a specific medium of exchange on modern methods in lieu of the old fashioned barter and payment of dues in kind. That is giving India a commercial power, which she can only obtain by this means, that is, by having an increased number of what I may call weighing machines. So that, had the general level of precious metals not been disturbed by the increased production of the mines at all, I think it would have been necessary for India (unless she had developed a banking system which could not be expected in the circumstances), to import extra bullion in order to put her machinery of exchange on the efficient but expensive Western system. And, so far, I should not say that the bargain was a bad one for her. I imagine that part of the importation of silver was caused by this need for increased Western appliances and was not to be regretted, and so far did give her an increased power of meeting her own needs and supplying those things which meet the needs of the rest of the world, and thereby caused them to contribute to her needs.

11,798. So far, in fact, as it supplied the necessary mechanism of circulation, which in this country would be provided by expansion of credit money or by banking devices, to that extent it would be an advantage?—Yes, by expanding credit money or of course, expanding coin.

11,799. Would you regard the importation of silver as having contributed directly to a higher level of prices in India?—Yes, I think the level of prices is higher than it would have been had there not been so much importation of silver for currency purposes. Had silver not been imported for those purposes, then I think prices could not have risen and would probably have fallen, because there was an increased demand for currency owing to the adoption of Western methods of business.

11,800. So far as the additional silver caused labour to be brought into operation and production, to that extent it would have contributed to the increase of wealth?—Yes, or so far as it enabled people to do their business by the Western methods, which are more quick, precise, and elastic, and, generally speaking, efficient than the primitive methods.

11,801. How far would the same facilities exist under a gold standard? Would the same essential conditions exist?—Broadly, yes. The term "essential" is a little difficult to understand. The existence of a gold standard without a gold currency would, of course, act in certain important respects differently from a silver currency.

11,802. With regard to discount and the volume of currency as affecting it, would you regard the rate of discount as affected not so much by the total volume as by the distribution of the currency—the hands in which it stands?—I should think that that was largely true.

11,803. I think you refer more especially to capital rather than currency in that relation; I gather that you viewed capital as being the command of currency?—My own way of looking at things is this: I prefer to talk of currency as giving a command over real capital, and bank money as giving a command over currency, and therefore giving a command over real capital in a secondary degree.

11,804. Assuming that there was a scarcity of currency in banking circles that would involve a high rate of discount?—Certainly.

11,805. It would also depend, would it not, on the facility for introducing fresh currency from abroad?—Certainly—the facility and the time required.

11,806. At the moment of demand?—Yes.

11,807. There might be different conditions bearing on the introduction of fresh currency, according as the standard was silver or gold?—I should think so, probably. Perhaps I should say that I have been a good deal surprised at seeing it stated frequently before this Committee that high exchange and high rate of discount habitually go together. I understand that that is the prevalent opinion in the business world in Calcutta. It does not fit in with what I should have supposed *à priori*, and, on looking at the chart, I find that, so far as yearly fluctuations go, the opposite seems to be rather the rule. Indian banking is a matter on which I feel myself beyond my depth, but I feel that I could not talk with any satisfaction about the relation between discount and prices until this doubt of mine has been laid before the Committee. I am not able to see *à priori* why there should be that correlation, nor am I able to see that there has been. The charts, on the contrary, seem to me to indicate not only that that law does not hold, but that the opposite law holds as a rule from year to year. And that has led me to guess at the cause of this general opinion; and I think it may be possible

Prof. A. Marshall.

16 Feb. 1899.

that the movements under discussion are mainly those from week to week, and month to month, rather than from year to year; and, secondly, that there may be a great difference between the effects of a scarcity or of bad crops of food grains, and of those products which are chiefly used for export. In this diagram the red curve is the rate of discount, and the green curve is the rate of exchange (*see diagram in the Appendix*). I cannot see any general tendency for their movements up and down to coincide; rather it seems to me that often one goes down and the other goes up.

11,808. Might the relative movements of the two differ in the case of countries such as India and England, which are not on a common basis, whereas, if you take capitals like London, New York, and Paris, where gold is the basis of currency, and passes most easily from one to the other owing to their extensive banking relations, the rate of discount might more quickly affect the rate of exchange?—I said in my first day's evidence that I could not trace any general connexion between high rates of discount and high exchanges statistically with regard to the world in general, or with regard to India in particular, and that I could not see why there should be any such coincidence. India seems to me to stand on a different footing from England. First, so long as it had silver, because the rate of exchange was liable to be violently disturbed by causes that had nothing to do with India's special circumstances or trade—to be disturbed much more violently than the gold exchange could possibly be disturbed between two neighbouring countries such as England and France. Secondly, because the business of Calcutta appears to me in many respects to follow lines more different from those of the rest of India than the business of London does from the lines followed by the rest of the business of England. And, thirdly, because the difference between the effects on Indian business of a check to the supply of the things that India consumes herself, and the effect of a check to the supply of the things that she exports has nothing exactly corresponding to it in a western country. My own guess is that a famine or generally a scanty supply of food grains tends to raise discount, partly because it draws currency from the banks, and generally from Calcutta and Bombay, to the uplands. That guess receives some support from a comparison of the black, blue, and red lines in this diagram (*see Appendix*). But I think that a very active export season, which itself is generally a consequence of very fine crops of things suitable for export, also raises discount. So that I should rather suppose that, when it is said a high rate of exchange goes with high discount, what is meant is that, given the amount of currency available for general trade purposes, and the amount of bank money available in Calcutta, if the export trade is active, you will have a high exchange and a high rate of discount. That is the only solution I have been able to guess at of this paradox, that, speaking broadly, a high rate of exchange seems to go, not, as has so often been said before this Committee, with a high rate of discount, but rather the other way.

11,809. (*Chairman.*) I do not think that has been the uniform tendency of the evidence given before the Committee. For instance, when Lord Rothschild was before us, he was asked by Mr. Le Marchant, "There "would be no necessary connexion between a rate "of exchange and a high rate of discount?" and Lord Rothschild said, "I do not think so." The Committee, of course, have come to no conclusion upon the point; but I simply wanted to draw your attention to the fact that, on this particular point, you have the high authority of Lord Rothschild in agreement with your views?—Yes. The distinction which I wanted to bring out was this. It may be true that the minor movements in the busy season o exchange and discount go together. That is indeed what I should expect as regards the slight variations from week to week and month to month, especially from week to week; but it does not seem to me that, comparing one year with another, these statistics, which are among the few that are beyond the possibility of doubt, support the motion that high yearly rates of discount and of exchange go together.

11,810. (*Mr. Le Marchant.*) In fact, would you say that, if the high rate of discount is owing to adverse causes, such as exceptional expenditure on famine relief, which have altered the usual channels in which currency flows, a high rate of discount would be likely to concur with a lower exchange—from insufficiency of exports?—It might. At present I feel great difficulty in putting forward any general proposition with regard to them except that when business slackens they would both be lower, both being affected by the same cause. It seems to me to be something like the question whether a greenhouse is likely to be hotter when there is a good fire in the stove. The bigger the fire in the stove the hotter the greenhouse, of course; on the other hand, the colder the weather is, the colder the greenhouse will be, and therefore the bigger the fire must be. Just in the same way the rate of discount is continually raised because exchange is low, and with the effect of raising exchange. You get two sets of causes, one of which tends to make a high rate of discount go with a low rate of exchange; and the other set of causes tends to make the two rates be high together, and low together; and I have not been able to see either *à priori* or statistically that one of these sets of causes prevails over the other. Speaking generally, with regard to England, I suppose that the high rate of discount does force exchange up, and bring in bullion quickly; and that, if the high rate of discount is for any reason maintained after the country has attracted the gold that it needs from abroad, then you may have for a certain time high rates of discount with a falling exchange. But the supplies of the material of currency in India being so very far off, the time and cost of transport of bullion being so much greater than in the case of England, I should not be able at all to guess *à priori* the extent of the power that the discount would have over the influx of bullion, and through that over the exchanges.

11,811. (*Mr. Campbell.*) Has it occurred to you that the rate of exchange with open mints depends very much on the price of silver?—Most certainly. I discussed that.

11,812. And that, if the cost of silver were tending downwards over a course of years, you might have a declining exchange, even although you had periods of stringency in the money market?—Certainly.

11,813. That is a very important factor in the question, is it not?—Certainly.

11,814. (*Mr. Le Marchant.*) You were referring, in your answer to question 11,773, to the dependence of India on foreign capital. The opinion has been advanced that foreign capital is not so beneficial to India—that it entails a yearly drain for remittances. How do you regard that?—I cannot see a reasonable foundation for that opinion at all. I hold in the most clear, and, if I may say so, confident, manner the opinion that there never was a country which needed foreign capital more than India does. It needs foreign capital partly to enable India to throw aside those mediæval methods of production which still prevail in many branches of industry—to develop means of inter-communication in all directions, and partly to educate the natives themselves to store up capital. When the natives have once got to see that the function of a surplus of income over expenditure is to be devoted to making the future happier, then, I think, their own capital will grow, and India may be able to move fast ahead, somewhat as Japan has been doing lately, with less dependence on foreign aid. But a check to the use of Western capital in India at the present stage would seem to me to be the greatest calamity that could happen to her.

11,815. At question 11,790 you say, "An alteration "in exchange, due to changes in the currency of

"India or other countries has no such deep signifi- "cation." Would you regard a change from a silver to a gold basis as in any way calculated to disturb the permanent trade relations of India?—No, I should regard it as like a movement towards bringing the railway gauge on the side branches of the world's railways into unison with the main lines.

11,816. And promoting a facility of interchange? —Yes.

11,817. You are aware of the opinion often expressed, that it would disturb the balance of exports and imports, and thereby render the payment of obligations more difficult?—Yes, I have heard that opinion.

11,818. What importance do you think should be attached to the apprehension as to the imports becoming excessive and exports deficient?—To myself personally the matter has unfortunately been one of considerable importance. There is no other question on which circumstances have caused me to spend so much time in controversy against my will. I am quite clear that it is impossible for a country's exports to increase relatively to its imports, except when it is sending away capital, provided no part of her dealings with other countries is omitted from the reckoning. It may not be easy to see how the adjustment is being made. But this statement that whatever a country buys it must pay for unless it is borrowing, unless some other country is making it a present, seems to me to be as true with regard to the trade between countries as it is with regard to the budget of a private person. If a person says he is getting a great number of things and is not paying for them, I should then say, "Then you must be borrowing." If he says, "No, I am not borrowing," then I should say, "Somebody must be giving you things." Or as a last resort, he must be stealing. These last two explanations, of course, would not apply between nations. Nations do not make presents to one another. They do borrow and they do lend, and the dislocations between the exports and imports, which are continually attracting attention, seem to me to be all due either to a change in the relations of borrowing or lending or to a change in the character of the services and goods rendered. For instance, we export to India every year a great number of prime young men. If their value were capitalised, as it would be if they were slaves, it would be several thousands of pounds apiece. We bring them back afterwards, if they come back at all, more or less shrivelled and worn out. Those are vast unreckoned exports. India complains that she sends us a tribute of goods for which we have given no return. We have given a return for many of them in the shape of men in the prime of life, who, on the whole, I think are very cheap for the purpose.

11,819. You have spoken in your evidence of the premium on bills, owing to a low exchange or a depreciating currency, as being paid by importers. Do you regard the Government of India as being an importer of services, and so having to pay the premium for remittances in common with other importers?—I am not quite sure whether I follow the first part of your question, but, taking the last part first, I regard the Indian Government as, in effect, the largest trader in the world; I think that its exports consist largely of services, and its imports consist of jute and hides, and so on, which it does not import directly, but takes when imported through the ordinary course of trade.

11,820. Would you say that it "imports" or "exports" jute, and so on?—I was then looking at the Indian Government as having its seat in England. It would be better, no doubt, to regard it as located in India, and exporting jute.

11,821. To that extent there is a competition between the Government and merchants who equally require to export those articles?—Yes.

11,822. Do you think that any difference would be introduced into that competition by a gold standard? —Yes, I think a great number of minor differences would be introduced. I do not think there would be any fundamental change. I think the greater fluidity of movements between India and the West in general, and England in particular, that would arise, would cause the fluctuations and disturbances to be more numerous, but less intense. A great number of causes which tend to produce certain effects do not produce those effects at all, if there is too great resistance. For instance, a certain thing may become cheaper in one place than in another, and that causes a tendency for it to go from the first place to the second; but, if the difference in the level of prices is not likely to last long, it does not move. Gold being more portable than silver—I understand that the charges are not much more than a quarter as much for a pound's worth of gold as they are for a pound's worth of silver, as between England and India—and the market that gold has, both for buying and selling in England, being so much freer and truer, and so much less liable to be worked against the individual dealer by powerful combinations of capital, it would seem to me that a great number of minor adjustments would go on with a gold currency in India, or even with a thoroughly well established gold standard, which do not take place without such gold currency or standard.

11,823. Would you regard the power of meeting those temporary disturbances—in other words, the demand for gold exports—as depending on banking facilities which would distribute the pressure over a longer period of time?—Speaking generally, yes.

11,824. I think you have spoken of exchange as being determined by the relative level of prices in India and abroad?—Yes. That is to say, that in my opinion the international distribution of the precious metals with open mints must be such that the gold and silver values of the different commodities bear the same relations to one another all over the world, allowance being made for transport; and that, if at any time any external change, such, for instance, as new American currency legislation, upsets that arrangement, then there will be a general shifting which will show itself through the exchanges; the exchanges not being the real active force, but the channel through which the real force acts; and after a time there will be a new settlement, and a new rate of exchange, and a new international level of prices.

11,825. With a gold standard, do you think the degree of pressure for gold would be partly determined by the rapidity with which Indian prices adjusted themselves to prices abroad?—Yes; very much so.

11,826. And what would be the immediate influence bearing on prices? Would it be a rise in the rate of discount? The export of gold would compete with other exports?—Yes.

11,827. And, so far as it went, it would tend to cause other exporters to lower their prices?—Yes.

11,828. An opinion has been expressed that a debtor country has a difficulty in retaining a precious metal in the absence of a protective tariff. The idea, I think, is that a protective tariff turns the balance of payments in its favour, and assists it in acquiring and retaining a precious metal. What importance do you attach to that theory?—It seems to me that the theory has some portion of a foundation in fact: that is, that there are two facts nearly corresponding to the statement, but not quite: but for the particular purposes for which it is used the statement is not, in my opinion, correct. There is no doubt, I think, that the immediate effect of the imposition by any country of protective duties, or rather high duties—I do not lay stress on their being protective—is to raise prices there—to make gold for a time a more eligible means of making payments than those goods which would have to pay this differential tariff, gold coming in free from such a tariff. If gold when it arrives is put away, as to a great extent it has been by Russia, that process may go on for a very long while. If Russia chose to prohibit all imports, except gold, and to put gold in store when it arrived, of course she could go on draining the rest of the world of gold. But, if the

Prof. A. Marshall.

16 Feb. 1899.

gold is allowed to go into the currency and act upon prices, that process can last only a very little while. When the gold has raised prices in the country, then, in spite of the heavy duty that is imposed upon other goods, other goods become as good cargoes to send to the country as gold would be. When the high level of prices that corresponds to a high import tariff has once been reached, then I am not able to see that that tariff is any protection to the stock of gold at all. It may seem as though it ought to be; one might expect it to be; but, when one comes to look at the reasons, I cannot see why it should be at all. The protective tariff has brought gold by making the country require more gold to do its business than before: the country has got the gold; there is again equilibrium, and I cannot see that without the tariff it would be more willing to give up the gold required to do its business at a normal level than with the tariff. While, on the other hand, it is, I believe, common ground to all parties, protectionists and free traders alike, that a high tariff, whether it is in the ultimate interests of the country or not, does diminish the volume of her foreign trade for the time. The consequence is that the feelers which that country throws out into all other countries are less numerous, and less elastic, and less widely diffused than under free trade. If, then, something or other, say, for instance, a discredit of that country's commerce arising in foreign markets, compels that country to pay unexpectedly part of its obligations, then gold would be likely to leave that country, as it would leave any other country under the same conditions. I think it would be even more likely, because there is always an easy market for gold. But an easy market for goods requires to be made beforehand; it is the product of years of trade; and, since the feelers that a protective country would have thrown out would be less than those which a free country would throw out, therefore it would be more difficult for that country to throw, say, 20 millions of pounds extra upon the world's markets without making a glut, and possibly even getting smaller returns in return for larger imports of goods. It would be more difficult, I think, then in the case of a protective country than in the case of a free trade country to meet unexpected foreign demands without exporting gold. On the whole, I conclude that once equilibrium has been reached, a protective tariff operates rather against the retention of gold than in favour of it.

11,829. You would, therefore, consider the fact of principal importance with regard to the command of gold to be that India produces a variety of exports for which the demand is world-wide?—Yes, and with organised feelers running out into various markets.

11,830. (*Mr. Campbell.*) On the question of exports and imports, did I understand you to say that a country could not export more than it imported unless it was sending away capital?—Except when it was sending away capital; allowance being of course made for the payment of its interest upon borrowed capital; and the trade being taken broadly, so as to include, for instance, the services which an English man of business resident in Calcutta renders to the country. His profits are, of course, the payments for his services, and they enter into the trade in that way.

11,831. But do you not think it possible that a surplus of exports might be invested in securities which would operate exactly in the same way as any other imports?—When one country invests in another country's securities, I call that lending to the other country.

11,832. So that a country might be exporting in excess of its imports without being unprosperous; in fact, it might be an evidence of prosperity?—I think one can never say that the excess of imports over exports is an evidence of prosperity or adversity until one knows the causes.

11,833. It might be?—It might happen to be caused by increased prosperity; but I do not think by itself it could be taken to be an evidence of either prosperity or adversity.

11,834. At question 11,787 you say that you consider 1*s.* 4*d.* "an equitable adjustment and one which "does not operate as a tax on trade." If the intrinsic value of the rupee in silver is 11*d.*, will not the lowering of rupee prices involved in its artificial enhancement to 1*s.* 4*d.* place the trade of India at a disadvantage with other countries whose currency is on an intrinsic silver basis?—It would put the trader, that is, the undertaker or *entrepreneur*, at a disadvantage: because, while he would sell his goods for the equivalent of the same amount of foreign goods as if there had been no currency disturbance, and while, therefore, he would be able to bring back a substantial real return for his exports, he would by the currency change be forced to keep a less quantity of that for himself and give more of it to his fellow men than he would have been able to do if the currency had not been appreciated. This is a most important social question; but I do not see that it has any connexion with foreign trade. To take the converse case, what happens when a currency is depreciated, is that a person who is under obligations to make certain currency payments (those obligations being in some cases fixed by definite contracts, in particular when he has already borrowed money at a definite rate of interest, but in other cases governed by custom), he is allowed through the change in the value of the currency to discharge those obligations at less cost to himself and less benefit to those who are engaged with him in trade. It seems to me, therefore, that the common opinion that a depreciating exchange is for the benefit of an export trade rests upon the natural habit of regarding the interests of the *entrepreneur*, the undertaker, as co-extensive with those of the trade. It has never been denied that a rise of prices or a fall in the value of currency is for the benefit of those who are undertaking the risks of speculation; but I conceive that it has never been shown that an *entrepreneur* gets a benefit from a fall in the value of the currency of his country, in consequence of his being engaged in foreign trade, which he would not get if he were not engaged in foreign trade.

11,835. He might get it in both cases?—He would get it in both cases, I think. Conversely, if the gold value of the currency were raised and prices lowered, as indicated in your last question, the employer would have to make heavier real disbursements out of the gross returns of his business.

11,836. Then would you not describe it as a tax on Indian trade from which other countries on a silver basis are relieved?—No, that is my point. I object to the use of the word "trade" there. In my view, the Indian export trade consists of three classes, speaking broadly. First, the undertaker of the risks, who is the person who figures most largely in the eye of the public; secondly, the people who supply that undertaker with such capital as he may want beyond his own, and, thirdly (and in my opinion by far the most important of all) his employés. I believe that the greatest harm is done, and the seeds of social discord are sown, if the interests of the export trade of a country are spoken of, when people have in mind only the interests of the *entrepreneur*, the undertaker.

11,837. (*Chairman.*) The interests of the capitalists?—Well, I would rather say the *entrepreneur*, because he may be borrowing capital.

11,838. It includes capital arising from two sources, his own capital or his borrowed capital. What you really are at, I take it, is capital and labour?—I wished to present the three classes of people.

11,839. The employé represents labour?—The employé represents labour; then there is the capitalist who is himself not engaged in the trade, but lends his capital.

11,840. That is capital?—That is part of capital. Then there is the third interest, that of the undertaker, the man of business, the employer who takes

the whole risks, and supplies nearly always some part of the capital.

11,841. I only want it to be clear that, where you say that there are three classes, and that the most important is the employé, you are thinking of what has been called throughout this inquiry "labour"?—Yes, provided that skilled labour be counted too; for instance, salaried managers and so forth.

11,842. (*Mr. Campbell.*) At Question 11,792 you say, "If the statement is that a depreciating currency "gives a bounty to the employer who is producing "for export, I admit it." But you add, "the bounty "is just the same, and at the expense of just the same "people, as that which he would get from a depre- "ciating currency if he were producing for his home "market, and not for export." And I think you go on to say that the bounty to the exporter is at the expense of the employés?—Of the employés, and possibly, to some extent, of the person who has lent capital to them.

11,843. But the fact that there is a bounty is not altered or done away with by the fact that the advantage is gained at the expense of the classes that you name; the fact of the bounty remains?—There is no doubt that it is a bounty, but the question is whether it is a bounty to the export trade. I say there is no bounty to the export trade, but there is a bounty to one class in the export trade at the expense of other classes in the export trade.

11,844. (*Chairman.*) That is, what one gains another loses?—That is my opinion; and the question whether these shiftings from one class to another are substantially equitable and in the interest of the country as a whole, or not, depends, in my opinion, as indicated in my first day's evidence, on the question whether the currency retains a constant value in terms of man's efforts. An increased purchasing power of the currency in terms of commodities seems to me a good thing if it corresponds to an increasing command over nature which man has obtained by improvements in production and transport.

11,845. In Sir Robert Giffen's letter to the "Times" of the 19th May last, it is stated that "by the necessity of the case the exchange is "chronically against India." What do you say to that?—I should have thought that, as India is on the balance an importer of precious metals, the tendency would have been the other way. It is commonly said that the exchange is against Australia, because she is naturally an exporter of gold. Of course, when you have two different currencies—gold and silver—it becomes a rather difficult question to say what you will take as your par of exchange; but still I cannot myself take the sentence in any sense in which I should agree with it. I think it is possible that Sir Robert Giffen meant something rather different from what I have taken him as meaning.

11,846. (*Mr. Le Marchant.*) I think the intention of the writer may have been to say that there was a large amount of fixed payments that India has to make—the home charges and so on—and, in addition, interest and dividends on railways and all the profits on foreign capital; and that, taking those requirements in the aggregate, it meant a pressure of payments against India?—That the balance of payments was against India. I think he may have meant that.

11,847. (*Chairman.*) I do not think that that exactly governs the case. For instance, take the remitting of money in respect of investments of capital in India. You pointed out this morning the enormous advantage to India of the importation of western capital to develop its resources. Now, if India gets its capital, India must export something to provide for the interest on that capital, and that is what some gentlemen are good enough to call a drain on the resources of India; in other words, if India gets 100,000,000*l.* which she has invested in railways, and she has to pay in London 5,000,000*l.* sterling, and that 100,000,000*l.* invested in railways in India produces, say, an income of 7,000,000*l.*, they call the remittance to London a drain on the resources of India?—Well, it is part of a stream—the stream on balance being one of benefit which India receives.

11,848. But you can hardly say that in that case the exchange would be chronically against India?—No, I think not. But I am always unwilling to express an opinion upon a sentence without seeing its context.

11,849. Now one other question. Who in India benefits, and who loses, temporarily or permanently by a fall of exchange? Who is the gainer and who is the loser?—I presume you are referring to a fall of exchange other than that which arises by the ordinary intercourse between any two countries from the deficiencies of exporters' bills.

11,850. No, I do not confine it to that?—Then I think one would want to take the cases separately. First, with regard to these variations in exchange between India and other countries which are of the same order as variations in exchange between England and France. With regard to these, a fall of exchange is generally an indication that a country has been importing overmuch; it is an indication that, to reduce the trade to a position of equilibrium, exporters are to push on and importers to hold back; it is for the time being a bounty on exporters and a penalty on importers. These fluctuations are not in themselves, I think, matters of any importance, nor do they in any way depend upon monetary arrangements. They depend on the movements of trade themselves. The movements of exchange are partly a method of clearly stating the temporary absence of adjustment between exports and imports (all reckoned in); and partly a method of indicating to those concerned a clear and definite channel by which they can help to re-adjust the mutual obligations between that country and other countries, and derive benefit to themselves in so doing. Then, secondly, we come to those fluctuations in exchange between silver-standard countries and gold-standard countries, which arise from a purely external cause, such, for instance, as the repeal of the Sherman Act. A fall in the Indian exchange, if it results from a fall in the purchasing power of the rupee, seems to me to give at once a bounty to every undertaker of risks, every person engaged in speculation in India; that is, every person who stands to gain by a rise in commodities relatively to currency. In so far as Indian prices up-country respond to the repeal of the Sherman Act, anybody engaged in manufacturing up-country for up-country demands would, I think, get that bounty, but the people with whom he was in contact would lose. He had borrowed, say, 1,000 rupees, and had to pay back say, 1,100 rupees; those rupees would be worth less to the person who got them than they would have been had it not been for the repeal of the Sherman Act, and that person would suffer. Indian employés, particularly as they would not be likely to possess an energetic trades union leader who could prompt them as to the right time to strike, would receive wages at the old rate in a currency which was worth less; and they would suffer. I do not think that a fall in the purchasing power of the rupee caused by external events, such as the repeal of the Sherman Act, would quickly spread up-country very far: but, so far as it does go, I think the results are as I have explained. In Calcutta I imagine that the undertakers of business risks concerned with the export trade are of several kinds, bankers, merchants, &c.; and that a great deal of the bounty would go to them, and that not nearly the whole of it would get to the grower of tea or jute, or whatever might be the product for exportation. Some, I think, would go to the merchant, some, perhaps, to other intermediary dealers, and some to the capitalist producer. Those who had lent money to all these would lose a little, in so far as they were not able to anticipate what was going to happen. The employés would, I think, lose a great deal. I wish again to lay stress on the fact that those who lend

Prof. A. Marshall.

16 Feb. 1899.

capital are not in so bad a position as those who supply labour; I have argued that history seems to show that they are able to anticipate changes in the purchasing power of money very much, and to accommodate the rate of interest which they charge to those changes, and so to prevent their bearing nearly as large a proportionate share of the burden as that which the unfortunate employés have to bear.

11,851. I suppose the greater portion of that reasoning would apply to a depreciated currency?—The whole of it in my opinion applies to a depreciated currency from whatever source the depreciation comes.

11,852. Is there anything further which you wish to state for the information of the Committee?—I should like to say a little more as to the fluctuations of the rate of discount; and as to the need that they should be softened and controlled by the maintenance of an adequate reserve of coin and notes in normal times, ready to be drawn upon in times of exceptional pressure. I am aware that these matters do not fall fully within the terms of this Committee. But as one side of the problem of Indian currency is being thoroughly investigated, the present seems to be a suitable occasion for inquiring whether violent fluctuations of discount are not an evil of the same order as those of exchange; and whether there is not a partial remedy for them, which would cost much less than it is worth to the community, but which is not easily to be attained by private effort without some aid and direction from Government. It seems to be established that the very high rates which prevailed early in 1898 were mainly due to exceptional causes, and not to the closing of the mints: that similar stringencies occurred before 1873 with a 2*s.* rupee, and afterwards with open mints and a fallen rupee. The fall in the gold value of the rupee is itself, I have already argued, one cause of the maintenance of a high *average* rate of discount. But, when we consider that this average rate has remained almost stationary in Calcutta during half a century, while it has fallen fast in almost every other great trading country, and in some countries has enabled enterprise to obtain the use of the necessary capital at little more than half the rates that prevailed fifty years ago, I think we must throw some part of the blame on the want of adequate provision for the fluctuating needs of Indian business. It is, of course, real capital alone that can provide the substantial force needed to make business prosperous. A supply of currency is but the flux that makes real capital fluid, and enables it to get at its work. And a mere permanent increase of currency does not make capital more fluid; it simply depreciates the currency. What is wanted is a currency which expands when business expands, and thus enables real capital to become fluid when it is wanted to be fluid; and which shrinks when business shrinks, and thus preserves itself from becoming superfluous and falling in value. By this means only can the currency retain its full power; and be ready by expanding again to supply the needful flux for business, when it again becomes exceptionally active. Foreign drains of bullion arising when there is no good stock available to meet them, give shocks to credit, which ought to be avoided. And any shock to credit, whether arising from within the country or from without, makes solvent traders as well as others need an unusual stock of currency to enable them to meet exceptional demands. The discussion of these matters in England, about eight years ago, in which Mr. Goschen took the leading part, resulted in the general adoption of the belief that a great commercial country was guilty of false economy, if it allowed the reserve of bullion and currency, which it keeps against such needs, to run too low. And the Directors of the Bank of England, aided by Lombard Street generally, have earned the gratitude of the country by increasing that ultimate reserve. The combined strength and elasticity which the currency of a country requires as provision against external and internal drains is most efficiently provided by a large reserve stock of bullion and coin. But this is expensive. And when, as appears to be the case in India, the drains to be guarded against are, in a large measure, internal, and dependent on the season of year, and therefore capable of being foreseen, it seems better to adopt the more economic provision of a moderate reserve stock of bullion and coin, combined with a limited and automatic elasticity of fiduciary paper currency. India's relative poverty makes it expedient that she should use the most economical of those devices which modern banking experience and science have shown to be at once effective and free from risk. But for this purpose the cooperation of Government is needed. And I wish respectfully to urge that the Government is not morally free to give the go-by to this question. By the terms of its existence, it is ever extending Western methods of public finance, and aiding the extension of Western methods of private business over the great continent of India. These powerful methods work for good; but because of their very power, they are apt to do much harm when they get out of gear. And therefore the Government, which promotes their extension, seems to me bound also to take thought how far India may require a parallel introduction of those powerful devices which the Western world finds necessary for grappling with occasional disorders of modern business and credit. I do not venture to urge any particular plan for the discharge of what seems to me the bounden duty of the Government in this matter. It must lie with those who know more of India, and more of the practical side of banking than I do, to decide whether there is the material in India for the formation of a bank corresponding to the Bank of England, or—which would probably be better for the special purpose—to one of the great continental banks; or whether a more direct route will be necessary for the present.

But this question leads me to wish to make a remark on one other subject, which lies perhaps rather far from the special business of the committee; but which has been brought home to me by contact with candidates for the Indian Civil Service. The nineteenth century is handing down to the twentieth a vast number of complex economic problems, which are occupying much, perhaps the greatest part, of the attention of the most thoughtful statesmen of the West. Western Governments are aided by the advice and criticism of a large number of able business men, not a few of whom have had time to consider the broader problems of economics, as well as the details of their special trades. There is every sign that the difficulty and urgency of these practical economic problems will grow during the twentieth century as fast in India as in any other country. And the Government of India cannot expect as great a volume of assistance from business men trained in high thought, as a great Western government can. For active life in India is short; it is interrupted by visits to Europe; the climate is hostile to severe mental toil after the day's work is done; and the number of able English business men in India who have an aptitude for high and hard thought in matters ranging beyond their own affairs, can never be very large. If India is to prosper, the difficult economic problems of her government must be solved mainly by the Government. But English officials in India have plenty of occupation for their strength in doing the day's work. And, if they have not learnt to separate the apparent from the real in the action of economic forces before they go to India, they can hardly learn to do so in India. It seems therefore urgently needed that some half dozen of the young men who go out to India every year, should take with them a good grounding in economics, and have already got to understand the main bearings of those modern economic forces which are revolutionizing the West, and are making great changes in the East. But under the present Regulations it is impossible for every candidate to make more than a rapid and superficial study of economics without gravely impairing his chance of being selected for service. I would like, even though it be not quite in proper season, to plead most earnestly for a change

in this respect. If, for instance, those who acquitted themselves with distinction in the paper on economics and economic history in the first part of the examination, were encouraged to present themselves for an advanced paper in economics in the second examination, they would be helped much on the way to becoming efficient administrators of Indian finance, and in later years wise counsellors.

Prof. A. Marshall.

16 Feb. 1899.

TWENTY-SEVENTH DAY.

Thursday, 12th January, 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR.

Sir JOHN MUIR, Bart.
Sir FRANCIS MOWATT, K.C.B.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. EVERARD HAMBRO.
Mr. W. H. HOLLAND.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

(*For Mr. Robert Barclay's evidence on this day, see page* 160, *above.*)

Statement of Mr. ALFRED DE ROTHSCHILD.

Mr. A. de Rothschild.

12 Jan. 1899.

The CHAIRMAN stated that Mr. Alfred de Rothschild was prevented by illness from being present this day, but on his behalf he read the following paper which Mr. de Rothschild, if present, would have read to the Committee:—

11,853. "In venturing to make a few observations in respect to the important and complex question of the Indian currency, I trust I may not be considered presumptuous. But, having had the honour of representing Her Majesty's Government at the Brussels Conference, where the question of the Indian exchange in connexion with silver played such a prominent part, I naturally take the greatest interest in the present controversy.

"It was at that time that the serious and continuous fall in silver had reached such proportions that it was evident the mints in India could not remain open indefinitely to the free coinage of that metal, and the scheme recommended by Lord Herschell's Committee, for preventing the rupee from following the downward tendency of silver, has certainly been so far successful that there is a distinct and very important difference between the relative values of the two, the rupee indeed having been maintained near the maximum proposed by that Committee for about the whole of the year 1898.

"But the fact that an important Committee has been named by Her Majesty's Government to examine into the Indian currency, is in itself a conclusive proof that the authorities in India are not satisfied that the scheme has placed the currency of the country on such a footing as to enable them to look to the future with perfect equanimity and satisfaction. The closing of the mints was in fact only the first and preliminary step towards the introduction of the gold standard; and, until the next and necessary steps are taken, the condition of the Indian currency must be a condition of transition, accompanied by the inconveniences which are inevitable while such a condition continues.

"Judging from the evidence which has been given before the Committee, I think that nearly all the witnesses are agreed as to the absolute undesirability of re-opening the mints, although in 1893 opinions differed very much as to the advisability of closing the mints; and I think I am also justified in saying, from the many suggestions made before the Committee, that the opinion in this country generally agrees with that of the Indian authorities, that the present state of affairs is not satisfactory.

"What is the exact position of the Indian currency at the present moment?

"The silver rupee, and the notes representing the rupee, are an unlimited legal tender. I might, therefore, perhaps describe the currency in India as being based on a silver standard, which must be abandoned, or an 'exchange' standard, which is not really a currency standard. I fail entirely to see how either a silver standard or an exchange standard can be transformed into a gold standard without the introduction of a certain amount of gold into the country, and without gold being recognised as legal tender.

"In fact a gold standard without a gold currency seems to me an utter impossibility, and, in this respect, I entirely agree with the evidence given by my brother, Lord Rothschild, as I do also on all the other points on which he has laid stress.

"But at the same time, I should like to see the idea of a gold standard and a gold currency take further development with reference to the embodiment of the idea in actual practice. How can the idea be most conveniently, cheaply, and rapidly realised? That is, to my mind, the really important and crucial question to be discussed as soon as it is recognised that the silver standard is a thing of the past, and is to be replaced by an effective gold standard. I cannot help thinking that an efficient plan might be devised for introducing into India the gold which is essential, in view to establishing and effectively maintaining a gold standard. The simpler such a plan is the better, and the more likely is it to command success. Essentially it should consist of arrangements for the establishment of a sufficient gold reserve as a beginning, and the free flow of gold into the country as well as out of it when need arises.

"But the detailed working of such a plan, simple as it is in its essence, requires a technical skill and adaptability which can hardly be looked for in a Government Department. It seems to me that, if a bank were created in India, with privileges similar to those held by the Bank of England, that desideratum would, in a very few years, be accomplished. The Bank might be constituted on the general lines which I now proceed to indicate.

Mr. A. de Rothschild.

12 Jan. 1899.

"*Proposed Bank to absorb the present Presidency Banks.*

"The capital to be the same as that of the Bank of England, namely, 14,000,000*l.*, and it would be a matter for consideration as to how much gold should be placed at once in the Issue Department, and as to how much should be invested out of the 14,000,000*l.* in Government Securities, &c., &c., against both of which the Bank would have the right to issue notes. But the question of the amount of capital is a matter for further and detailed consideration, with reference both to the efficiency of the Bank as a machine for maintaining the gold standard, and as a machine for earning dividends for the proprietors, and also as a machine for aiding in the development of trade and industry.

"The notes should bear their value stamped both in sterling and rupees, in the proportion of 15 rupees to 1*l.* But naturally the convertibility of rupees into gold would not be attempted all at once, nor would it be desirable to do so; but, even if absolute convertibility were declared, it could never take place on a very large scale, because, with such an enormous population as that of India, a very large amount of rupee currency would always be required.

"The Board should be as influential as possible, and composed of representatives of the chief merchants and bankers, the Government having the right to appoint its own representatives, as it is most desirable that the policy of the Government of India and that of the Bank should be in absolute harmony.

"The Government of India would, of course, use the Bank and its branches as its Treasury, which is the case at present with the Presidency banks, and, as regards the fusion of the latter into one large State bank, I think there ought to be no difficulty in bringing this about, especially if the new institution were prepared to offer very favourable and liberal terms.

"It has occurred to me that all silver imported into the country might be subjected to a heavier import duty (I do not, however, consider this as absolutely imperative), but, in the event of the number of silver rupees for currency purposes being deficient, and of its being felt that more are required, the Bank should have the sole right of buying silver duty free, all the silver bought being sent to the mint for coinage. Such coinage could be left in the hands of the Government, and would only be undertaken when actually ordered by the Government; but still, I cannot help thinking that the Bank should have some share in the profit on coining, the proportion of such share to be decided by the Government. This would facilitate the raising of the capital of the Bank, and would prove that the Bank had the Government's goodwill and support.

"But in making the suggestion of a silver import duty, I do so with a view of trying to make the intrinsic value of the rupee more nearly approximate to its token value; and, if I have mentioned the coining of silver rupees by the Bank of India, supposing it were formed, it is because at some future period there might not be a sufficient amount of currency in the country in connexion with the payment of wages for the moving of crops, or the payment of troops, &c., &c.; and this, in my opinion, has been the weak point in connexion with the closing of the mints in 1893, namely, that since then nothing has been done to augment the available currency of the country, the population of which has unquestionably increased, and demands, therefore, increased facilities for making payments. This is the necessary consequence of the period of transition, in which the Government have ceased to add silver to the currency and no gold has been substituted for the silver. I think, therefore, that, while it may be necessary from time to time to coin rupees, it must also be part of the scheme to make the sovereign legal tender, as suggested by Sir Edgar Vincent in his evidence before the Committee and as intended by the Government of India. This would also facilitate the operations of the Bank, one of the principal objects of which is to introduce gold into the country.

"I should like to emphasise (should a gold standard with a gold currency be suggested) that gold should be current in commercial centres and for international transactions, but not necessarily for all Native internal purposes; and, in support of this argument, if we assume that the new bank is formed, and it will have the custody of the Government balances (these, if I am not mistaken, amounting to about five crores of rupees monthly, *i.e.*, just sufficient to pay the India Council bills), no gold would be withdrawn by the Government for the interior, but only notes or silver.

"*Advantages of the Bank.*

"The advantages of a bank of this sort would be multifarious, amongst the principal ones being the following:—

"1. A large sum of gold would be immediately provided.

"2. This sum would be found by private enterprise and without recourse to a Government loan, thus avoiding a further heavy permanent charge upon the revenues of the country.

"3. By the establishment of the Bank, the machinery would be at once provided for the effective maintenance of a gold currency and for the conduct of operations connected therewith, which can be far better carried out by an institution of this description than by a governmental department, especially as regards the gradual accumulation of a further stock of gold.

"4. The maintenance of a steady rate of discount. Money could never be dear in the principal centres of India for more than a few hours, namely, the time occupied in the exchange of telegrams, because, if a million sterling were paid into the Bank of England (presuming the latter to be the agents of the Bank of India, which, no doubt, would be the case), the Bank of India, on being telegraphically advised, would at once have a right to issue 1,000,000*l.* in notes, or to give out gold certificates pending the arrival of the bullion itself. I am aware that telegraphic transfers of this kind can be made now through the agency of the Government; but, without convertibility, it is not certain that the money could be had back when required.

"5. The establishment of the Bank would tend to create confidence in the public mind as to the security and permanence of the currency system, and would consequently be effectively instrumental in directing to India the flow of capital which is so desirable for the increase of her prosperity.

"The fact of there now being in India about 100,000,000 acres of uncultivated soil ought alone to be sufficient inducement to attract any amount of British capital, which, I believe, would be at once forthcoming if the British investor knew that there was a fixed rate of exchange between the two countries.

"The Bank should not conduct any exchange transactions, but should confine itself (like the existing Presidency banks) exclusively to internal operations, and it would also, when necessary, make advances to the Indian Government against deficiency bills, which is frequently the case with the Bank of England.

"Considerable amounts of silver and gold go yearly to India, but what becomes exactly of these amounts it is difficult to say. Whatever may be their ultimate destination, it is a pity that the Government should not derive any benefit from them, which they certainly would do if a more substantial import duty on silver were established. In addition to this, a gold standard, if attempted, would materially contribute towards the shipments of gold which would naturally take the place of those of silver.

"I am aware that, in the opinion of some, India would soon lose her gold; but against such a contingency the new bank would have to act for the first few years with great discrimination, and would have to exercise its judgment as between the gold required for internal and genuine trade purposes, and that which would be required for exchange operations as being the cheapest mode of remittance. In fact, each case would have to be considered on its own merits.

"In cases of small amounts intended for internal purposes, these would be freely given; but, in the case of any large amount for transfer or export, then the advisability of raising the rate of discount would have to be considered by the Bank authorities, which is the case all over the world when State banks are called upon to protect their stock of gold.

"The Bank of France takes very stringent measures for the protection of its bullion, by immediately charging a premium; the Bank of Germany has likewise the means of placing impediments in the way of exports of bullion, and the Bank of England has the power to raise its price for eagles, bar gold, and all foreign coins, to a certain extent, but naturally not for sovereigns.

"But in the event of the Bank running short of gold, then I would suggest that the Government should come to the rescue to the extent of 10,000,000*l.* sterling, by buying one or two crores of rupees, and, according to competent authorities, what with the gold raised by the Bank, and this Government subsidy, there should be sufficient to face all eventualities for some time to come.

"At the same time, I know that no special legislation in respect to the currency of any country is sufficient in itself to bring about absolute prosperity. Such prosperity depends upon the country's trade, which consists of its imports and exports; but, if giving stability to the currency would tend to bring about confidence, then, in proportion to the confidence thus restored, fresh capital would be forthcoming, and the trade of the country would flourish and increase in the same ratio; and I cannot help thinking that this would be accomplished if a gold standard were introduced and if a relative value of 15 to 1 were established between the rupee and the sovereign. If I say a relative value of 15 to 1, it is because the majority of the witnesses are of opinion that this is the ratio which one should seek to maintain permanently, and it is approximately the ratio which now exists and seems likely to continue.

"After all, the financial position of a country in respect to its currency should be judged by its credit and its resources.

"As regards the former, the credit of India is second only to that of England, and, as regards the latter, the exports of India considerably exceed its imports, as is shown by the demand for Council drafts and the quantities of gold and silver annually sent into the country.

"It is estimated that there are in circulation four rupees to every inhabitant in India, the amount in circulation being 1,200,000,000; and if by the introduction of a gold standard, and taking the exchange at 1*s.* 4*d.*, the fact could be established that the British £ is worth 15 rupees, then it is equally true that 15 rupees would be worth 1*l.* In fact, my idea of a gold standard with a gold currency is where the note of a State bank inspires such confidence that it passes *pari passu* with coin, and I feel convinced that the notes of the Bank of India would very shortly command the same confidence as do those of the Bank of England.

"But in addition to the reasons to which I have briefly alluded above, there is one which has much greater weight with me than any other, namely, that all great countries have of late years adopted the gold standard, and in view of the fact that China is the only important country at present which is a buyer of silver, and then only on a limited scale, it may perhaps be said that the day has already come when India would find it difficult, if not impossible, to get rid of any appreciable amount of silver if she were anxious to sell on a large scale.

"Under these circumstances I should like to see the future profits made by the exporters of goods, as well as those made by the internal trade, represented by gold. A part of this gold would certainly leave the country if the balance of trade went against India, but if there were no gold to export, then the exchange would decline to a much greater extent, and the rupee would decline in value likewise.

"I am also fully aware that it has been suggested that a proposal for the creation of a great bank in India with certain privileges, and which would presumably do a very large and profitable business, might arouse opposition on the part of the great financial institutions both in India and in Europe; I doubt this, but in any case I feel certain that that opposition would be of very short duration, and that these institutions would be the first to lend their valuable aid and co-operation, which would be easily secured if their directors or managers figured on the board of the new bank. The world, in fact, is large enough for every one, and I am sure that the London Joint Stock Banks and private institutions do not suffer because there is a Bank of England, and on that score, therefore, I am quite confident.

"I have purposely not entered into statistics, nor alluded to any figures; these have been so fully gone into by the different witnesses before the Committee, that I feel it would be impossible to add to them, and even useless to allude to them.

"I have ventured to set out this very important question in a wide and general way, being convinced that what has been carried out successfully by other countries, far less powerful in every respect than India, not only might but ought to be attempted in that country, and that we in England ought to lend our co-operation in the settlement of the currency question of a country with which we have such intimate relations, commercially and politically.

"Of course, where an experiment is made, it is impossible to speak with certainty as to its results; but it seems to me that this would be an experiment attended with a minimum of risk.

"The more advanced the principles in connexion with the currency of a country, the more they emphasise the civilization which exists; and, as India is England and England is India, I, for my own part, have every confidence and belief that a gold standard might be introduced, and have no doubt but that, in the course of time, the British £ would be accepted in India, in the character of full legal tender, as readily as in other parts of the Queen's dominions."

[Adjourned.]

TWENTY-EIGHTH DAY.

Wednesday, 15th February, 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR.

THE LORD BALFOUR OF BURLEIGH.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
MR. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

Mr. W. Duncan.

15 Feb. 1899.

Mr. WALTER DUNCAN called and examined.

11,854. (*Chairman*). You are Mr. Walter Duncan, of the firm of Walter Duncan and Co., of Glasgow, East India merchants?—Yes, the senior partner, and also of Duncan Brothers and Co., Calcutta.

11,855. Have you been engaged in the Indian trade for a long time?—It is rather more than 40 years since I arrived in Calcutta to establish a business which remains to this day.

11,856. How long were you in India?—I was 10 years resident there, and I have been connected with India ever since.

11,857. Since then you have resided in Glasgow?—Yes, I have only paid one visit to India of six months' duration.

11,858. Then you have had a very wide experience of Indian trade?—Yes, I have had a fair experience.

11,859. Now you remember the closing of the mints?—Yes.

11,860. Will you tell us whether you approved or disapproved of that measure?—I thought it was a mistake; I disapproved of it.

11,861. Will you give us your reasons?—I think it is better in the interests of India that the exchange should remain at the natural level instead of being appreciated by any artificial arrangement.

11,862. You are aware of the financial position of India at the time when the mints were closed?—Yes, and I sympathised most fully with the difficulties of the Government of India.

11,863. In your opinion what has been the effect on the trade and production of India of the closing of the mints? The experiment has been in force now, say, for six years. Will you tell us what you think has been the effect on the trade of India?—I think the full effect has not yet shown itself, because these natural laws work very slowly, though they work very surely, towards their end. It is always a difficult thing for a merchant to analyse the causes that produce a given state of things at any moment. It is his duty to try to do it, but there are so many influences working in different directions that it is a difficult duty. But I cannot get over the conviction that the closing of the mints, and so raising the rupee, tends to burden and must burden the exports of India, which is the interest of the great bulk of the population.

11,864. Will you just explain to us how that works out? In the first place, have prices risen or fallen?—Well, that is a very wide question, and it is not easy to give a single answer to it. There are many things the prices of which one can scarcely say have risen, there are are other things the prices of which have clearly risen, but it seems to me that on the whole—I am speaking over a broad period—for a long time there has been very little change in prices in India. I think any difference is due rather to a change in the commodity itself than to change in the standard of value.

11,865. Do you mean the supply has been insufficient for the demand, and that therefore prices have risen?—Prices have not much risen; that is my belief.

11,866. Then it would not be in the article itself?—But where there have been changes, I say it is due rather to seasons, for example, affecting the article itself than to any change in the standard of value in which the price of the article is measured.

11,867. Then am I to understand that, irrespective of the changes arising from the excess of supply, or the deficiency of supply, in the article itself, prices have been unaffected by the exchange?—They seem to have been very steady. The striking thing has been that silver has been such a good standard for India. I think it is rather a better standard of value for commodities in India than gold has been in England.

11,868. How has the price of silver run during the past six years—or rather the value of silver?—If you say the *value* of silver, then you raise the question of commodities again.

11,869. The price of silver?—The price of silver declined after the mints were closed, but it has risen since. It was down, I think, to 24*d.*, and it is 27½*d.* now.

11,870. Now, about the effect of the steady rise of exchange that there has been. There has been a steady rise of exchange, has there not?—Yes, for the last two years. For some time after the closing of the mints exchange fell.

11,871. For some time exchange fell, and then it began to rise, and it has risen pretty uniformly since?—That is so.

11,872. If the mints had remained open and exchange had still further fallen, what do you think would have been the effect on prices then?—I am not sure that prices would have been very different from what they are if exchange had fallen to 11*d.*, as probably it would have done.

11,873. I rather thought you held the opinion that higher prices would have ruled?—In course of time they would.

11,874. But not by now?—Possibly they would.

11,875. Who would have gained the advantage of those higher prices?—The producer of the commodities which are exported from India.

11,876. Do you not think that higher prices would have affected the cost of production?—It would have encouraged production.

11,877. That is not the point. Your argument, if I understand it correctly, is this: that the price becoming higher and the cost of production remaining the same, there would have been a larger margin of profit, which would have been to the benefit of the cultivator?—That is my view.

11,878. But do you not think it possible that the cost of production might have risen?—It is likely that the prosperity would have diffused itself through the whole community, and that the labourer would have got his share. I think that would come infallibly.

11,879. Have you any opinion as to how far the advantages consequent on a rise in prices would be neutralised by increased taxation?—I am not quite sure that I follow your question.

11,880. Take some of the instances you have given here. Take first what you have said with reference to cotton goods?—I think the right way for a Government to pay its way is to impose import duties. I look to the great example of England in that matter. I have put down here figures which would make up a revenue of Rx. 5,000,000, the amount that would be required if the 1*s.* 4*d.* exchange were reduced to a 1*s.* 1½*d.* exchange, or some say 1*s.* 2*d.* I prefer to say 1*s.* 1½*d.*, for this reason, that I take that figure to be the middle figure betwixt 11*d.* and 1*s.* 4*d.* Now, I give an analogy that I think will explain what I mean. If I had been raised 20 feet above the ground, and had only one way of getting down, namely, by dropping the 20 feet, I should expect some calamity—I should expect broken limbs. But, if any kind friend interposed a platform half way between me and the ground, I should have to drop only 10 feet at a time and so reach *terra firma* safely.

11,881. As I understand, you put the limit of fall at 1*s.* 1½*d.*?—That is so.

11,882. On what ground do you base that?—Because we have an artificial state of things out of which I think it is desirable that we should get in the wisest way.

11,883. The wisest way, if I understand you correctly, is that the rupee should be at its bullion value, and, of course, that the exchange should be affected accordingly?—Ultimately, but I mean only 1*s.* 1½*d.* in the meantime.

11,884. We are not dealing now with the meantime; we have to deal with the thing permanently. Now, suppose the mints were open, and that the silver value of the rupee went down to 10*d.*?—It is more than 10*d.* just now; it is rather over 10½*d.*, and I expect that with open mints it would not go lower but would rather go higher, and I have put figures down here to show that.

11,885. The point of your evidence is this, that a 1*s.* 1½*d.* rate is better than a 1*s.* 4*d.* rate for the trade of India?—That is so.

11,886. Why?—Because I think the chief consideration is India's interest as a producing country. If we put a burden on the production of India, India cannot prosper, and no interest in it can prosper. If India is prosperous, everybody concerned in the trade of India will be prosperous, because the people of India will be able to purchase what in their poverty they could not pay for. I will try to give you an illustration of how it tells. It is the producers who are the real exporters of produce from India, and with a low exchange they get so many more rupees. No doubt you will say that, if exchange were to fall, that would cheapen the gold price, and therefore tend to reduce the gold price in this country. That is quite true, but India is not the only producer of these articles; other countries produce them, and she is competing with other countries. We could compete favourably with exchange at the natural level, or, I believe, at something above it; but it would be hopeless to compete if the exports of India had to bear a 1*s.* 4*d.* rate of exchange, while others were competing on the privileged level of 10½*d.*

11,887. What have they had to bear on an average for the last 30 years?—There has been a much higher rate of exchange, but never an *appreciated* rate of exchange. I do not want a low rate of exchange. The *artificially* appreciated rate of exchange puts us at a disadvantage with silver-using countries. That is the serious consideration.

11,888. It puts India at a disadvantage with silver-using countries?—That is so.

11,889. Do you know the extent of the trade of India with silver-using countries?—But I mean in competing with other silver-using countries, though she may not be doing business directly with them.

11,890. Do you know that nearly 80 per cent. of the trade of India is with gold-using countries?—I am aware that that is so.

11,891. Would not that form one of the reasons upon which you ought to base your opinion?—It is with that knowledge that I have formed the opinion which I have expressed to you.

11,892. Then you think the prosperity of the trade of India dates back from the time when silver fell?—I would not say that. India was quite a prosperous country before silver fell, and I never had any desire that silver should fall.

11,893. Then will you tell me where the burden is? You say that a 1*s.* 4*d.* rate now would be a burden on the exports of India. I want to know whether that 1*s.* 4*d.* rate, or a 1*s.* 6*d.* rate, or even the 1*s.* 9*d.* rate which prevailed years ago, was a burden?—That was no burden, because it was the natural level, and the same as in other silver-using countries.

11,894. You said that before, but I want you to explain what you mean by that?—I mean, India competes with other countries; it competes with China, for instance. China will be remaining on a 10½*d.* level, or, even taking copper cash into account, 10 or 15 per cent. above that—say on a 1*s.* level—whereas we are working at 1*s.* 4*d.*

11,895. (*Lord Balfour of Burleigh.*) Do I understand that the use of the word "burden" in your answer means this, that, as compared with what would be the natural value of silver—take it for the moment at 11½*d.* or 1*s.*—the expression "burden," in your mind, is intended to imply the difference between the 11½*d.*, or the 1*s.*, and the 1*s.* 4*d.* which is the exchange at the moment?—That is so. I say India has to carry a burden from which China, a competing country, is altogether free. That is my point.

11,896. (*Chairman.*) Your argument really is now based on the Chinese competition?—Mainly, not solely.

11,897. Assuming China out of the way?—Then something would still remain.

11,898. But it would be very little?—Certainly it would be less.

11,899. With your experience in the Indian trade, will you tell us where and to what extent China is in competition with India now?—Well, it is not so much in competition with India, so far as tea is concerned, as it used to be; in point of fact, Chinese tea is pretty well driven out of the market; but we cannot leave out of view the events that have recently occurred in China. I think in all probability China will be a field for European capital and enterprise in the future which it has not been in the past.

11,900. What I want to see is where India has been in competition with China, and where it has been disadvantaged owing to a high rate of exchange, or take it on the silver basis, or in any way you like?—I have given as an illustration the case of opium. The Indian Government itself is a producer of opium on the Bengal side. Now in 1896 they sold 39,000 chests for a gross sum of Rs. 51,165,550. In 1897 they sold the very same quantity, which realised only Rs. 40,901,985, being Rs. 10,263,565 less, due to a difference in exchange.

11,901. Is there an effective competition now between Bombay and, say, any great Chinese place in the production of cotton or cotton goods in which the Indian market is at a disadvantage owing to the rise in exchange, or rather where China is at an advantage as against India, owing to the rise in exchange?—I think there has not been time for the competition to be effective; but there is a real hope that it will be; and I understand, from the manager of a large steam

Mr W. Duncan.

15 Feb. 1899.

shipping company here that they have been carrying out machinery for years past in very large quantities to China. I understand further that building lots fronting the Shanghai river have risen very much in price, just for mills to be erected there.

11,902. All this is speculation as to the future?—It is a fact as to the machinery going out there.

11,903. And it is also a fact, is it not, that some of the Chinese mills have come to grief?—I do not know that. I know one was burnt that was not insured.

11,904. Do you know anything of the internal taxation of China?—I do not.

11,905. It is very different, I suppose you know, from the internal taxation of India?—No doubt.

11,906. And again, there is no coinage in China, in the proper sense of the word?—I do not know about that. I know that there is copper cash in use, and that it costs more than silver at the present price, so that there is a tax there to some extent.

11,907. I understand your opinion is that, supposing the mints were opened and exchange fell, and therefore there was an increase of taxation required in order to remit the gold to London for the payments that India has to make in gold, the best way to meet that would be by an increase of taxation?—Yes.

11,908. You say you are in favour of import duties?—Yes. Take the example of England, which it is well to consider; I think everyone knows and acknowledges that imports are the proper subject for taxation and exports are not.

11,909. Who pays the tax on imports?—The consumer. Let us take an example of these two things—tea and whisky. Whisky is produced in Scotland in very large quantities, as we know; yet the Government does not put a single penny of taxation on it as *a product*. They do tax it as an article that is *consumed* but not as *a product*; it is sent away perfectly free to the ends of the earth, whereas tea is an article produced in India and Ceylon chiefly; it is burdened with an import duty equal to 50 per cent. at least of its value. I ask would the moral sense of this great country not recoil against an incongruity of that kind if the question were not dominated by purely economic considerations.

11,910. The economical consideration is this, that the consumer is taxed?—Well, it is a wise thing to tax consumption because that rather leads to economy, and economy itself is a good thing. It is a bad thing to tax production, because that discourages the creation of wealth, and that is a bad thing.

11,911. That is rather outside what I was asking you just now. I asked you who would pay the increased taxation which you propose to impose upon India, and you said the consumer?—That is so.

11,912. Let me draw your attention to the resolution which you seconded at the Glasgow Chamber of Commerce in October last. That resolution is this: "That the true interests of India will best be attained "by a return, as circumstances may permit, to a "re-opening of the mints"?—Substantially so.

11,913. Is that the view of your Chamber?—It is not the view of the Chamber; our Chamber is very much divided on that question; but it is the view, I think, of those who have experience of India, Mr. Donald Graham, and others.

11,914. Now, do you think that opening the mints at once would cause widespread disaster to merchants and traders, and grave difficulty to the Government of India?—I think so.

11,915. Will you tell us very shortly the plan which you would recommend to the Committee in order to avoid that widespread disaster?—I think the Government of India could come, with perfect safety to itself, to a point midway betwixt, say, 1*s.* 4*d.* and 11*d.*, which is what I call the natural rate of exchange.

11,916. How would you proceed as to opening the mints?—I would keep the mints closed, and let the Government aim at 1*s.* 1½*d.* instead of 1*s.* 4*d.*

11,917. (*Mr. Campbell.*) You mean closed to the public?—Yes, that is all we mean when we talk of the mints being closed—simply closed to the public.

11,918. (*Chairman.*) But, as I understood, the resolution which you seconded at the Glasgow Chamber of Commerce asserted that the true interests of India require the re-opening of the mints?—Ultimately, yes, and I think so, too.

11,919. Ultimately, it would come to that?—Yes.

11,920. I want you to tell us how you would arrive at that?—I think that the future may bring us a great deal that we do not know of just now. I point in my paper here to what I think is a very striking fact, the growing disparity between the value of silver and the value of gold produced year by year. So recently as 1890 the value of silver produced in relation to the value of gold was as 108 is to 100. This last year we have not got the returns of silver, but we have got the returns of gold. Assuming that silver, which has been a diminishing quantity, is in 1898 the same as it was in 1897, the proportion instead of being as 108 is to 100, will be as 29 is to 100. I think that is a very important and weighty fact tending to give us some conception that silver has reached bottom, has passed it, and is now much more likely to rise in relation to gold than to fall. But, when we speak of the future, one must always speak with reserve and with modesty.

11,921. Your opinion is that the mints for the present should remain closed, but that the rate of exchange which, of course, using your own language, will be an artificial rate, should be 1*s.* 1½*d.*?—That is so. I think we must consider the present state of things, while cherishing the hope of our ideal.

11,922. Now, judging from the experience of the past year, do you think that the maintenance of the rupee at 1*s.* 4*d.* is compatible with prosperous trade?—I think it will seriously injure trade. I have some figures here; they are not at first hand, but they were taken from the "Home and Colonial Mail." I can give the imports and exports, but the balance of trade is perhaps the important thing. In 1895–96 it was Rx. 38,820,000. Next year it had fallen to Rx. 23,850,000 and last year 1897–98 it had fallen to Rx. 14,775,000. I think that is a very striking fact, assuming it to be a fact.

11,923. Do you consider the trade of India to be prosperous just now?—I do not think it is prosperous just now. The jute mills have just agreed upon short time, to come into effect from the 1st April. The imports of cotton goods during the last four years were as follows:—In 1894–95, Rx. 32,673,000; next year, Rx. 25,756,000; the next year, Rx. 29,750,000; and in 1897–98, Rx. 26,395,000. I do not, for a moment, suggest that all that is due to the appreciated rupee; we have had famine and other considerations to take into account; but what I always say is this, the most difficult thing that any merchant who tries to be fair with himself has to do is to analyse causes.

11,924. The famine would be a disturbing element?—No doubt it would contribute its share.

11,925. And probably the increased production of cotton goods in India would be a disturbing element?—Quite likely, but the imports of other merchandise show an increase in these years, whereas cotton goods show a decrease.

11,926. But taking the trade of India, as a whole, do you think it is decreasing?—The imports, as a whole, have not decreased in the last four years, they have rather increased, but the exports have decreased. Taking these figures, as I say again, to be authentic, the exports in 1895–96 were Rx. 118,000,000——

11,927. We have all the figures before us; I do not think you need go into that?—Very well.

11,928. (*Lord Balfour of Burleigh.*) What are the considerations which lead you to fix upon 1*s.* 1½*d.* as your favourite rate of exchange?—My conviction,

which I hold with all deference to the views of others, is that we shall never be right until we have returned to open mints; but we are in an artificial state of things just now, and we must consider the position. To return immediately to open mints would, I think, produce disaster to merchants and traders, and grave difficulty to the Government of India.

11,929. Do I understand that you would return at once to 1*s.* 1½*d.*?—Yes, and I have shown how the Government could easily pay its way if that were done.

11,930. Why do you take 1*s.* 1½*d.* as the rate?—Because it is the middle betwixt 11*d.* and 1*s.* 4*d.*, and it is easier to proceed by two steps than by one, easier and safer.

11,931. Your ultimate idea is to get back to open mints, utterly irrespective of how high or low silver may go?—I have faith in the future of silver.

11,932. But suppose your faith should be not well placed—it is a very speculative subject; new silver mines may be discovered, and so forth, and it is not beyond the bounds of possiblity that silver may go very much lower than it has?—I think it is beyond the bounds of possibility. That is my opinion.

11,933. Why?—Because everything that can tell against silver has been telling for years past, and the result has been not a lower price for silver but a higher. If we were to open the mints it would create an increased demand. China has got a very great future; so has Africa; and both need silver.

11,934. But, after all, the real factor in the value of silver will be its cost of production?—Yes, that is so with all commodities—and demand and supply.

11,935. Do you know what is the cost of production of silver now under favourable circumstance in the best mines?—I have heard it stated as low as 1*s.* 8*d.*, but that is exceptional, and I think that would no more regulate the price of silver than the salmon that leaps into the fisherman's boat and costs him nothing affects the price of salmon, to use an illustration with which we are all familiar in economic writings.

11,936. So the policy that you advocate obviously does hinge entirely on the future of silver?—Yes, and I think everything warrants our anticipating a reasonable price of silver. Everything has been against silver for years past, and yet silver has risen.

11,937. Suppose America were to cease the purchase of silver in order to coin silver; would that have a bad effect?—No doubt. But you know our Scotch proverb usually given in answer to suppositional questions: "If the lift should fa' it would "smore the laverocks," which in English is, "If the "heavens should fall the larks would be smothered," and yet they sing.

11,938. Do you consider it as improbable that America will give up buying silver and coining it as that the heavens will fall?—Oh, I do not say that.

11,939. Then you would not press your proverbial analogy too far?—No, but it illustrates the difficulty of dealing with hypothetical questions.

11,940. (*Mr. Campbell.*) With regard to the competition of China or other silver-using countries with India, you do not suggest, do you, that it is only in competition with these countries that the question of exchange tells?—No, it tells quite as much in the South American markets—Argentina for example.

11,941. You think the rate of exchange affects India's trade and competition with gold-using countries to a certain extent?—Yes.

11,942. For instance, in regard to the supply of wheat to the English market. At a low rate of exchange India might be able to outbid America, whereas, if the rate were raised, it might give America the advantage?—Quite so. India could not compete effectively at the price.

11,943. Therefore, it is not only with silver-using countries that this question of exchange tells, but in competition with gold using countries also?—That is so; all other countries that produce similar commodities.

11,944. You say in your paper that you hold that it is no part of the functions of Government to regulate the volume of currency?—What I mean by that is that, if a Government enter upon that course, it enters upon a very injurious policy. I do not want to put it in any offensive language, but that is what I mean, and I am not aware that any Government has tried to raise exchange by doing that.

11,945. You think that the regulation of the volume of currency should be left to the operation of trade influences?—That is my view entirely.

11,946. Then, taking the question of the ratio, whether it is 1*s.* 4*d.* or 1*s.* 2*d.* or 1*s.* 1½*d.*, would you say that whatever ratio was fixed upon should be one that would permit of gold coming to India freely and automatically and without artificial assistance?—Of course, so long as the rupee is appreciated we cannot say it is relieved from all discouragements, but I do think that at, say, 1*s.* 1½*d.* it is much more likely to come. The argument is often used that, if exchange were steady, gold would go to India; but it seems to me that English gold will go out there only if it can find profitable investment; and my belief is that an appreciated exchange puts such a tax upon exports of every kind, whether they be the produce of the soil or the products of modern machinery, that you would not have prosperous undertakings in India.

11,947. Then you suggest that in addition to offering 17 rupees for the sovereign the Government should also have the power to coin rupees themselves?—That is so.

11,948. But to the extent to which gold came in as currency at 17 rupees to the sovereign, the currency would be to that extent replenished, and the need for coining rupees would be correspondingly reduced?—That is so, and therefore I fall back on providing a budget from taxation.

11,949. Would you admit that there are any objections to allowing the Government to make a profit out of the coinage by turning out a rupee worth 1*s.* 2*d.* or 1*s.* 4*d.* out of 10*d.* or 11*d.* worth of silver?—I cannot regard the principle as sound, but it is much more pardonable to do it at 1*s.* 1½*d.* or 1*s.* 2*d.* than at 1*s.* 4*d.* The Government just now are relieving the burden that falls on them by raising exchange to 1*s.* 4*d.* I say you cannot create wealth by a financial device. You can shift the burden from one interest on to another. By raising the rate of exchange to 1*s.* 4*d.* the Government is relieved to a certain extent, and imports get a certain bonus, but both of these forms of relief must rest somewhere, and they fall upon exports, which I say is the very last thing that should be taxed; quoting the example of England again in justification of that remark.

11,950. With regard to this power of coining, do you think it would be right to give the Government full discretion, or that there should be certain restrictions imposed to prevent the possibility of over-issues?—I am not sure that I have considered that question sufficiently to give evidence of any value; but I quite see this, that, if the rupee be appreciated in that way, it is open to abuse the same as paper currency is open to abuse.

11,951. Speaking generally, you recognise the necessity of some check?—Yes, I think it would be advisable.

11,952. Now, taking 11*d.* as the intrinsic value of the rupee, I think you hold that the difference between that and the Government rate of 1*s.* 4*d.* operates to that extent as a tax upon exports, while at the same time it operates to the same extent as a bounty on imports?—That is my view.

11,953. And you would propose to equalise that to some extent by reducing the rate to 1*s.* 1½*d.* and raising the import duties to 10 per cent.?—I would.

11,954. You think an arrangement of that kind would be in no way unfair towards imports?—Very far from it. Even then I think imports would still get a bonus. The Manchester interest is a great interest;

Mr. W. Duncan.

15 Feb. 1899.

it deserves to be considered and will be considered. But Manchester manufacturers who want open mints could desire nothing more than free imports. Now a piece of shirting costing, let us say, 5*s.* with exchange at 11*d.* would cost 5 rupees 7 annas 3 pies free of duty, whereas with mints closed to the public and exchange at 1*s.* 1½*d.*, even though that 5*s.* were taxed to the extent of 10 per cent. and made 5*s.* 6*d.*, the cost in rupees would be only 4 rupees 14 annas. Therefore there is still a bonus to imports.

11,955. There is still a bonus to the imports after making the adjustment you speak of?—That is so; a bonus of over 9 annas on every 5*s.*

11,956. Now, if a suitable ratio were adopted at which currency would flow into the country, what effect do you think that would have on the country's prosperity?—I am quite sure that exports would receive a great stimulus. The producers, who number 180 millions, would prosper, and therefore imports would certainly prosper as well, and the indirect gain to the Government would be very great from railways and otherwise.

11,957. Do you think that the revenue would expand under those circumstances?—I think the revenue would expand certainly, because the area of cultivation would be increased and rents would rise—slowly, but surely.

11,958. You think the revenue might expand sufficiently to enable the additional taxation you suggest to be dispensed with?—I think that is quite a reasonable expectation.

11,959. (*Sir C. Crosthwaite.*) You say that the method adopted by the Indian Government has been to close the mints and restrict the currency. What is the object of the Indian Government? Is it merely to restrict the currency or have they any further object?—That is a step towards a further end—to raise the rate of exchange, and so save them the loss on their remittances.

11,960. Is that the object with which the mints were closed?—I so understood.

11,961. Was it not to introduce a gold standard?—I believe it was.

11,962. Was not that the avowed object—the very purpose for which the thing was done—to lead to the introduction of a gold standard?—Then it was a step to something else. Ultimately it was to relieve the Government from the burden of meeting the 16,000,000*l.* or 18,000,000*l.* sterling in this country.

11,963. But the object was to introduce a gold standard?—Quite so. My evidence can be of no value as to that, but I admit that, as you put it to me.

11,964. When you say that there is no precedent for such a step, do you know of any other method by which a gold standard can be introduced into a silver standard country, except by the preliminary step of closing the mints to silver?—But 15 rupees to the sovereign is no necessary condition of a gold standard. It might as well be 18 or 20.

11,965. The radical distinction between you and the Government of India is that the Government of India aim at a gold standard, and you would have no gold standard at all?—That is so.

11,966. You have laid stress on the fall in the price of opium. Have you examined the latest statistics of opium sales?—I have not the latest statistics before me.

11,967. Are you aware that the price of opium has risen considerably since last December?—I am not aware of that. I have no knowledge on that subject.

11,968. (*Mr. Le Marchant.*) You allude to the price of opium being very low in the year 1897. Have you observed whether it has been as low, or even lower, in past years?—I think not so low in past years—never so low in past years, so far as my recollection goes.

11,969. Not even when the mints were open?—Not when the mints were open. I am not speaking of the price just now so much as the aggregate value.

11,970. How far would the aggregate value depend on the quantity of the crop that had to be sold?—I know that the Bengal Government used to sell 55,000 chests in former years; it has been a declining trade; it has always been an uncertain trade. I remember very well when Mr. Wilson came out in 1860 that he deprecated much reliance being placed on the opium trade. He thought that it was a trade that would diminish, and, perhaps, disappear ultimately.

11,971. In your notes you speak of the same amount of chests being sold in 1897 as in 1896, but realising in 1897 Rs. 10,000,000 less than in 1896. You attribute that difference to the rate of exchange?—Yes, the price in China being the same, the difference in exchange would account for it.

11,972. The price in China you look upon as a fixed quantity?—Not necessarily; only as a merchant I observe this; the closer you come to the consumer the more difficult it is to raise prices.

11,973. But the consumer's power of purchasing may be affected by a good many circumstances?—That is so.

11,974. You allude in your notes to the introduction of the precious metals as having formerly diffused wealth. Do you regard silver as having come in for ordinary commodity uses or solely for currency purposes?—For both.

11,975. Should you say one more than the other?—It used to be about 8,000,000*l.* sterling of silver that was introduced annually into India (I am speaking from memory), and it was understood that about half of that was coined into rupees, the rest being taken for other purposes.

11,976. Do you think that the bulk of what was coined in rupees was added to the currency?—In the first instance, but then a great deal was taken from the currency for manufacturing purposes, because with the stamp upon it it was a guarantee that it was silver of acknowledged purity.

11,977. Would you regard the amount of silver that came in in that way as a test of prosperity?—It speaks to the balance of trade.

11,978. May it not speak to a preference for taking silver rather than other commodities?—No doubt, but then silver is the form in which the surplus wealth is kept. A man does not buy two needless *dhooties;* he rather puts his surplus into coin. It is after all his common needs are met that he would lay by his surplus wealth, and in that form.

11,979. If other imports are now being taken in greater proportion, would that not show that the country had a preference for other forms of commodities instead of silver?—I do not know to what period you refer.

11,980. I think you say the higher exchange tended to cause a larger importation of commodities generally?—It helps; it cheapens the rupee price.

11,981. Then would you regard the result as being worse for India than if India took silver?—I would not regard it as being worse.

11,982. You say: "Despite the supposed advantage to imports of an appreciated rupee, the trade in cotton yarns and piece goods shows no increase, but rather marks a decline"?—Yes, I have given figures already to that effect.

11,983. Is that an exception to what you regard as the general rule?—Increase is the natural thing to look for. When I went to India, 40 years ago, Calcutta imported 25 millions or 26 millions, or at the most 28 millions of yards monthly. She now imports 90 millions; but we know that the population has increased. Sir Robert Giffen has given us the facts in his lecture, which appears in the *Times* this morning, of the great increase of population, and therefore the trade ought to expand correspondingly.

11,984. But you would say that this trade does not increase in the same proportion?—I am speaking of the last few years; but then I do not assign that to any one cause. I say there is more than one cause. Let me explain that we have had famine and troubles of various kinds, and very likely these have had their influence.

11,985. Do you think that the local manufactures in India would have had something to do with that, the out-turn of the Bombay mills, for instance?—No doubt that is so.

11,986. But putting those particular commodities aside, would you say that imports had been increased by the closure of the mints as a matter of fact?—There, again, my difficulty is to analyse the causes that produce the effect which we acknowledge. I wish to speak with great reserve, because I know the difficulty as a merchant who has had in the course of his life to analyse causes. There are currents in this direction and currents in that direction.

11,987. (*Chairman.*) Cross currents?—Cross currents; and he is not a wise man who jumps to a conclusion in matters of that kind. But what discourages exports cannot be good for imports in the long run.

11,988. (*Mr. Le Marchant.*) I thought from your singling out these two particular articles that you viewed them as an exception to the general rule that imports would be increased?—Cotton piece goods are the largest single article, and therefore I selected them.

11,989. But you find, as a matter of fact, they do not increase?—The last few years they have not increased; but, if you go far enough back, you find they have increased wonderfully. As I say, when I went to India the first time, and found 28 million yards coming out in one month—it was too much; now we find 90 million yards imported in a month.

11,990. I wish to arrive at what conclusion you draw from the facts which you mention in this paragraph?—What is in my mind is this, that raising the rate of exchange does *directly* favour imports, and does *directly* burden exports; but, inasmuch as imports must in the long run be paid for through exports, the serious question remains. If the exports are burdened the country cannot prosper, and if it does not prosper it cannot afford to pay so freely for piece goods or anything else.

11,991. And you consider that the reason India is not taking piece goods in larger quantities is from this hampering of exports?—There again, I must just repeat what I said. I acknowledge there have been experiences in the last few years, in the way of famine and so on, that very likely have contributed their share to this result.

11,992. Also the Indian manufactures at home?—Very likely that also.

11,993. What would you say of exports in the present season? Would you regard them as being on a favourable scale compared with average years?—The last three years they have been steadily diminishing.

11,994. But take the present season—what should you say?—You have had better crops following upon a time of famine; but I think in a broad question of this kind, no one can safely rely on one year or two years; you need a longer average in order to illustrate how a law operates.

11,995. Would not the restriction of currency be operating now with increased force? Now that the mints have been closed for six years, would not one expect a marked and visible diminution of exports at this moment?—I would not say marked; I would not expect marked. Last year, for example, there was a great impulse given to the export of wheat, not from anything special in India, but from the great rise in price which took place in this country for some time, which again originated in the brain of one distinguished man in Chicago, Mr. Leiter.

11,996. Which would you view as the more important condition, exchange, or those other influences which you speak of?—It seems to me that, if you raise the rate of exchange, you introduce an element which is bound to tell—to tell steadily always and increasingly against India as a producing and exporting country. That is the law. I would not wait for statistics, or expect statistics to do anything else than illustrate that. The law appeals to us as certain to act always.

11,997. And you would regard statistics as proving it so far as they go?—I am not quite sure that they would *immediately*; but in the long run they would.

11,998. But up to now?—Well, I think you need a broader average to give you reliable evidence.

11,999. (*Sir A. Dent.*) You advocated imposing a duty on cotton goods to benefit the Indian revenue, and you also advocated that the duty should be taken off tea in this country?—Oh, no.

12,000. You do not advocate that at all?—Not at present. I think the Government of this country is well enough guided in its fiscal arrangements. I would be glad to see the tea duty taken off, but I am merely putting it as an illustration of the different way in which the Government of this country proceeds, and the way in which the Government of India has proceeded.

12,001. The great object of putting a duty on tea in this country is, I take it, to levy a tax upon a certain part of the population who would otherwise not be taxed at all?—That is so, and it is perfectly legitimate, I admit.

12,002. I thought you advocated the removal of the duties here, and I was going to say that it is very doubtful whether the planters in India and Ceylon would favour that. Now you say that silver is a good standard for India?—I think it has been a good standard for India.

12,003. Does that mean that you are against a gold standard in any form?—I am against a gold standard, certainly, at the ratio.

12,004. (*Chairman.*) The question is, are you against a gold standard or not?—Well, I am against a gold standard.

12,005. You are against a gold standard altogether?—Yes.

12,006. (*Sir A. Dent.*) Then you favour 1*s.* 1½*d.*, as being a natural rate of exchange, and you think that profit on coinage would be more pardonable at that rate than at 1*s.* 4*d.*?—I do not regard 1*s.* 1½*d.* as a natural rate. The natural rate, I should think, would be about 11*d.*

12,007. But 1*s.* 1½*d.* would be a more natural rate than 1*s.* 4*d.*?—A more natural rate. I take it as the middle betwixt the natural and artificial rate now existing.

12,008. You point also to the large increase in the production of gold and the way in which the production of silver is, anyhow, not increasing. If the Indian Government were to fix their limit of exchange now too low—for instance, if they fixed it now at 1*s.* 1½*d.*—but some 10 years hence it should be found that that was a very improper rate, owing to the relative production of gold and silver, what do you think would happen?—Then the cure would be easy. They would open the mints and bring about the natural level. That would be a solution, I think, perfectly possible and desirable; although, as it is prophetic, I would not like to be sure of it. I should be very glad to see exchange at 1*s.* 4*d.* if it came about in consequence of silver rising in gold price.

12,009. But the object of the Indian Government is of course to have gold, and they could not throw their mints open to the world and get their gold?—But I was assuming that we were not to have a gold standard.

The witness withdrew.

Note subsequently handed in by Witness.

May I be allowed to refer to the universally acknowledged help that railways give in delevoping India? The evidence of Sir A. P. Macdonell before the Committee on that subject is alike interesting and instructive. But after all what can they do? They may *cheapen* transport to the sea-board by 10, 15, or at most 20 rupees, or a maximum of 1*l.* 6*s.* 8*d.* per ton. But a 1*s.* 4*d.* rate of exchange *adds* 35 or 40

Mr. W. Duncan.

15 Feb. 1899.

rupees, or a maximum of 2*l.* 13*s.* 4*d.* per ton, to the gold price of ordinary produce, while on tea it adds at least 14*l.* per ton.

We give to the people of India good government, and, so far as human power can avail, we protect them from the three great providential scourges of war, pestilence and famine, so that they are increasing at the rate of 8,000 every day. But, if we condemn them to a deeper poverty by interposing a prohibitive finance betwixt them and the foreign market for the produce of their labour, where is the blessing?

In illustration of what I have said, that we cannot *create* wealth by any financial device, though we may relieve one interest by burdening another, let me submit the following figures. Taking exports at 70,000,000*l.*, imports at 52,000,000*l.*, and Government remittances at 18,000,000*l.*, the comparison stated in millions stands thus:—

		Differences.			
	At 1*s.* 4*d.*	At 1*s.* 1½*d.*	At 11*d.*	At 1*s.* 1½*d.*	At 11*d.*
	£ Rx.	Rx.	Rx.	Rx.	Rx.
Exports -	70=105	124½	153	19½	48
Imports -	52= 78	92½	113½	14½	35½
Government Remittances	18= 27	32	39½	5	12½

Thus to save 300 millions of people from paying taxes amounting to Rx. 12½ millions = 6⅔ annas each, we have put a tax of Rx. 48 millions upon 180 millions of the poorest, which amounts to 42⅔ annas each. My proposal is to relieve those 180 overburdened millions, to the extent of Rx. 19½ millions, by putting Rx. 5 millions upon the whole population; that is to say, I would burden all who share in the benefits of good government, to the extent of 2⅔ annas each, in order to relieve three-fifths of their number—the poorest—to the extent of 17⅓ annas each. This is an argument based on equity, and is quite apart from the all too reasonable fear that under the present disabilities to exports the balance of trade may so seriously diminish as to produce an absolute deadlock. The *tendency* must be in that direction though it may only be after prolonged suffering that the result becomes unmistakable.

Then, in regard to the great loss which the Government of India sustained as a producer of opium in 1897, compared with 1896, I hold it to be demonstrable that the loss was due to the Government's financial policy more than to any or all other conceivable causes put together. The point is important chiefly as an illustration of the way in which the interests of other producers for export are prejudicially affected by that same policy, for their positions are analogous.

WALTER DUNCAN.

Mr. J. E. O'Conor, C.I.E.

Mr. J. E. O'CONOR, C.I.E., recalled and further examined.

12,010. (*Chairman.*) I will first of all ask you one question about a statement made by the last witness, Mr. Walter Duncan. Speaking of Bengal opium, he says that in 1896 the Government sold 39,000 chests for a gross sum of Rs. 51,165,550; and, in 1897, it sold the very same quantity, which realised only Rs. 40,901,985, being Rs. 10,263,565 less?—The fact is that the price of opium is a most fluctuating thing. It is the most speculative trade in India, so much so that it might even be called a gamble. In 1897 the Marwaris were not able to gamble as freely as they had been able to do when the rate of discount was lower, the stringency of the money market restricting their operations, with the result that the active competition of ordinary years was absent. This was the main cause of the fall in price, but there has been a recovery since.

12,011. What is the price now?—In September 1897 the price was 968 rupees a chest, in September 1898, 1,079 rupees; in October 1897, 984 rupees, October 1898, 1,073 rupees; November 1897, 987 rupees, November 1898, 1,134 rupees; December 1897, 1,040 rupees, December 1898, 1,138 rupees.

12,012. That is about a 10 per cent. rise all round?—Yes.

12,013. Have you got the quantities sold in 1898?—We are selling and exporting more than in 1897. Of Bengal opium the number of chests sold up to April 1897 was 3,250 a month; from April down to December 1898 the number was 3,400. In connexion with the export trade we must take into consideration Malwa opium. The trade does not consist of Bengal opium alone; there is a large quantity of Malwa opium, and Malwa opium has revived considerably after a period of great depression extending over some years. There is a much larger export of Malwa opium from Bombay this year than last year. The exports of opium in the first nine months of the present year, compared with the same period in the two preceding years, are:—

	From Calcutta. Chests.	From Bombay. Chests.
1896–97 - - -	29,030	17,534
1897–98 - - -	29,361	14,106
1898–99 - - -	30,778	19,084

12,014. You say that the stringency of the money market prevented the Marwaris from borrowing money for the purpose of speculating with it. Now that the market is resuming its normal conditions, there is nothing to indicate that opium is being affected by the rate of exchange?—Nothing at all. Business operations and speculation have been actively resumed. Perhaps you will allow me to point out that during the years when the mints were open the price of opium was frequently much lower than it is to-day or was in 1897.

12,015. In your evidence before us last July, you were asked a question with reference to the allegation that the closing of the mints has caused great dissatisfaction in India. Would you say whatever you have to say upon that point?—I said that no such evidence was forthcoming. We examine the native press with the greatest care in India from week to week, and, if there is anything causing dissatisfaction among the people, we hear of it from the native press as well as from other sources. We never heard at all that there was such dissatisfaction. The native press always makes itself promptly heard if there is any kind of a grievance or dissatisfaction, and the subject is kept permanently before the public. Neither from the native press nor from other sources has there been any indication of dissatisfaction with the action of Government in closing the mints. A witness before this Committee demurred to that remark, and pointed as evidence of dissatisfaction to a resolution passed by the National Congress last December. I have that resolution here, Mr. Wacha, of Bombay, a Parsee gentleman, who has written extensively on the currency question for some years past, moved the following resolution—

> "(*a.*) Resolved, that, having regard to the fact that the principal cause of the loss by exchange is the steady growth in the demands on India for expenditure in England, this Congress is of opinion that any artificial device for meeting that loss, either by changing the currency at a heavy cost, or contracting the internal currency, must add to the pressure on India's monetary resources and to her trading disadvantage.
>
> "(*b.*) That the only real relief is carrying out practically the principle, affirmed by competent authorities, of England bearing an equitable share of that expenditure.

"(*c.*) That the Congress regrets that, save Mr. Romesh Chunder Dutt and Mr. Merwanji Rustomji, competent and qualified Indian representatives have not yet been invited as witnesses to represent the Indian view of matters on the subject which now engages the attention of the Currency Committee, of which Sir Henry Fowler is the President.

"(*d.*) That the President be authorised to request Sir W. Wedderburn, Chairman of the British Congress Committee, to communicate the foregoing Resolution to Sir Henry Fowler, Chairman of the Currency Committee in London."

That is the Resolution of the Congress, passed in Madras, on the 29th December 1898, which was pointed to as evidence of dissatisfaction. I have been looking through the annual proceedings of the National Congress to see what it has said from time to time upon currency matters, and this is what I find. In December 1892, during the agitation for the closing of the mints, the Congress resolved:

"That, having regard to the diversity of opinion that prevails on the currency question, and the importance of the question itself, this Congress desires to express its earnest hope that, unless its hands are forced by the action of any Foreign Power, necessitating a change in the currency or the standard, which might prove injurious to the interests of the country, the Government of India will refrain from taking any steps until the labours of the Brussels Conference have been completed; and, further, that the Government will lay before the public for discussion the proposals which Lord Herschell's Committee may recommend, before definite action, if any, is resolved upon."

In December 1893, after the mints were closed, Mr. Dadabhai Naoroji being in the chair, it was resolved:

"That this Congress places on record its deep regret at the recent hasty legislation of the Government of India closing the Indian mints against the private coinage of silver, whereby the people of this country have been subjected to further indirect taxation of a burdensome and indefinite character, and some of the most important trades and industries, notably the mill industry, have been seriously disorganised and injured."

Between December 1893 and December 1898 the National Congress did not revert to the subject. In December 1898, the resolution read just now was preceded by only two speeches, which were made by Mr. Wacha and Mr. Iyer. Those speeches may be called in effect mere political speeches.

12,016. You still retain your original opinion that there is no general dissatisfaction existing in India upon this question?—If there had been any dissatisfaction we should not have been left to hear of it more than five years after the closure of the mints from a resolution passed by the National Congress. When I gave evidence before, I remarked that there were no expressions of dissatisfaction, although attempts had been made from England to incite to such expressions. An illustration of my meaning occurs in connexion with the resolution of the National Congress to which I have been referring. It appears from the report of the proceedings that the following telegram was sent, though unnecessarily, to the Congress:—"From the Royal Exchange, Calcutta, "Mr. Forbes Mitchell" (described by the Congress Chairman as "a well-known gentleman of Calcutta "and friend of India"): "Mr. Barclay, Chairman "of the Manchester Chamber of Commerce, hopes "that the National Congress will protest against "the gold standard." On receipt of this message a copy of the resolution was sent to Manchester, as the Committee were informed.

12,017. (*Lord Balfour of Burleigh.*) What inference do you want us to draw from the fact that there was nothing done between 1893 and 1898?—That there was no dissatisfaction in the sense in which the word has been used before this Committee.

12,018. (*Chairman.*) Now we will go to the question of illicit coinage. We should like to hear what the Government of India have said in respect of illicit coinage of rupees. Will you state their views and give us the evidence on which it was based?—I have here a despatch from the Government of India, dated the 12th January 1899, in which they send all the information they had. The following paragraphs contain the gist of the despatch:—

"We have already, in reply to your Lordship's telegram of the 28th November, telegraphed the substance of the information at our disposal in regard to cases of illicit coinage recently discovered. We now beg to say that Mr. Henry's remarks attracted our attention before the receipt of your Lordship's despatch, and we made inquiries on the subject. We forward a copy of our correspondence with the Government of Bengal, from which it will be seen that Mr. Henry's remarks as to the likelihood of coins, with the same proportion of silver as Queen's coins, being produced in large quantities were wholly conjectural. For it is now admitted that, although special measures have been taken since the closing of the mints to watch persons previously convicted or suspected of coining, and several hundred counterfeits have been collected by the police in Bengal, only five false coins have been detected in the last five years the composition of which approximates to that of genuine coins.

"We may further add that, in connexion with the remark made by the Chairman of the Assam Branch of the Indian Tea Association, in his letter of 20th June 1898, a copy of which was sent to your Lordship with our Financial Despatch, No. 235, dated the 4th August 1898, we caused inquiries to be made as to the alleged circulation of spurious coin in Assam. We enclose a copy of the correspondence with the Chief Commissioner. His inquiries are not yet complete, but all reports yet received from district officers, some of whom have made most minute inquiries, tend to show that the number of spurious coins in circulation in Assam is very small, and not increasing.

"We beg to enclose a copy of a memorandum we have caused to be prepared of all cases of counterfeit coinage which have been specially brought to our notice within the last year or so. The evidence afforded thereby in no way justifies the fears that have been expressed as to the possible production on a large scale of counterfeits containing a high percentage of silver, nor is there any evidence of a large increase of silver counterfeits in the experience of the Calcutta Mint, to which specimens of the counterfeits discovered in Bengal and Northern India have been sent for assay. During the past year the Assay Master, Calcutta, received for assay 205 counterfeit coins, of which 101, very nearly 50 per cent., contained no silver whatever, while 104 contained silver varying in proportion from 6·08 per cent. to 90·50 per cent., the standard for genuine rupees being 91·66 per cent. We append a table showing the proportion of silver found in each of the 74 whole rupees assayed.

"We also wish to bring prominently to your Lordship's notice that, with the exception of six coins struck between dies (all of one batch) which were recently detected by the National Bank in Calcutta, all the counterfeits discovered have been cast in moulds, and that this method of manufacture is too laborious and slow to admit of coins being produced in sufficient quantities to constitute a danger to the currency of the country. The origin of the one batch of coins that were struck has not yet been discovered, but it seems to us in the highest degree improbable that the machinery required for turning out coins in large quantities could be imported and used anywhere in British India without immediate detection.

"We remain, therefore, of the opinion expressed at the close of our telegram of 26th December, that there is no evidence of counterfeiting on any appreciable scale, and we think with your Lordship that the

Mr. J. E. O'Conor, C.I.E.

15 Feb. 1899.

re-appearance of coins of the earlier issues is due to hoards being brought into circulation owing to famine, and also, perhaps, to the stringency of the money market during recent years, and to the attraction of purchasing cheap silver bullion."

The Chairman of the Indian Tea Association, at a meeting in June last year, remarked that the amount of spurious rupees in circulation in Assam required the serious attention of the Government. Thereupon, the Government of India asked the Chief Commissioner of Assam to report whether spurious coin was circulating in Assam, as was alleged. After elaborate inquiry, he answered to this effect:—"The "Chief Commissioner believes that there is very "little counterfeit coining in Assam of a kind which "would be likely to deceive a person of ordinary in- "telligence and education. The remark of the "Chairman, Assam Branch, Indian Tea Association, "which you refer to in your letter under reply, "appears to have been based on the discovery of "certain coins which were not counterfeit, but "genuine rupees that had been tampered with or "sweated, and must have been brought into Assam "from Calcutta. This was the effect of a report by "the Master of the Mint on the coins which Mr. "Buckingham sent him for examination. I am to "add that the Inspector-General of Police, Assam, "and other officers whom the Chief Commissioner "has consulted are also of opinion that there is no "great circulation of spurious coin in the Province."

Among the reports that the Chief Commissioner sent in were several from large tea companies and from the manager of the Assam Railways and Trading Company. He wrote:—"About 10 spurious rupees "only have been found by the chief cashier during "the last 14 years amongst their receipts, which "amount to about Rs. 67,000 monthly in cash alone. "They have not experienced any increase in spurious "coin amongst their large takings from the railway "and other ventures of the company during recent "years." Similar answers were given by everyone consulted — managers of stores, planters, officials, managers of tea companies, managers of trading companies, bankers, and so on.

12,019. Then you still adhere to the view you expressed when you were before us last year?—Yes, and in addition to the official evidence supporting that conclusion, I have evidence obtained privately. In a letter from Mr. Lindsay, now acting manager of the Bank of Bengal, he says, "I can get you from "Hyderabad any number of illicitly coined Halli "Sicca rupees made of pure silver; but they will be "of no use to O'Conor, as the Farrukhabad coinage "case proves that native State coins can be readily "imitated by ordinary village silversmiths. What "O'Conor wants, I presume, is a counterfeit of the "British Government rupee, made of pure silver, "and you may tell him that the cash department of "the Bank of Bengal have never come across any "coins of the kind." I am informed also that Messrs. Ralli Brothers, who have very large transactions in cash, have found no such coin, though they find the ordinary counterfeits such as have always been made, in the usual small proportion. Mr. John A. Anderson, a member of a mercantile firm in Calcutta, has sent me 17 samples of counterfeits, containing a varying proportion of silver. He informs me that it took three weeks to collect this small number, though banks and brokers were engaged in the collection. With them he sent me a report by Colonel B. Scott, C.I.E., Master of Her Majesty's Mint at Calcutta, from which it appears that, of the 17 samples, one was genuine, but it had been used to hang on a necklace, and was mutilated; of the other 16, one only was struck in a die, and it was struck so badly that when it was put into circulation it was rejected.

The difficulty in striking coin in a die is that the coiners have no sufficient stamping power to do the thing properly. When done by hand, owing to the hardness of the metal, the impression is probably indistinct, and, if a second impression is taken, as was done in this coin, it is blurred and the coin is open to suspicion. Further, without the machinery collar, which does the milling at the same time that the reverse and the obverse are struck, the milling must be done separately by hand, and it is necessarily imperfectly done. Of the 16 rupees which I have here, 15 were cast in moulds, and, as the Government of India point out, there is no danger to be apprehended from cast coins, the process being slow and crude. This kind of coining is limited to the small and poor class of professional coiners, and it would be impossible for them to make any appreciable addition to the coinage before they were discovered and apprehended.

12,020. Then the net outcome of all that is that no appreciable increase of counterfeit coin has been discovered?—That is so.

12,021. And there is no reasonable ground for apprehension in the future?—None.

12,022. It has been suggested that one result of closing the Indian Government's mints might possibly be that the depreciated coin of native States would drive out the appreciated rupee from the British zone surrounding the native States. On a previous occasion you gave the Committee figures to show that the coinage of the native States had been on such a restricted scale that this result need hardly be regarded as serious. Have you any more recent information on this point?—We have received from the Government of India figures showing the quantity of silver going into the native mints during the first nine months of the year 1898. These supplement the figures of the quantity passed in to the end of 1897, which will be found among the Financial and Statistical Tables printed for the Committee (*see Appendix*). During these nine months of 1898 the total quantity passed into the native mints was only 2,889,263 tolas. At this rate, if it should continue for the rest of the year, the coinage of the 12 months will be 3,611,578 tolas. A tola is the weight of a rupee. Moreover, very nearly half of this quantity is the re-coinage of old coin, so that the coinage of the native States during the present year has been less than 2,000,000 tolas.

12,023. All the native States?—All the native States. In 1897 it was 8,000,000; in 1896, 12,000,000; in 1895, 11,000,000; in 1894, 8,750,000. The only large quantities were in 1892 and 1893, when 15,000,000 and 20,000,000 were passed into the native mints. There has been a gradual falling off since 1893, and it seems evident that there is no need to suppose that British coin is being, or will be, superseded by the coin of the native States.

12,024. You told us that two States, Kashmir and Bhopal, had ceased coining. Have any others ceased coining since you gave your evidence?—Yes, Gwalior also has ceased to coin. Gwalior is much the largest State of the three. Both Kashmir and Bhopal have withdrawn their own currency altogether and taken British India rupees, and Gwalior is now doing the same thing.

12,025. Was there any compulsion put upon either of those three States?—Absolutely not.

12,026. It was done entirely of their own free will?—Entirely. I happen to know exactly what happened in Kashmir, for I was in Kashmir myself for two months in 1897. Kashmir formerly was practically almost inaccessible to Europeans, but a road was recently constructed which enabled people to go from Rawalpindi to Srinagar with ease in three days. There has since been an increasing crowd of visitors to the State, who come with British Indian rupees. A branch of the Punjab bank was established there which also did its business in British Indian rupees. Soon everybody, even the natives of the country, refused to take Kashmir rupees, and the State Treasury was filled with the local coin presented in payment of taxes. The safes of the bank were also filled with Kashmir coins, which its customers declined to take. The State found itself loaded with a great sum of rupees which were practically bullion, and application was made to the

Government of India for advice and assistance. The Government was ready to prevent the State from falling into serious financial difficulty, and an arrangement was made under which the Government took over all this Kashmir coin at a value materially above its bullion value, British Indian rupees being given in exchange. Of course it had to safeguard itself by requiring that the State should not coin more native rupees. The Maharajah willingly accepted that proviso. He did not forego his right of coinage, he merely waived the exercise of that right for a specified period. The state was anxious to make the arrangement, which gave it complete relief in a difficult juncture.

12,027. (*Mr. Campbell.*) For how long a period did he waive his right to coin?—Fifty years. We feel satisfied that before the end of that term the State will have fully recognised the advantages of a unification of the coinage, as it has already recognised the advantage of the unification of the Post Office and telegraphs.

12,028. (*Sir A. Dent.*) If the native States call for British Indian rupees, do they get any share of the profit?—Of what profit?

12,029. The profit that the Government make on coining?—The Government did not make any profit on this. They made a loss in fact. They took over the native coin when they might have bought bar silver in Bombay much cheaper—they took the native coin at a higher rate, and recoined it into British Indian rupees, and gave the State the equivalent of the native coin in British Indian rupees.

12,030. But with regard to any future transaction, is there any arrangment as to sharing profit?—There is to be no future transaction. After this replenishment of the currency, the native State will get its supplies of British Indian coin in the ordinary course of trade as British districts do. The Government will not coin specially for any state.

12,031. (*Sir C. Crosthwaite.*) Was the Maharajah of Kashmir a minor at the time?—He is a man of mature age, probably not under 40.

12,032. Was his State in any sense under British management at the time?—Not in the least. The Maharajah for a time was under a cloud, and was put aside.

12,033. That is some time ago?—That is some time ago. A Council of Regency was established, but he was reinstated some years ago, and he governs now with a Council consisting of his two brothers and a minister.

12,034. This took place after he had regained his powers?—Yes, three or four or more years after. There is no ground whatever for the suggestion that there was compulsion in the matter.

12,035. (*Chairman.*) What have you to say about the other States?—The Begum of Bhopal, as Sir Charles Crosthwaite knows, is one of the most intelligent rulers in India, and one of our best friends. She found the State suffering from a depreciation of the currency, and came to the conclusion that the best thing was to get rid of the currency on the favourable terms that Government had offered to Kashmir. Like Kashmir she asked for advice and assistance, and readily accepted the offer of the Government.

12,036. Her rupees were at a great discount, were they not?—A very great discount.

12,037. And after she adopted our mintage and took our currency, did she revise her revenue at all?—I do not know. I cannot say what she has done with regard to that.

12,038. What have you to say about Gwalior?—Gwalior is in rather a different position. In Gwalior three different currencies were in circulation, each of them legal tender only in a certain part of the State. In some districts also the British rupee was current and legal tender. The State found it had got into serious difficulties over the system. One currency was insufficient, another was excessive, and the third was so small that nothing satisfactory could be done with it. The Maharajah came to the Government of India for advice, and the Government, instead of suggesting that he should follow the example of Kashmir and Bhopal, advised that he should begin by reforming his currency—making all his different rupees legal tender everywhere indiscriminately. When he had got his local currencies into some sort of definite condition, he might then consider what should be his next step. The Maharajah found himself unable, from local circumstances connected with the assessment of the land revenue, to accept this advice, and, instead of reforming his currency, he decided to get rid of it altogether. The State happens to be wealthy and able to bear the expense. He made no arrangement whatever with the Government of India, but simply, quite of his own motion, withdrew his native currency and substituted British Indian rupees.

12,039. (*Sir A. Dent.*) All this was done last year?—Yes, it is tolerably evident that, having regard to the dimensions of the coinage of native States and to the withdrawal of the coinage of three of those States, there is no fear that native State coinage is intruding on the area in which the British coinage has been circulating hitherto. The reverse is, indeed, the case, as I said when I was under examination before.

12,040. (*Mr. Le Marchant.*) There was no sort of compulsion on Gwalior?—Not the slightest, and no thought of it.

12,041. (*Chairman.*) Have you any reason to think there has been any compulsion put upon any other native rulers, or that they are at all dissatisfied?—Nothing of the kind. We have had nothing to say to them at all. They have made no representation to us, and we have made no representation of any kind to them. They were told in 1893 that the Government would be glad to advise and assist them in any way if they wanted advice or assistance, but they have not asked for advice or assistance. With the exception of these three States, they are going on in their old way.

12,042. Then you do not attach much importance to any allegation that they have been prevented from taking steps in consequence of the action of the Residents?—It is a suggestion that has absolutely no foundation whatever.

12,043. Have you anything to say as to the present condition of Indian trade, especially as to whether there is anything unusual or abnormal?—There was a great deal said last year about the condition of trade being abnormal, but, so far as the trade is going now, I maintain the opinion that I expressed six months or so ago, that there is nothing abnormal in the condition of trade in the present year. We are having a good year on the whole, but, though we have done fairly well in some things, we have not done very well in some other things. On the whole, although there has been some decline in imports and a large increase in exports, I do not feel inclined to anticipate that the increase in exports or decline in imports is abnormal. I would ask the Committee to look at the figures of the period for which we have the accounts, April to November, the first eight months of the year, compared with the preceding six years.

The exports are:—

	Rx. (000's omitted.)
1892-93	71,400
1893-94	68,874
1894-95	75,878
1895-96	73,787
1896-97	70,216
1897-98	65,620
1898-99	77,873

There does not seem to be anything in these figures to justify the apprehension that the export trade is in an abnormal condition.

Mr. J. E. O'Conor, C.I.E.

15 Feb. 1899.

The imports are:—

	Rx. (000's omitted.)
1892–93	52,690
1893–94	60,947
1894–95	54,837
1895–96	55,479
1896–97	59,930
1897–98	59,955
1898–99	56,790

The excess of exports over imports in the same years was:—

	Rx. (000's omitted.)
1892–93	18,710
1893–94	7,927
1894–95	21,041
1895–96	18,308
1896–97	10,286
1897–98	5,665
1898–99	21,083

In 1894–95 there was an excess of Rx. 21,041; and in 1898–99 there is an excess of Rx. 21,083. In 1893–94 there was an excess of only Rx. 7,927, Council bills having been suspended for a part of that year, which may be treated as an abnormal year. In 1896–97 and 1897–98 the excess was also small, Rx. 10,286 and Rx. 5,665. Those two were years of famine and plague—abnormal years, in the latter of which Council drawings were reduced, as in 1893. Looking at the years of normal trade, we find that there is no special excess in the present surplus of exports.

12,044. (*Sir A. Dent.*) You give those figures to show that we are perfectly justified in taking them as the usual condition of trade?—Yes, I think that they may be regarded as normal figures such as we may expect in ordinarily good years.

12,045. Other people point out that in the last five years there has been war and famine, and that now we have come to rather an exceptional year, but, notwithstanding that, you maintain that we are justified in taking these as the figures of the normal condition of trade?—I say that the two years, 1896–97 and 1897–98, were exceptional years. We have now reverted to normal conditions since the beginning of 1898.

12,046. You do not consider this an exceptional year at all?—No, I think it is a normal year.

12,047. Then what do you say to the enormous export of wheat that has governed these figures so largely?—There have been very large exports of wheat before, and the exports really have not governed the aggregate figures of the trade in any marked degree. The increase in these 8 months amounted altogether to 13 crores. The increase in the value of the wheat is eight crores out of the 13 crores; so that there are five crores left.

12,048. Then, rice?—It is an ordinary trade that is going on in rice. In regard to both wheat and rice, the two previous years were exceptional years; there was no wheat to export and the higher price of rice restricted trade.

12,049. (*Chairman.*) Do the conditions of trade justify the apprehension that it may prove to be unequal to the maintaining of the rupee at its present rate? For instance, do you expect a diminution of India's exports and an increase of imports, or a fall in prices?—We have come to an end of the abnormal period, and, although there may be an increase in the imports (as I hope), there will be a corresponding increase in exports. We must pay for our imports.

12,050, And we can only pay for them by exports?—Exactly. The test is in the excess of exports over imports, which is the means of paying the Secretary of State's bills. I am not able at present to see anything which would justify the apprehension that that excess is likely to be reduced.

12,051. (*Mr. Campbell.*) Not in the next four months?—Not in the next four nor in the next 12 months.

12,052. (*Chairman.*) At all events this year has only another month to run?—I should not feel inclined to base any wide inference on the trade of one year only, but I am comparing the trade of the present year with the trade of preceding years, and I find that the trade of this year does not differ essentially in its character or its volume from the trade of previous years, or in the relative proportions of imports and exports. So that on the whole I conclude that we can stand the rate of 1*s.* 4*d.*, which has prevailed this year, in future years.

12,053. I suppose the balance this year will be quite sufficient to pay for all the remittances to London?—No doubt.

12,054. Will there be any surplus beyond that?—Well, there ought not to be. If there were any surplus beyond that, it would mean outflow of capital from India.

12,055. (*Mr. Campbell.*) Any surplus would probably be taken in bulllion?—Perhaps so, but not necessarily.

12,056. (*Chairman.*) It has been stated here, on the authority of an official report from the Straits Settlements, that the closure of the mints has changed (to the disadvantage of India) the course of trade between India and the Straits, discouraging exports from India and encouraging exports from the Straits. What are the facts in respect of that allegation?—That statement was made here by a witness in answer to question 11,686.

12,057. Yes. A Straits Settlement Consular report was quoted which said, "the success of the experiment "of closing the mints in India has favoured exports "to that country while diminishing exports therefrom "to places with a silver standard," and the witness says, "I can give several reports showing that the "effects are very great"?—It was a report from the Acting-Governor of the Straits, who stated, as a sort of *obiter dictum*, that rice and opium, which are the two things constituting the bulk of the exports from India to the Straits, had fallen off, and on the other hand that the exports from the Straits to India had increased as the result of the closing of the mints. The statement shows the danger of generalising from the trade of a particular year. The Acting-Governor was writing of the trade of 1897, which was the famine year in India. The bulk of our trade with the Straits consisting of rice, the exports fell off, because the price of rice in India doubled. We had indeed to import rice, and we took a considerable quantity from Singapore, which was used as a depôt for rice produced in the further East. Now take the figures from 1892–3 and let us see how the exports of rice to the Straits come out. The exceptional nature of the year will at once be apparent if we look at the course of the rice trade for some years. The exports have been (in cwt.) as follows (eight months of each year):—

1892–3	1,693,304
1893–4	1,753,042
1894–5	2,856,997
1895–6	3,844,442
1896–7	2,629,882
1897–8	1,241,044
1898–9	3,994,246

The exports during the present year are the highest on record. In 1897 there was a temporary diversion, not merely a diversion, but a reversal of the flow of trade due to temporary causes. Again, the opium exported from India to the Straits in the same period has been as follows:—

Chests.	
8,465	8,849
9,967	8,262
10,704	10,159
8,274	

12,058. What do you say as to the fall in the exports of opium?—In 1895–6 a very low export was coincident with a very low exchange. 1896–7 and 1897–8 were years of famine and plague, and of

monetary stringency; there was in consequence a restriction for the time being in the export of opium, but that has passed away and we are now back again in the flow of the ordinary tide.

12,059. And so far as the year 1898, at all events, is concerned, the rate of exchange of 1*s.* 4*d.* has not discouraged exports from India, and has not encouraged exports from the Straits?—Our exports to the Straits have been, in fact, larger than ever before during this present year.

12,060. Similar statements have been made in respect of China. Can you tell us whether there has been any particular decline of the Indian trade with China?—There has certainly been a decline in Indian trade with China. As I have frequently had occasion to point out in writing my Reviews of Trade, our trade with China has, unfortunately, been a stationary or declining trade for the last quarter of a century or more, but it is noticeable that it is not our exports to China which have fallen off, but the imports from China to India. Now, if the closing of the mints had anything to do with the conditions of trade between China and India, there should have been a restriction of exports from India and an expansion of exports from China to India, which was what the Governor of the Straits thought had happened in the trade with the Straits. It has been just the contrary. If you will allow me I will show you what the imports have been during the last five years from 1893—the year of the closing of the mints—to 1897-8. The figures are:—

Rx.
3,542,556,
2,662,957,
2,805,858,
2,149,089,
1,691,012.

12,061. (*Sir A. Dent.*) What is that chiefly made up of?—We get raw silk chiefly; some copper and tea, the last mainly for re-export.

12,062. (*Chairman.*) That is a steady decrease?—Yes, it is a steady decrease. Then our exports are:—

Rx.
11,129,322,
12,695,448,
13,949,290,
13,818,583,
12,226,990.

12,063. (*Sir A. Dent.*) That is mostly opium?—Opium and cotton yarn. Opium is so predominant a factor in the trade that it must of necessity affect totals materially, and yet, even with that, we do not find any decrease, except in the last year of the series, when the export trade was affected by the fall in the price of opium, to which reference has already been made. In the present year that trade has revived. It may therefore be said that since the closure of the mints there has been no decline at all in our exports to China.

12,064. China always imports more, does she not?—China always imports a great deal more from India than India imports from China.

12,065. How is the balance made up?—By transactions here.

12,066. Do you include treasure in your figures?—These are for merchandise only. I have the figures for treasure here also, and the result, with or without treasure, is practically the same.

12,067. In your original figures, was the treasure included?—I have it here.

12,068. That is silver bullion?—More gold than silver. There has been little silver sent by China to India in recent years.

12,069. Gold bars?—Gold bars and leaf gold.

12,070. You cannot say what proportion of silver and what proportion of gold, can you?—Yes. I have the figures. They are as follows:—

VALUE of the IMPORTS of GOLD and SILVER from CHINA.

	Gold.	Silver.
	Rx.	Rx.
1893–94 - -	969,398	138,029
1894–95 - -	460,537	47,723
1895–96 - -	370,792	17,605
1896–97 - -	451,067	15,639
1897–98 - -	774,540	136,289
Total -	3,026,334	355,285

We are now exporting silver (British dollars) from India to China (Hong Kong).

There is clearly no indication in the trade with China of that decline in our exports to China and increase in the exports from China to India which ought to have taken place if the closure of the mints had been the only factor, or a main factor, in the trade. I should like to observe here that, although our commercial intercourse with China is not increasing, and has not been increasing for the last quarter of a century, what we may have lost in the China trade has been more than replaced by the development of the trade with Japan. Our commercial intercourse with Japan has increased enormously in the last few years, and, looking at the accounts since the year of the closure of the mints, the augmentation of our trade with Japan is three times as large as the decline in our trade with China.

12,071. (*Sir A. Dent.*) That is largely made up of raw cotton?—Yes.

12,072. (*Chairman.*) Have you anything to say as to why what has happened with regard to China is the opposite of what has happened with regard to the Straits?—The inference I draw is that in neither case has the closure of the mints had anything to do with either the course or the volume of trade. The course and the volume and value of trade depend on considerations which are quite separate and apart from any questions of currency. Currency in the long run has no effect whatever on trade between two countries.

12,073. (*Sir A. Dent.*) The starting of many cotton mills in Japan has created the Japan trade entirely?—That is the principal reason for the development. Japan has entered upon the ways of civilisation, progress, and industrial enterprise. China is still practically what China was a hundred years ago. The result is that Japan, which formerly did hardly any business at all with us, now does a large business, and it may be anticipated that a few years hence our trade with Japan, will exceed in volume and value the trade with China. If China were to enter on the same road as Japan, no doubt our trade with that country would expand as our trade with Japan has expanded.

12,074. Do you expect to export as much cotton to China as you have to Japan?—Yes. I do not believe that China is capable of growing cotton in quantity sufficient to feed a considerable number of mills. China has always been an importer of Indian cotton, and, if a large number of mills were established there, I am sure they would have to come to us for cotton.

12,075. That is an open point, is it not? People say that China can produce any amount of cotton in the Yangtse Valley?—We have heard much of the dense population of China. If the statements made are correct, China must be far more densely populated than India, and, outside the area required to produce food for the population, there cannot be room for any large cultivation of cotton or other commercial products. However, apart from that, I have no hesitation in saying generally, that, if China were to enter upon the same road as Japan, we should certainly have a very largely increased trade with China. The more prosperous our neighbours are, the better for our trade.

12,076. (*Chairman.*) In other words, you are not in the least apprehensive that the commercial development

Mr. J. E. O'Conor, C.I.E.

15 Feb. 1899.

of China would be any disadvantage to India ?—Quite the contrary. I should like very much to see the commercial development of China.

12,077. I should like to call your attention to some articles that have appeared in the *Statist*, in which it is argued that the importance of the fall in exchange has been exaggerated, in consequence of the official ignorance of the Government of India. Two of these articles are signed by a writer calling himself "Monometallist," and one by Mr T. Lloyd. There are several allegations made. The first is "That only "about a third, or about six millions sterling, of the "Home Charges are chargeable to the general "revenues of the country . . . The other two-"thirds of the Home charges, or about twelve "millions sterling, are assignable to the immense "commercial business in railways, irrigation works, "forests, and telegraphs carried on by the Govern-"ment." In another passage, which I will read to you, the *Statist* criticise the supposed views of the Government of India :—"The argument of the Indian "Government is, that it has to pay in gold in London "every year what are called the Home charges, "amounting, roughly, to about 18 millions sterling, "and that the loss by exchange on these payments "is a serious burden to India. If, the argument goes "on, the Indian mints had been kept open, the rupee "would now be probably under a shilling, whereas, "little more than a quarter of a century ago, it was "worth two shillings. Therefore, twice as many "rupees as were needed a quarter of a century ago "would, in that case, have now to be raised in order "to make the payments in London . . Or, to put "the matter a little differently; if the mints were "now open, the Indian Government contends that it "would have to raise by taxation at least twice as "many rupees to pay the Home charges as it had to "raise when the rupee was at 2*s.*; and, now that the "rupee is at 1*s.* 4*d.*, that it has to raise, by taxation, "15 rupees for every pound sterling payable in "London, whereas, formerly, it had to raise only "10 rupees. Lastly, the Indian Government alleges "that India is too poor to bear the taxation that "would be necessary if the mints had not been closed "or were now to be opened. In answer to this, "'Monometallist' points out that, as a matter of fact, "out of the 18 millions sterling, or thereabouts, "payable in gold in London yearly, only about one-"third—or, say, six millions sterling—is payable out "of the taxes; whereas about 12 millions sterling—"or, say, two-thirds—are payable on account of the "purchase of stores and materials." What have you to say about this criticism of the position of the Government of India?—I should like to begin by saying that the Government of India has never said that India is too poor to bear the additional taxation which would be required if the mints were re-opened. The Government of India has said that it is not right or politic that such taxation should be imposed upon India, and that, if it became necessary to impose taxation, it would be difficult to obtain the amount required, except by new and objectionable forms of taxation. The position of the Government is that such taxation should not be imposed, if it can be avoided, because it is not good policy for a Government to be constantly seeking to increase the burdens of the people, even if they are capable of bearing additional burdens. Another reason for the objection is that taxation for this purpose, that is to say, for the purpose of meeting the decline of exchange, differs essentially from taxation spent in the country for useful purposes; here, the revenue collected is remitted out of the country, and no return is obtained for it. Further, it might be necessary to increase the burden with reference to administrative needs, and, if taxation is levied up to the hilt for exchange, there is no reserve to fall back upon for administrative needs until some considerable time elapses. The process would be that taxation would be imposed for the sake of keeping the mints open to silver, it might become necessary to increase it for the same purpose with a new fall in the price of silver, it might be necessary to increase it for administrative purposes, and the position of the Government would be that of lying in wait to impose new taxation from period to period, as each series of developments and improvements made the people more prosperous, taking from them a portion of their earnings from time to time, when it became evident that they had more earnings. That is an Eastern rather than a Western notion of good government. The Government of India prefer that there should be a stable currency, so that they may be able to regulate taxation with reference to the needs of the country, not with reference to the production and profits of silver mining. A further reason is that such taxation must almost of necessity take new forms, an impolitic thing in itself in India, while the effect in practice would be doubtful. I wish to observe that, in the article to which I am referring, it was stated that "the receipts from general "taxes in India increased from Rx.15,650,000 in "1873–74 to Rx.23,540,000 in 1893–94, the increase "not being due to imposts, but generally to the "increased productiveness of existing taxes." It was shown before this Committee, it was also shown before the Royal Commission on Indian Expenditure, that the statement is untrue, large additional taxation having been imposed.

12,078. Then we come to the statements, "that only "about a third of the Home charges are chargeable "to the ordinary revenues of the country," and that "the other two-thirds of the Home charges, or about "12 millions sterling, are assignable to the immense "commercial business carried on by the Govern-"ment?"—That is not correct. Analysing the figures, as given in the budget of 1898–99, we find that for general administration the charge is 10,586,800*l.* sterling, while for railways and irrigation the charge is 7,949,900*l.* Let us call the figures 10½ millions for general administration and 8 millions for railways and irrigation.

12,079. The £8,000,000 you appropriate to railways, and irrigation, and military stores?—Everything.

12,080. Telegraphs, and so forth?—Yes.

12,081. In fact you might call it the commercial part of the business?—Just so.

12,082. Locomotives and railways?—Yes; stores and interest, and everything connected with what are called commercial services.

12,083. The argument appears to be that the price or cost of this £8,000,000 ought not to come out of revenue, but ought to be provided out of the great industrial enterprises in which the Government are interested?—Yes.

12,084. That is stating their argument fairly, is it not?—Yes.

12,085. Now will you give us your answer to that?—We have to find rupees in India for all the Home charges, however the accounts may be split up or divided, or the nature of the transaction disguised. Now, suppose the mints were opened, and the rupee went down to 1*s.*; at 16*d.* we must find the rupee equivalent of the £8,000,000 for railways in Rx. 12,000,000. At 12*d.* we must find Rx. 16,000,000, an excess of Rx. 4,000,000. The rupee equivalent of the other 10½ millions at 16*d.* and 12*d.* respectively is Rx. 15¾ millions and Rx. 21,000,000, the excess being Rx. 5¼ millions. On both sums it would be an excess of Rx. 9¼ millions. Well, let us assume for a moment that we find the excess 4 crores on railways and irrigation from increased rates, but we must also find 5½ crores on the other side from general taxation. The present revenue from taxation (excluding land revenue) is just under Rx. 30,000,000, so that an addition of 20 per cent. at least must be made to it, for the yield from taxation does not increase in exact proportion to the increased rate, and probably 6½ or 7 millions of Rx. must be assessed in order to obtain 5½ millions; this would be an excessive increase of taxation. The Rx.4,000,000 for railways and irrigation and commercial services would also entail the addition

of more than 16 per cent. to present rates and fares, if equally distributed; but it would not be equally distributed. It suits many of the railways to charge inward traffic comparatively lightly in view to its encouragement and to the reduction of the cost of sending waggons into the interior to fetch down the freight seeking the ports, which is always larger than the inward traffic. They would be averse to raising the rates here, and also to raising the fares for third and fourth class passengers; and, moreover, the earnings from passenger traffic are but little more than one-third of the whole earnings. The bulk of the Rx. 4,000,000 would therefore fall upon the goods traffic, and especially upon the export traffic. Anyhow, it would be on a goods traffic returning about Rx. 16,000,000 that the increased rate would fall, and the increase must be at the rate of 25 per cent. to produce Rx. 4,000,000. Now the consistent cry of all merchants and producers in India is that rates should be lowered; and every Chamber of Commerce joins in the cry. The railways would not object to increased rates, if they thought that the increase would not have the effect of restricting or impeding trade; but they know from experience that a substantial increase has that effect. It should be borne in mind, too, that a large proportion of the railways are worked or owned by companies and native States. At the end of March 1898, out of the 21,245 miles of lines then open, only 5,305 miles were owned and worked by the Government, the rest were owned or worked by companies or native States. In regard to these three-fourths, the Government cannot compel the owners or lessees to raise rates as suggested, and, if the Government could do so, a considerable proportion of the proceeds would go, not to the Government, but to the companies. Trade would be taxed for their benefit, the benefit would be disproportionate (as in the case of general taxation) to the burden imposed, the companies do not want the benefit and would object to the process, and the Government must still, in any case, find the rupees to meet the sterling obligations. All the Indian railways, whether worked by companies, native States, or the Government, are worked on commercial principles, which may be stated broadly thus. Rates are fixed with reference to competing traffic, whether by rail, by river, or by road, and with reference to capacity of development. They are fixed low to attract traffic in goods which are easily handled, are conveyed in bulk, go over long leads, and are likely to increase under the stimulus of low rates. As high rates as can be paid without checking or stopping the trade are charged on other articles. Rates are varied according to the time of year and the openings for trade. Passenger fares are charged on such a scale as will induce the people to use the railway instead of the road. All these decisions have in view the working expenses on the one hand, and the conditions of the country traversed by the line on the other hand. The question of exchange does not, and cannot, enter into the consideration of the rates to be charged. Assuming, however, for a moment that rates and fares might be regulated with reference to exchange, and that it would be possible to vary them as rapidly as exchange varied, without on the one hand incurring what is said to be a loss, and on the other charging unnecessarily high rates, the operation is in its essence the imposition of taxation in disguise. It is also taxation of a very bad class, because unequal in its incidence, imposed on a class, directly striking at a section of trade which it is desirable to keep free from restriction, and because a material proportion of the proceeds would not reach the Government treasury but would go into private pockets. The idea seems to be that, by dividing off the accounts into two sections, a saving can be made. On this point Sir Henry Waterfield writes: "To any "intelligent student of the accounts this division of "the home charges is absurd. The railway charges "consist of guaranteed interest and re-payment to "railway companies of capital previously deposited "by them; and the Secretary of State can in no way "avoid the charge for exchange on these sterling pay- "ments by dividing the accounts into two portions. "The payments to public works and telegraph officers "on furlough or duty in this country, are administra- "tive charges. And even with the stores, a very "large portion is for the army, and must be obtained "from the War Office in order to ensure similarity "of pattern; so that any contention that the saving "in price makes up for the charge for exchange must "be limited to, perhaps, one-tenth of the home charges, "at the outside. . . . The writers seem to be "under the extraordinary hallucination that, by "splitting the accounts into two sections, it would be "possible to turn a loss into a gain, and so avoid the "increase of taxation. They also hold that a reduc- "tion of net receipts or increase of charges through a "fall in exchange is not a 'loss,' if there is still a "surplus derivable from the particular work in con- "nexion with which the increased charges occur."

12,086. Then what about the suggestion that stores bought in England are bought more cheaply than in India; that there is no loss by exchange in respect of stores—in fact that there is a gain? What do you say to that?—That is a very curious idea.

12,087. The argument is that there is no loss through a fall in exchange on the purchase of stores in England, because the price paid by the Government is less than it would be if the stores were bought in India, and paid for in rupees. It is said that stores are purchased in England because they can be bought there cheaper than in India, and that this means a gain for India, rather than a loss, and it is declared that Indian officials confound the material gain with a heavy loss. What is your answer to that?—The writers in the *Statist* think that two-thirds of the home charges (or 12 millions sterling) represent stores (stores really, however, only represent two millions), and the argument is that we buy them here because we buy them more cheaply than in India; therefore we actually gain, not lose; if they were bought in India there would be no question of loss by exchange. This suggestion again, like the other we have just discussed, is one to disguise the nature of the transaction. We do our best to buy as much as we can in India, of good manufactured there. We also buy a considerable quantity of articles in India which are imported, this being done for convenience in respect of certain classes of goods. But in respect of all stores not made in India, whether we buy them here or there, the question of exchange cannot be eliminated. If we buy them in India, we have to pay a sterling price which the seller charges in rupees at the exchange of the day. In this transaction he takes a certain risk for which he charges in the price, and the Government is under certain disadvantages with reference to the quality of the article and other considerations. It prefers, therefore, (except in the case of goods of certain classes) to buy in England and import direct, saving certain charges; but it can by no means evade, whether it buys in India or England, the cost of translating rupees into sterling. The transaction in either case is essentially the same. An article bought in England costs, say, 1,000*l.*; at an exchange of 16*d.*, Government must find Rx. 1,500; if the exchange is 15*d.* we must find Rx. 1,600. If we bought this article in India we should equally have to pay the importer Rx. 1,500 or Rx. 1,600, plus what the importer thought necessary as an insurance for taking the risk of an unstable exchange. The question in the matter of stores is a question of price and exchange. Assuming the price of what we buy to remain unaltered, each fall in exchange requires that Government shall pay more rupees. If there is a rise in price and fall in exchange, the Government must find all the more rupees; if there is a fall in price, the Government is deprived by the fall of exchange of a portion of the gain from a reduced price; and this happens whether the goods are bought in England or in India, but in a greater degree if they are bought in India. That is the only difference between the two. The suggestion is that, if we bought our stores

Mr. J. E. O'Conor, C.I.E.

15 Feb. 1899.

in India, this question would not arise at all. That is not so, the question is there exactly the same.

12,088. (*Sir A. Dent.*) But these stores cannot be bought in India?—The greatest part of these stores, at least three-fourths, cannot be bought in India.

12,089. (*Mr. Campbell.*) Or they could only be bought in India from an importer?—There are certain army stores which cannot be bought at all in India. We have to buy them through the War Office. Then there are several articles, such as rails and locomotives, and so on, which are much better bought here. If we bought them in India we should have to pay considerably more. In either case we have to pay the exchange, there is no question about that; and buying them in India we must also pay the importer for his risks and profit.

12,090. (*Chairman.*) Now, the next suggestion is that you, as representing the Indian Government, the officials who gave evidence, and also I myself when I was Secretary of State, have all misunderstood the question, and that the accounts are prepared so as to show a heavy loss by exchange, where there is none. What do you say to that?—The writers have been misleading themselves, and are under a delusion. The statement made is that, "The system of accounts is "such that in respect of the twelve millions there "must always be shown loss of exchange equal to the "difference between the current exchange and the "obsolete exchange of 2*s.*, although there might be a "large profit on the undertakings." It has frequently been explained that the Government do not use the term "loss by exchange." The accounts are rendered in Rx., but part of the Indian revenue and expenditure arises and is incurred in England in sterling. In order to show the actual sums received and paid in sterling, they are entered in the accounts with the sum in Rx., which, added to the sterling figure, gives in Rx. the total sum received or paid. This sum in Rx., which is inserted in the accounts, is entered in a column headed "Exchange." Thus, say that the rate of exchange is 16*d.* per rupee, we should have entries as follows, to show expenditure in India and England—

In India	-	Rx.10,000
In England	-	£10,000
Exchange	-	Rx.5,000
Total	-	Rx.25,000

If exchange fell to 15*d.*, the entry would be—

In India	-	Rx.10,000
In England	-	£10,000
Exchange	-	Rx.6,000
Tota	-	Rx.26,000

In such a case, comparing the two years, it would be reasonable to say that the fall in exchange had imposed upon the Government the necessity of finding an additional number of rupees, to meet the fall in exchange, equal to the difference between Rx.25,000 and Rx.26,000. But it is quite an error to suppose that the item "Exchange" is considered or treated as "Loss by Exchange." As regards the imputation of deception, the fact is that the form of the accounts, showing separately the "Commercial Services," "Civil Services," "Military Services," and so on, was devised by Sir Henry Fowler himself, when he was Secretary of State for India. I have in my hand the Summary of Accounts issued with the Budget Statement, and this Summary follows the form which was adopted at the instance of Sir Henry Fowler.

12,091. The table shows the exact amount of Rx. which has to be raised by taxation in India, and which is spent for the purposes of the Government of India?—Yes.

12,092. It is very fully explained, I think, in the preface to the Return entitled "East India (Income and Expenditure)," and there are illustrations, showing what exchange costs us?—Yes.

12,093. I see that in that Return the "charge for exchange" is explained:—"The term "Rx. is used to denote tens of rupees. In "order to ascertain the number of tens of rupees "required to defray a sterling payment, an amount "termed the 'exchange,' must be added to the "latter, varying according to the average rate of "exchange for the year. For example, a payment of "one thousand pounds when the rate is 15*d.* the "rupee, requires 16,000 rupees; and, adding to the "1,000*l.* the exchange of Rx. 600, the total is "Rx. 1,600, which is shown as the charge in Indian "currency." Is there any possible way of stating that more clearly?—I may say that I gave that illustration without having noticed that it was given there already in print.

12,094. It is not put as loss by exchange, it is put in an appendix to the Return as "summary of charges for exchange"?—And we call it simply "exchange." It is merely a method of showing, as you have just pointed out, that the addition of the two together represents the total Rx. that we have to find. That is the foundation for the allegation that the system of accounts is such "that in respect of the 12 millions "there must always be shown loss of exchange equal "to the difference between the current exchange and "the obsolete exchange of 2*s.*, although there might "be a large profit on the undertakings."

12,095. The next point is that the accounts are so compiled that it is impossible to find from them the financial results of the commercial undertakings of the Government?—There again, this charge could only have been made by a person who had not looked at the accounts. They show the "commercial services," so-called, separately, the receipts and expenditure under them, also the net revenue or expenditure, in abstract and in detail, so that the financial outcome of the working of the whole, or of any particular enterprise, may be seen by an enquirer at a glance. Here again I may be allowed to observe that this classification in the accounts was made at the instance of Sir Henry Fowler. One of the accounts in which the information is given is the Return made every year to the House of Commons of Net Revenue and Expenditure of the Government of India, and on the back of that return is the name of Sir Henry Fowler. It is for sale to the public at the price of 7*d.* In this Parliamentary Paper we find the whole of the commercial services, post office, telegraphs, railways, irrigation, and the total of the net receipts or charges for commercial services, each given separately.

12,096. So that everybody can find out exactly what everything is gaining or losing?—Exactly. Then in the financial statement presented by the financial member of the Viceroy's Council annually, when the Budget is published, there is a statement E., "Statement of net revenue and expenditure—India and England." In this is entered all expenditure and income under each of the different headings. "Debt "service, military service, collection of revenue, com-"mercial services," under this last head being shewn the net expenditure on railways and irrigation and the net receipts from the post office and telegraphs. That table was also devised by Sir Henry Fowler. In the Finance and Revenue Accounts of the Government of India, Tables 1, 2, and 3, contain the railway revenue account, the irrigation account, and the others shown separately. In Table No. 49A of these accounts, the particulars are given for each railway separately with the net loss or gain to Government, including everything. In Table No. 49 there is a detailed account showing the revenue and expenses of each railway, and a column showing the "Percentage of net receipts on capital for each railway." Similar particulars are given in other tables in these accounts for irrigation works; so that any one looking at the returns can see for himself, if he chooses to spend a few minutes over them, exactly the position of each railway and irrigation work in India separately, and of the whole of them collectively.

(Adjourned.)

TWENTY-NINTH DAY.

Thursday, 16th February, 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR.

THE LORD BALFOUR OF BURLEIGH.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

Mr. J. E. O'CONOR, C.I.E., recalled and further examined.

Mr. J. E. O'Conor, C.I.E.

16 Feb. 1899.

12,097. (*Mr. Campbell.*) You expressed yourself yesterday as of opinion that, after some abnormal years, the trade of India has returned to its normal condition, so far as can be judged from the trade of the eight months from April to November?—Yes, fairly normal conditions.

12,098. During those eight months the surplus of exports over imports was how much?—I think I mentioned it yesterday; it is 21 crores. I compared the surplus with the surplus in the same period of several previous years.

12,099. Twenty-one crores is larger than it has been for some years back?—Yes.

12,100. How far back have you to go to find so large a surplus as during the past eight months?—The surplus in 1894–95 was almost exactly the same as it is this year.

12,101. The exports this year have been increased by unusually large shipments of wheat and rice?—I would not call them unusually large shipments; the exports of rice are large compared with the two preceding years, and the exports of wheat have been large compared with the last three or four years, but not large, really, as compared with former normal years.

12,102. What was the value of the wheat exported in those eight months?—About $8\frac{3}{4}$ crores.

12,103. How far back have you gone to find the corresponding volume of export of wheat?—There was quite as large a volume, I think, in 1890–91.

12,104. That is the year of the Russian famine?—Yes.

12,105. That, of course, was abnormal?—Yes; still we have only exported in the first eight months 16,000,000 cwt. If we export to the end of the year as much as 20,000,000 or 22,000,000 cwt. it will not be anything particular, for that quantity has been shipped before in ordinary years. Then, as against the export of wheat may reasonably be placed as a set-off a reduction in other things which will, no doubt, all things going well, largely increase next year.

12,106. To what things do you refer?—Jute is one. I understand that the area under jute this year has been restricted by reason of the greater profit of growing rice.

12,107. The crop this year is a small one?—Yes.

12,108. Do you anticipate that it will be larger next year?—Yes, I am informed from Calcutta that that is the expectation.

12,109. Now, what were the exports of rice in the last eight months?—9 crores 40 lakhs.

12,110. How does that compare with eight months in the previous years?—If it is compared with the eight months of the two preceding years, it is enormously larger; but in those years we did not export rice at all. Compared with other previous periods it is not exceptional.

12,111. Then will you go further back?—I can go further back, a great many years. I have not got the figures here, but I know that it is nothing really exceptional. I have the figures from the year 1893–94, not for eight months, but for the 12 months; 10 crores 24 lakhs, 13 crores 69 lakhs, 13 crores 43 lakhs, 11 crores 85 lakhs, 11 crores 58 lakhs—those last two are the two bad years.

12,112. 9 crores 40 lakhs for the eight months is rather above the average?—That is so. We shall have a very good rice year on the whole. I should not call 13 crores 69 lakhs and 13 crores 43 lakhs above the average. These five years do not form an average, because there are two quite abnormal years in them. You would have to go back another five years to get a fair average.

12,113. Between November and March two at least of these months are very heavy export months?—January, February, and March are three months of very good exports.

12,114. So that the four months from November to March are more than half the other eight months?—It may be; I should not be inclined to attach any very great value to an expectation of that kind. In the first place we know that the crop in Burma has not been quite as good as we could have wished; then, in the next place, prices have fallen.

12,115. Would you admit that these large shipments of rice and wheat have had a considerable effect in maintaining the rate of exchange up to the neighbourhood of 1*s.* 4*d.*?—No, I do not feel inclined to think so. If they go on, then we may look to the same factors operating in future years.

12,116. Providing the shipments continue equally large?—Yes. I take it that in regard to rice and wheat we may assume that the present year will be practically a normal one. That is to say, the trade is not likely to be in excess of that of future years, so far as one can prophesy. Assuming that we have good harvests in India during the next few years, as we generally do after a bad famine, we shall continue to have a good export trade.

12,117. Now, as regards the effect of a high or low exchange on trade and prices, I should like to draw your attention to some remarks in the recently-published "Review of the Trade of British India for the five years up to 1897–98," published by the Government of India, and compiled by Mr. J. A. Robertson, Officiating Director-General of Statistics to the Government of India. The first remark to which I wish to draw your attention is on page 2: "A very noticeable feature in the last year's "export trade is the general fall in the values of all "the important staples except grain, of which the

Mr. J. E. O'Conor, C.I.E.

16 Feb. 1899.

" price was kept up by the scarcity of food. In some " cases this can be traced to special causes, such as " over-production "?—May I venture to say, to begin with, that that refers to the year ending March 1898. It is a long time ago now.

12,118. Quite so. "But," the writer says, "the " rise in the exchange value of the rupee must " have tended to this result." Then, on page 3, the writer refers to the imports of gold and of silver; and he remarks: "The receipts of both " were extraordinarily large, and this is the more " remarkable in view of the contraction of the " export trade and the impoverishment of the country " by the famine. The purchases were doubtless " largely speculative, *the rise in the exchange and* " *the fall in the price of silver making the trade* " *profitable*"?—In regard to that remark, I may say at once that I understand that, although the country generally was impoverished, there were parts of the country which benefited in an extraordinary degree by reason of the famine. The cultivators in the western part of the North-Western Provinces, who grew good crops in irrigated tracts, sold their products at extraordinarily high prices; and they invested their profits in gold and silver, as is the habit of the people whenever they make sudden profits.

12,119. I suppose there was greater inducement to do that, inasmuch as the rise of exchange reduced the rupee price of gold and silver?—That may be.

12,120. Then, at page 33, the remark is made: " A small trade is done in the exportation of kerosine " oil from Burma to the Straits, *but owing to the* " *unfavourable exchange it was considerably less* " *last year*"?—That is a very small trade. I should not have made any reference to it had I been writing that report.

12,121. It may be a small trade, but a principle can assert itself in a small thing as well as in a large?—No doubt.

12,122. However, you do not agree with that?—No.

12,123. I only want to bring out that some other high officials of the Government do not agree with your views?—No doubt you may say that. In regard to those matters also, as I observed when giving evidence before this Committee last year, exchange may have an effect on particular transactions, and during a limited period; but exchange does not determine trade generally. The course of exchange will determine whether a transaction may be effected at a particular moment or not; but in the long run, over a whole year or more—and I have the great authority of Sir David Barbour in support of that position—it is the condition of trade which determines the course of exchange.

12,124. There is no doubt they act on each other. Then something was said yesterday as to the Budget statement tending to give a wrong idea of the amount of revenue derived from taxation through the inclusion in the statement of the gross figures of receipts and expenditure in certain departments. Take railway receipts and expenditure on pages 72 and 73 of the Budget Statement. There is included on the receipt side Rx. 21,823,000, and on the other side Rx. 23,931,000, showing a net result of about Rx. 2,000,000; but the Budget is thereby swollen to the total revenue of Rx. 99,000,000 on the one side, and Rx. 98,000,000 on the other; which would give any casual or superficial observer the idea that India is taxed to the extent of about 20 millions more than she really is?—No doubt a casual or superficial observer might come to that conclusion.

12,125. There are a good many casual and superficial observers only too ready to come to that conclusion?—We do the same as Her Majesty's Government does with reference to the Post Office and Telegraphs and a large number of services for which the receipts are not in the nature of taxation, but in the nature of payments for services rendered. That cannot be avoided. If you want to make an analysis you have to go from this general statement, which is an abstract statement, to the further detailed statement in which everything is classified. The very next statement gives you the classification on page 74.

12,126. It would take a long time to wade through all that?—Sir Henry Fowler's return makes it perfectly clear. It is not possible to instruct the casual and superficial observer, and neither in India nor in any other country are accounts or statistics constructed for him. There must be sufficient instruction to enable men to go behind the mere figures and apprehend their meaning. In this country Her Majesty's Government inserts receipts and expenditure in the postal and telegraph departments in the accounts because the figures must be brought before Parliament. Our accounts also, by statute, are brought before Parliament, and the same system applies to us. I think all Governments everywhere frame their accounts in the same way.

12,127. Now you referred yesterday to the particulars given in the budget statement of the results of the various undertakings carried on by the Government, such as the Mint and Post Office, and so on. There is one important undertaking of which the Budget statement takes no notice whatever. I mean the Currency Department?—We do not show it in the abstract general statement, but the figures are included, perhaps under the head of minor departments.

12,128. No, it comes under the head of interest?—No doubt you are right. I am not sufficiently intimate with the details to say.

12,129. But you know no reason why that Department should not have a heading to itself as well as the Mint?—The question is one of relative importance. If there is any call for its separate exhibition, I have no doubt the Government would be inclined to enter it separately. It is entered separately, however, in the Finance and Revenue Accounts, which are the final and detailed accounts of the revenue and expenditure of India. The figures in the Budget statement are only in abstract and are ephemeral and preliminary. At page 68 of the Finance and Revenue Accounts you will find an "account showing receipts and charges in the Paper Currency Department for the year."

12,130. But, if the Mint *is entitled* to a separate heading of its own, why should not the Currency Department have one also? The Currency Department gives a bigger revenue to the Government than the Mint does?—I do not know why it should not be done. If you wish it done we can convey that view to the Government of India. It is, as a matter of fact, shown in the accounts. The Budget statement, of course, is more or less an estimate and an abstract.

12,131. You are aware that the Government derives a large revenue from the Currency Department?—I would not call it a large revenue. It does get a revenue.

12,132. The report issued by the Department itself shows what the revenue is?—Yes. The total net profit as entered in the accounts in 1897-98 is 24 lakhs.

12,133. (*Chairman.*) Appendix III. in the Return of Net Income and Expenditure shews the revenue derived from the interest of securities held by the Paper Currency Department, together with the interest on loans by the Government to port trusts and municipal bodies and advances to land-owners, and so on?—When abstracts and preliminary accounts are made, considerations of space arise. At a later period the fuller details are given. Everything is shown in the Finance and Revenue Accounts.

12,134. (*Sir A. Dent.*) Can you give us a table showing the course of exchange during the last ten years between India and the three places, Shanghai, Hong Kong and Singapore?—I am afraid I have not got that here.

12,135. It bears rather on the opium question that we were discussing yesterday. It is easily got from the local papers, of course?—I have got the exchange rates between India and China, that is Hong Kong rates, since the closure of the mints. Before the

closure of the mints the exchange kept practically steady. I think it was 224 rupees for the 100 dollars.

12,136. Hong Kong will do?—I have got that since the mints were closed. The variations, of course, have been enormous. The following are the figures:—

RATE OF EXCHANGE in BOMBAY on HONG KONG
(Rupees per 100 dollars.)

Month.	1893–4	1894–5	1895–6	1896–7	1897–8
April - -	—	185 8/28	194 6/28	188 9/28	162 2/28
May - -	—	195 21/30	197	190 21/30	164 24/25
June - -	—	195 21/30	197 21/30	190 18/28	164 21/42
July - -	197 4/7	197 16/28	199 7/27	189 3/8	157 3/4
August -	198 17/27	195 9/32	199 2/28	186 47/50	143 7/12
September -	197 19/27	194 3/8	198	183 9/52	141 2/28
October -	197 5/36	195 4/21	196 3/32	179 11/18	149 9/26
November -	190 9/11	192 67/100	195 23/52	169 8/21	151 7/40
December -	190 22/28	190 71/88	188 18/28	167 7/16	157
January -	188 19/24	190 35/48	187 3/4	167 12/28	147 7/44
February -	189 20/21	187 37/46	186 4/28	166 27/46	143 5/24
March -	175 1/28	188 11/26	186 6/13	163 80/100	141 1/14

12,137. It shows curious fluctuations?—Yes, very great fluctuations, with a constant tendency to decline to the end of 1897–98, the latest period for which I have figures.

12,138. It is up now?—Because silver is steady.

12,139. (*Mr. Le Marchant.*) You expressed the opinion that trade conditions as favourable as those of the present year, in which the exports of wheat and rice have been large, may be expected to prevail over any ordinary series of years. Can you point to facts shewing that Indian exports are elastic and that deficiency in some is compensated for by increase in others?—That happens very frequently. In fact, so far as wheat and rice are concerned, if we have some decline in either, the aggregate of trade is not appreciably affected; there is always something else to compensate. This year there is jute, with a large decline amounting to well over Rx. 2,000,000. I have no doubt that next year, if wheat should fall lower than this year, there will be a considerable expansion in the export of jute, assuming that there is a good crop. We have such a variety of climates and products in India, that that is what always happens, unless, as occurs once in 20 years or so, we have a real disaster, a general drought over extensive areas of the country.

12,140. Can you infer from the returns of the area under cultivation that the tendency is for crops to increase?—It is rather difficult to base inferences on our agricultural statistics, which are extremely imperfect. If I were to depend only on the figures we have, I should say there was distinctly a tendency for crops to increase; but we keep adding new areas to the statistics, and you have to make allowance for this. But we know that the population of India has increased, and has been fed and clothed; also that the export trade has increased, by reason of our capacity to send more exports out of the country; therefore, there must have been increased production.

12,141. What would you say of improved means of communication? Does the railway system bring produce more directly into channels conducive to exportation?—In a great many cases the construction of a railway has given an export market to a large area of country which had no export market before that railway was constructed.

12,142. Can you trace the effect of that in the comparison of local prices with prices at the ports?—They run fairly enough together now, though in former years there were great differences. But the effect of railways on prices in the interior of the country is, I think, most shown by the uniformity of levels in recent years, compared with the differences of levels that existed in former years. Wherever a railway has been laid, there the prices of the tract served by the railway have always risen to the level of prices not only in surrounding tracts, but in regions which might be regarded as remote.

12,143. Have you any observations to make about the course of prices recently?—When I was here before, I pointed out to the Committee that there had been a material increase of prices in the interior of India, dating from about 1885. Then came the famine period, with a further very large, but temporary and exceptional, increase. I took seven food grains, the principal grains of the country, rice, wheat, jawar, bajra, ragi, gram, and barley, and gave what might be called an index number (700) to the price of these for 1873. I showed that the index number for the period 1891–1895 was 913; the figure for 1886–1890 having been 826. Then came 1896 and 1897 with a very high range of prices. By June last year the number was 1,000. Now, at the end of November 1898, the level has come down to 862. This number is 41 per cent. less than the number in 1897, and 21 per cent. less than the number in 1896; but it is only 5 per cent. below the number of 1891–1895, and it is 4 per cent. higher than it was in the years 1886–1890. I wish to lay some stress upon this point, because these comparisons show the futility of attempting to deduce any conclusion from the course of Indian prices over a brief period. A witness before this Committee compared the prices of 1894 and 1895 with the prices of, I think, 1891 and 1892. He pointed to the relatively lower prices in the two years 1894 and 1895 as proving the assertion that the currency was restricted and inadequate. Though there have been three good crops in India since the famine, yet prices at the end of November last were still ranging at a much higher level than in 1894 and 1895.

12,144. The prices of food grains?—The prices of food grains. Sir Antony MacDonnell the other day made a speech in Cawnpore, in which, referring to the range of prices, he said that prices had fallen to a level as low as any that has prevailed during the last 10 years. He was referring to prices in his own provinces. If prices had fallen uniformly all over India in that way, there would be room for saying that there was one general cause for it, and to argue that the currency was the predominant factor in the fall. But, if you examine the details of the changes of prices, you will find that, while in Northern India, where they have had such very good crops since the famine that they have been able to fill up their stores of reserve grain and yet have a considerable quantity for trade, prices have fallen for the moment; in Central, Southern, and Western India and in Burma there has been a relatively small decline from the famine level. This leads to the inference that the existing range of prices is the result of temporary local conditions, and that the result may be modified next year. We cannot draw any conclusions in regard to Indian prices from one year, or two or three years; but, looking back over a series of years, the course of prices up to November justifies one in saying that there has been since about 1885 a general and substantial, and apparently permanent, rise in the level of prices in India.

12,145. How far can you go back for reliable statistics of prices?—In regard to prices in the interior of the country we go back to 1861—no further back than that. In regard to prices of articles which are staples of export and of import, we can go back to 1843 for some articles, and to later years before 1860 for others.

121,46. Has there been a marked change in prices in the interval, taking averages of 10 years or

Mr. J. E. O'Conor, C.I.E.

16 Feb. 1899.

whatever other periods may be convenient?—Yes, export prices for a long period were low. Then there was a rise (because export prices correspond with sterling prices), and 1873, which happened to form the basis of our return—it is the datum level—was a year of what might be called inflated prices.

12,147. For exports?—For exports; so that, if it is argued that there has been no special increase in the export prices since 1873—which is not the case anyhow—the answer is, that year was a year of excessively high prices.

12,148. And comparing it with preceding periods that would be evident from statistics?—Yes, they are all in this book (Prices and Wages in India); in fact, there are no other statistics but what are contained in that book. This book gives, in Table 10, the prices of exports and imports for, in many cases, half a century down to 1898—and those prices (which are actual quoted prices) are given for Calcutta, Bombay, Karachi, Madras and Rangoon. In Table No, 11, I have given the variation on those actual prices, taking the price in March 1873 as the datum level. That is represented as 100, and, if we go far enough back, we find enormous variations and fluctuations, both in imports and in exports, and a general rise—a very large rise as compared with the period antecedent to 1873, and a rise since then.

12,149. You appear to regard export prices as closely corresponding to sterling prices?—Yes, that is for all articles that are mainly produced for export. There are certain articles of which a small quantity is exported relatively to the quantity that is produced and consumed in the country. There, I think, the sterling price has to follow the price of the markets of the country. It is rather difficult to analyse these things, but I should say that articles largely produced for export must be regulated by the sterling price, so far as they are exported to countries under a gold standard.

12,150. Would you apprehend that with a gold standard there would be any change in that respect, that there would be, as it were, an inertness in Indian prices as compared with sterling prices or those in foreign markets?—No, I do not know why prices should be affected at all by a change of standard. Prices depend upon the markets—the supplying market and the consuming market—but Professor Marshall would be much more competent than myself to explain how far, if at all, the standard comes in as a factor in the determination of prices. In my own mind, I do not see why a change of standard should have any real effect on prices, unless the change of standard should affect trade; but I also hold that it does not affect trade and cannot affect trade.

12,151. Have prices shown much mobility of late?—Yes; in fact the fluctuations of prices in India, speaking of export prices, correspond very largely to the fluctuations of prices in other countries.

12,152. With regard to the question of foreign competition, what figures can you give us as bearing on Chinese competition with India?—I was much concerned to find that gentlemen interested in tea were apprehensive of Chinese competition, and I asked a large firm of tea brokers, Messrs. Gow, Wilson, and Stanton, here in London, how the matter stood. They sent me a circular which they issued at the end of the year reviewing the trade in Indian, Ceylon, and Chinese tea for the year. I may remind the Committee that London is the market for nine-tenths of the Indian and Ceylon tea. The imports of China tea are given by the firm as in the last three years 41,169,000 lbs., 39,778,000 lbs., and 33,002,000 lbs.; so that in the year during which the people interested in tea have been lamenting the encouragement to the competition of China tea given by the action of the Government of India, the imports of China tea have materially declined, although exchange ruled during the year at nearly its highest possible level. The deliveries of China tea in this market declined in even greater degree than the imports. During these three years the Ceylon tea imported amounted to 81,870,000 lbs., 92,072,000 lbs., and 93,580,000 lbs.; and Indian tea was 117,932,000 lbs., 131,650,000 lbs., and 135,376,000 lbs. The deliveries have increased in the same way.

This firm write in their circular:—

"The tea-producing industry has been passing through a severe crisis. The worst of the depression appears now to be over, and there are decided indications of a brighter outlook.

"For years past cultivation has been rapidly increasing both in India and Ceylon, necessitating constant reduction in price, which gradually receded, until during 1898 the lowest average prices ever recorded were reached.

"The cost of production in the meantime was greatly augmented; first, by the enhanced price of rice owing to the Indian famine; and, secondly, by the artificial rise in the value of the rupee, so that the margin of profit was thus still further reduced. Home consumption during last winter showed a marked falling off, probably due to the increased use of cocoa as well as to the strike in the engineering trade. Whatever the cause, the result was the consumption of less tea, and consequent accumulation of stock with reduced prices.

"But a marked change has come over the position. Home consumption has again increased and is now greater than ever, some six million pounds more of British grown tea being used during 1898 than in 1897, while the total supply to the United Kingdom appears likely to be little, if at all, above that of last season."

They add:—

"Another feature is now to be taken into consideration. For years past efforts have been made by Indian and Ceylon planters to foster a taste for their teas in new markets, the result being that, whereas in 1890 only 14,000,000 lbs. of British grown tea were used outside the United Kingdom, the quantity had risen in 1897 to 51,000,000 lbs. For the 11 months of 1898 there was an increase of 9,000,000 lbs. over the corresponding period of 1897." That has happened during the period when this Committee has been informed that people interested in Indian and Ceylon tea dread the competition of China not only in the markets of the United Kingdom, but in foreign markets which India and Ceylon desire to enter.

On this question of competition in foreign markets, a member of the firm wrote to me in answer to an inquiry—

"In regard to that point of your letter which speaks of the successful competition by India and Ceylon tea against China tea in countries outside Great Britain, I think what the gentlemen you allude to intended to imply was that they did not think the competition could be carried on at a profit while the rate of exchange remained higher than the intrinsic value of the rupee, as China and Japan would have such an advantage owing to their currency being based on the actual value of their coins.

"At the present time, I think a great deal of the tea which has been forced into these markets outside the United Kingdom has been sold with little, if any, profit to the growers, the increase in production during late years having caused so heavy a drop in the price that it was impossible to get rid of the large quantity of tea grown without some reduction in value, and I think it is this fact which has enabled British grown tea during the last year or so to compete successfully with other growths; but, of course, planters cannot go on growing tea at a loss."

As regards selling tea in foreign markets at little, if any, profit, I believe it is a common feature of trade that the trader who desires to enter a field already occupied by others, has to face a present loss in the hope of future profits. That is what I infer is happening in the tea trade.

12,153. Has the price been falling with the increase of production?—There has been no fall in price;

Mr. J. E. O'Conor, C.I.E.

16 Feb. 1899.

there has been a good recovery, although the quantity placed on the market has increased, so that the outlook is good for the producer.

12,154. In what other products does China compete with India?—I know of none.

12,155. As to the competition of the Argentine Republic in oilseeds, has that been a marked feature of recent years?—The Argentine Republic has increased its exports of wheat and of oilseeds, but neither the one nor the other seems to have affected our trade. Our principal oilseeds are subject to the same conditions of cultivation and seasons as wheat. In the same way as wheat has increased during the year, there has, compared with the year before, been an increase in the value of the oilseed trade of 2¾ crores. We are keeping, in fact, at the fairly high level of the time before the bad crops of the last two or three years. We are not afraid of the competition of the Argentine Republic in the oilseed trade. If, however, oilseeds in India were cultivated by European planters we should, no doubt, have heard as much about them as we have heard about tea.

12,156. Are oilseeds cultivated in India by natives exclusively?—Yes; and the natives go on happily producing and selling.

(*For the evidence given on this day by Professor Marshall, see page* 178 *above.*)

Adjourned.

THIRTIETH DAY.

Wednesday, 1st March, 1899.

PRESENT:

THE RIGHT HON. SIR HENRY H. FOWLER, G.C.S.I., M.P., IN THE CHAIR.

THE LORD BALFOUR OF BURLEIGH.
Sir FRANCIS MOWATT, K.C.B.
Sir CHARLES CROSTHWAITE, K.C.S.I.
Sir ALFRED DENT, K.C.M.G.
Mr. ROBERT CAMPBELL.
Mr. W. H. HOLLAND, M.P.
Mr. F. C. LE MARCHANT.

Mr. ROBERT CHALMERS, *Secretary.*

THE RIGHT HON. the LORD FARRER, called, and examined.

Rt. Hon. Lord Farrer.

1 March 1899.

12,157. (*The Lord Balfour of Burleigh.*) We know, Lord Farrer, of your long experience at the Board of Trade, and your public work generally. What is more germane to this matter is that you were a member of Lord Herschell's Committee which considered the closing of the mints?—I was.

12,158. Are you satisfied by the subsequent experience which we have all had since that time that the conclusions arrived at by that Committee were just and expedient, and that the action taken by the Government was wise?—I am entirely satisfied.

12,159. I understand you have read a good deal of the evidence which has been taken before this Committee?—Yes, most of it, especially the earlier portions.

12,160. Do you see anything in that to shake the opinion which you have just expressed?—No, it entirely confirms me in the opinion I have expressed.

12,161. Would you give us first generally, and then I will take you through it rather in detail, any of the results which the reading of that evidence has left on your mind?—There are certain results which are left in my mind, upon which I am tolerably clear and positive, and there are certain other points upon which I am in doubt. I wish to keep those two sets of opinions separate.

12,162. Then we might commence first—probably that will be agreeable to you—with those results on which you feel able to express a rather more decided opinion?—Very well. The first subject upon which I have a decided opinion is bimetallism. I think that, whatever might have been the merits of bimetallism from an Indian point of view, if it had been possible to make a satisfactory international agreement with a satisfactory ratio, all notion of bimetallism as a solution of the Indian difficulty must, after recent events, be dismissed as impracticable and out of the question. Of course, I refer to the American proposals of last year, and the conclusion to which the Indian Government and the English Government came about them.

12,163. Do you wish to amplify that in any way?—I have nothing further to add on that, unless any member of the Committee wishes to question me. I could, of course, go at length into the subject, but on this as on other points it seems to me that it may be for the convenience of the Committee that I should answer the questions put to me as shortly as possible, subject, of course, to any further questions which may arise out of what I say.

12,164. Would you or would you not contemplate the reopening of the mints to silver under the circumstances in which we are now placed?—That is the second point on which I have a decided opinion. I think it is entirely out of the question.

12,165. Would you give us your reasons for that?—In the first place, because to reopen the mints to silver would be injurious to the trade of India. In the second place, because it would be ruinous to the finances of India, and through the Government and the finances of the Government to the people of India. Lastly, as regards a subject which was perhaps of more importance last year than it is this year—as regards the stringency of money—I believe that reopening the mints would leave the difficulties in that respect quite as great as they are at present, if not greater.

12,166. (*Chairman.*) Would you wish to give any explanation of those three points?—It would be injurious to the trade of India, because, putting aside the exaggerations which have been made by bimetallists in the courses of recent controversies, it is true that a difference of standard between India and

Rt. Hon. Lord Farrer.

1 March 1899

the countries with which she trades is injurious to the trade of India. It is a sort of break of gauge which prevents business from going on as well and smoothly and easily as it would if she had the same standard as the countries with which she principally trades.

12,167. We know that between 80 and 90 per cent. of her trade is with gold-using countries?—That is so.

12,168. And therefore this difficulty you mention arises there?—Yes.

12,169. Then you say it would be disastrous to the Government, and, of course, if to the Government, it would be disastrous to the people of India?—Yes. Of course everybody knows—I need not enlarge upon that—the great difficulties which the Government of India have experienced in consequence of the fall of exchange, and the necessity of getting a larger number of rupees out of the people of India, wherewith to pay the interest on their gold debt. As regards the stringency of money, I think that capitalists who might be disposed to send money to India at the present rate, if they were sure of its being repaid in gold at that rate, would be deterred from doing so if they thought that it might be repaid in depreciated silver rupees. Capital would be prevented from going to India, and the stringency of money would be increased.

12,170. Do you think it is desirable to continue the present condition for a longer time than necessary?—No; that is my third point; I think it is very desirable that, if we do not at once adopt a gold standard and thus put an end to the present period of uncertainty, we should at any rate contemplate an end of it as soon as possible.

12,171. You would hold, I presume, that the present uncertain state of the currency is abnormal, and should be terminated as speedily as possible?—Quite so. It is a state of things in which you have—I do not know how to express it—an anomalous standard, a rupee with a superior limit, and without an inferior limit, as measured in gold.

12,172. In fact, you have a token currency without any standard?—Without any complete standard.

12,173. Now what do you say is the true solution?—The fourth point on which I have a decided opinion is that the only true solution of the question is the adoption of a gold standard of value and a return to an automatic currency based on gold.

12,174. Will you just explain that a little? First, why do you say a gold standard?—A gold standard of course is a different thing from a gold currency. What I mean is that the standard of value should be in India, as it is in this country, gold; that gold should be the thing which has value to which all currency and all values should be referred. I say an automatic currency based on gold, because the ordinary currency of India as far as I understand it—the bulk of the currency of India—must at any rate for a long while be silver.

12,175. Or copper?—Or copper; but I say that it should be based on gold, that is to say, that the silver or the copper should be token currency having a fixed gold value.

12,176. Then you do not agree with the witnesses and authorities we have had before us, who say that for India silver would be a better standard than gold?—No, I do not.

12,177. Will you just tell the Committee upon what you base that opinion?—I base that opinion on the fact that, as far as I can judge, silver is a metal that is going out of use as a standard throughout the world; that it is a metal of which the future value is extremely uncertain; that, as I have said before, India's trade is chiefly with gold using countries, and that it is very desirable that India should have the same standard of value as those countries; in short, that India should have as its standard of value gold; which is becoming (I cannot shut my eyes to that fact) the standard of value all over the world.

12,178. Now, do you think there is anything in the condition of the English money market to prevent the adoption by India of a gold standard?—That is my fifth point. I can see no reason to think so. Any doubt which I may have had on this point had reference rather, perhaps, to the state of feeling which existed last year than to what I believe exists now. There was an idea in the City that the adoption of a gold standard by India might cause dangerous drafts on the London money market and upon the gold supplies in the world. I do not believe that there any reason to suppose that that would be the case.

12,179. (*Sir F. Mowatt.*) Would you define what you mean by an automatic currency?—I mean a currency which can be increased *ad libitum* by persons bringing a certain quantity of the standard metal to the Government and getting it converted into currency.

12,180. (*Chairman.*) Do you mean that every person is to have the right to take it, or is it to be under the control of the Government?—I mean that every person is to have a right to go to the Government with a certain quantity of gold in his hand and be able to say to them, "You shall give me for that a certain number of rupees."

12,181. But is that the state of things in England?—It is not the state of things in England, because everybody is entitled to have the gold coined into gold sovereigns, which are themselves the currency and legal tender. Now, in India, as far as I can understand the matter, you cannot expect to have a gold currency universally there, at any rate at present, and you must have a power of getting rupees.

12,182. But in England it is essential to the transactions of this country that there should be a large amount of silver currency, which is a token currency, of course, but nobody has a right to go to the Mint with gold and say "give me coined silver"?—That is so; but everybody, as a matter of fact, gets as much silver currency as he wants, provided he will give the gold price for it. That is the practice, as a matter of fact.

12,183. The Chancellor of the Exchequer is Master of the Mint. The Chancellor of the Exchequer means the Government, and, therefore, the Government of the day, as I understand, regulate the amount of silver token currency. The practical working of it is this, that they are influenced by the applications they receive from the Bank of England. The matter is really left in the hands of the Bank of England?—That is so.

12,184. If the Bank of England were to show a disposition to increase to an improper extent the silver currency, the Chancellor of the Exchequer can say "stop"?—Yes, but there is not the least risk of the Bank of England acting in that way, or any other bank, and I believe that in procuring silver currency the Bank acts at the instance of other banks; I believe any bank can go to the Bank of England and say, "We want so much silver, and here is so much gold."

12,185. They have no legal right to it, but that is the practice?—That is the practice.

12,186. In India there is nothing corresponding to the Bank of England?—That is another point, to which I will come by and by. But, as regards the principle on which silver currency is issued in England, there is not the least fear of an excessive issue of silver, especially under present circumstances, when the value of silver has gone down, because neither the Bank of England nor any other bank will go to the Mint to turn a sovereign into 20*s*. unless they really want the 20*s*. for circulation; because the silver, except for circulation, is very much less valuable than the gold they give for it.

12,187. Is there not another question involved in it, namely, that sooner or later we may have to arrive at absolute convertibility of silver into gold?—I think it is a defect in our present system that the silver is not absolutely convertible into gold.

12,188. Does not that involve a limitation of the silver in currency?—I do not think that absolute convertibility would involve any greater limitation than exists at present, because a man would be a fool who would go to the Bank or the Mint to turn gold into silver unless he wanted silver for circulation, because the silver when he got it as silver would not be worth half as much as the gold that he gave for it.

12,189. Then, if I understand you correctly, your limitation is that the metal which is to be brought into the Mint, and in exchange for which they are to receive currency, is not to be the silver of which the currency is composed, but gold?—Certainly; I said gold.

12,190. Your limit is the metal?—Yes; the standard metal, gold.

12,191. (*Sir F. Mowatt.*) You define an automatic currency as a currency which can be automatically expanded on the production of the equivalent in gold by an applicant?—That is it.
